MONDAY, Open at Nine. DISPLAY OF GREAT FOUNTAINS.
TUESDAY TO FRIDAY, Open at Ten.
THURSDAY, LICENSED VICTUALLERS' FETE.
 A grander and more brilliant display than ever seen at the Crystal Palace.
SATURDAY, 18th, 9 o'clock. THE GREAT CONCERT OF 2,000 PERFORMERS. Admission Half-a-Crown; Children, One Shilling.
SUNDAY, 19th, 10 o'clock. THE GREAT CONCERT OF 2,000 PERFORMERS. Admission Half-a-Crown; Children, One Shilling.
 Reader, open at 10, to the Crystal Palace, and the usual Agents.
NOTICE.—Half-dinner Season Tickets, available from 1st SEPTEMBER till 30th APRIL, 1861, may now be had, at the Palace, at Exeter Hall, and the usual Agents.

CRYSTAL PALACE.—G. W. MARTIN'S PRIZE GLEES AND NATIONAL PART SONGS.—A Grand Performance, by a CHOICE OF 2,000 VOICES, will take place in the Crystal Palace, on WEDNESDAY, the 26th, and SATURDAY, the 29th of SEPTEMBER. The Band will comprise the principal performers of the North and West of England, the band of the Crystal Palace Company, and numerous additional, professional and amateur. The Chorus will comprise the most choice of vocal societies in the metropolis, forming in all an orchestra of about 2,000 performers. Principal Vocalists: Misses Clara Novello, Misses Norton-Bell, Mr. Walter Cooper, Mr. Jackson, Conductor: Mr. B. Bennett. Tickets of admission, Half-a-Crown each. Reserved seats, arranged in blocks, as at the Handel Festival, Half-a-Crown extra for each day; or a set of admission and reserved seats tickets for the two days, 2s. 6d. may be had at the Crystal Palace, &c., Exeter Hall, or of the Agents of the Company.—Early application for forward reserved seats is required.

CRYSTAL PALACE.—CLARA NOVELLO'S FARWELL TOUR.—TWO PERFORMANCES, on a large scale, of the CREATIONS and MENSAH, will take place in the Crystal Palace, on WEDNESDAY, the 26th, and SATURDAY, the 29th of SEPTEMBER. The Band will comprise the principal performers of the North and West of England, the band of the Crystal Palace Company, and numerous additional, professional and amateur. The Chorus will comprise the most choice of vocal societies in the metropolis, forming in all an orchestra of about 2,000 performers. Principal Vocalists: Misses Clara Novello, Misses Norton-Bell, Mr. Walter Cooper, Mr. Jackson, Conductor: Mr. B. Bennett. Tickets of admission, Half-a-Crown each. Reserved seats, arranged in blocks, as at the Handel Festival, Half-a-Crown extra for each day; or a set of admission and reserved seats tickets for the two days, 2s. 6d. may be had at the Crystal Palace, &c., Exeter Hall, or of the Agents of the Company.—Early application for forward reserved seats is required.

SUBSCRIPTIONS FOR "THE LONDON REVIEW" received by Messrs. W. H. SMITH & SON, at 156, Strand, and at all their Railway Book stalls.

DISSÉ & LUBIN'S SWEET SCENTS.—Frangipanni, Kosa-majuk, White Rose, and others from *exotic flower* that breathe a fragrance, in bottles, 3s. 6d. per dozen, in a case, 7s. Sold by every fashionable druggist and perfumer in all parts of the world.—Laboratory of Flowers, 2, New Boston-street, London.

SCALE OF CHARGES FOR ADVERTISEMENTS.

Free Lines per Line 2s. 6d.

Every insertion, after First Line, 1s. 6d.

Advertisements exceeding One Column in Width are charged in proportion.

THE LONDON REVIEW

WEEKLY JOURNAL.

SATURDAY, SEPTEMBER 8, 1860.

We have now a connected history of the campaign of Garibaldi and his adventurous army since they disembarked on the shores of Calabria. It appears that Reggio was attacked simultaneously by troops marching upon it in opposite directions along the coast; that while the Neapolitan steamers rushed to the rescue, a third army under Cosens crossed the strait in time to join the assailants; and that, finally, the fort was taken by a fourth party under Misori, who descended upon it from the hills, towards which it was completely exposed. With Reggio have fallen a whole string of batteries, which run along the Calabrese coast; so that Garibaldi is now in possession of both sides of the strait, and has secured the connection of his invading army with a base of operations in Sicily. The most important incident in his campaign on the mainland since the siege of Reggio was the capture, on the 23rd, of General Briganti's division, who had taken up a very badly-chosen position on a plain between the hills and the road running along the seaboard, and garden-walls and orchard-trees which hid the advance of their enemies. When the Neapolitans first saw the enemy they opened fire with four great guns, as well as with musketry. There was no answer, however, from the invaders. Garibaldi had forbidden his troops to return fire. The enemy saw that they were surrounded, and a parley was come. Then Garibaldi's presence of mind and promptitude did not desert him. He went down himself among the Neapolitans, and, instead of meeting with a cold reception, was nearly torn in pieces by the frantic admirers who rushed up to embrace him. The enthusiasm of the soldiers reached a crisis when he told them that they might disperse and go home to their families, which they gladly agreed to do, leaving behind them 2,000 stand of arms, 4 field-pieces, and 10 heavy guns. The invaders are, it appears by a telegraphic despatch, dated from Naples on Tuesday, still at Pollino, on their way northwards to Salerno and Eboli, where the decisive conflict with the Neapolitans is expected to take place. In the mean time, General Turri has landed, with four thousand men, in the Gulf of Policastro, half-way between the place where Garibaldi now is and the City of Salerno. The *Patrie* of Tuesday published a telegram, dated from Naples the previous day, stating that the Annexation Committee had received a communication from Garibaldi, to the effect that he would be in the capital on the 8th of September (this day), and in the name of Victor Emmanuel, assume the Dictatorship of the Two Sicilies; that two Sicilian vessels had arrived the same day with troops, and that great preparations were making for a general illumination of the city. This may well be. If Garibaldi really goes to Naples to-day, he will of course proceed thither by sea, leaving his troops behind in Calabria.

The insurrection having broken out to the north of Naples, in the Terra di Lavoro, on the frontier of the Papal States, it is expected that it will spread further to the north on the news of Garibaldi's entrance into the Neapolitan capi-

tal, with his army of invaders. In anticipation of such an event, General Lamoricière has issued an order of the day, directing the Papal troops "to plunder any town that may rise on Garibaldi's approach." The Piedmontese Government, however, have resolved to interfere, should such barbarous measures be resorted to. With this view, and with the purpose at the same time of checking any movement on the part of the adherents of either Garibaldi or of Mazzini against Venice, they are about to concentrate a large force on the frontier of the Papal States, which will intercept the advance of invaders from the south into the plain of Northern Italy.

Two regiments are, it is said, to be despatched from France to Rome to take the place of other troops who are to return, not now, but in the course of a short time. The French army of occupation, which is 15,000 strong, will, according to the *Patrie*, protect the city of Rome; while Lamoricière, with his 30,000 men, is engaged in defending the provinces. According to a more recent statement, the Emperor's instructions to the commander of the French troops is to defend not only Rome, but Civita Vecchia and Viterbo.

The *Monitor* of Saturday applauds the course taken by Prince Joachim Murat in disavowing those who would in his name excite troubles at Naples, and at the same time informs him that the hope he expresses in his manifesto, of being able one day to go to Naples with the consent and support of France, is utterly at variance with the views and wishes of the Emperor. This puts an end to all danger from his interference in the present complication.

There is no fresh remark of interference on the part of Austria; and it may well be that the state of the finances exhibited in a recent balance-sheet has served to damp the impetuosity of the Viennese Court. No important step has yet been taken by the Government on the reports of the committee of the Reichsrath; but tranquillity is still maintained in Hungary, although, according to a telegram of Tuesday from Pesth, it is ascribed less to the measures of the Government than to the perfect unanimity with which the national movement has been secretly organized throughout the country.

In spite of the state of popular feeling in Hungary, the Magyar members of the Reichsrath alude by the opinion that an understanding may yet be brought about between their countrymen and the Austrian Government. They are opposed, however, by a large party in Hungary, who will not be satisfied with anything short of national independence, although it is difficult to see that the Magyar section of the inhabitants will receive any accession of power should the middle basin of the Danube be severed from the German states of Austria, and a state be formed with which the Slave and Rumanian populations of Northern Turkey could scarcely fail to coalesce.

While this is the state of Hungary, very alarming news continues to be received from Bosnia, Servia, and Montenegro. In Servia the answer given by the Porte to the claims made by the Commission to Constantinople, regarding the succession to the crown, the limitation of the fort of Belgrade, and the banishment of Turks from Servia, have not given satisfaction, and Prince Milosh has written to the Central Government, that unless his demands are replied to categorically, he will take matters into his own hands, and enforce the claims of the Servians.

The discontent which prevails in all the distant provinces of Turkey will not excite surprise in the mind of any one who looks into the recently-published "Despatches from Her Majesty's Consuls in the Levant, respecting Past or Apprehended Disturbances in Syria, 1858-60." Feudalism is not the only occasion which must now be brought against the Turkish Administration; it is proved, by an array of startling facts, that the systematic policy of the Turks towards the Christian population of the East, for years back, and down to the recent massacres, has been dictated by religious bigotry, bitter and suppressed feelings of animosity against Europeans, and the savage instincts of a race who have adopted the mere outward gloss of civilization, without being acted upon by its humanizing influences. In the absence of a regular government in Syria, the pashas and villagers appear to have armed themselves, and to have organized a rude justice for the protection of life and property, administered by the petty sheiks, according to old traditions, which they proudly denominated "God's Laws," in contradistinction to the city laws of the Cadi and his books. Among a population differing in race, language, and religion, denied the advantages of a regular police, yet supplied with arms and gunpowder, and encouraged unhandly by the Government, to fight out their feuds, it is not surprising that the long course of villanous intrigue laid bare in these papers should have resulted in the catastrophe of Damascus.

The suspicions entertained at Beyrout, that Fud Pacha would find means to allow wealthy and powerful offenders to escape, have proved unfounded. Seventy Mahomedan civilians, of all ranks, have been hanged; 110 soldiers have been shot, while 3,000 adult males have been forced to enter the army. The official report of Fud Pacha, recording what he had done up to the 30th of August, has been forwarded to Constantinople, and thence transmitted to London, but it contains no fact in addition to those previously heard of in this country through the correspondents of the press.

Four thousand five hundred French soldiers have now disembarked at Beyrout—that is to say, fully two-thirds of the whole expedition. They are encamped outside the city, and their presence has caused a great fermentation in the mountains. In spite of what has been done, murders continue to be committed in various parts of Syria, and dread is entertained of a general rising among the Arab tribes to the south of the districts where the late

outrages took place. The Anglo-American Relief Committee are making great attempts to alleviate the misery of the refugees who have assembled at Beyrout—the organization of hospitals and soup-kitchens having devolved entirely upon our countrymen, in the absence of all assistance from the Turkish Government and the Maronite clergy.

A reply of the American Government to a circular despatch from Lord John Russell, requiring the co-operation of the United States, in measures to suppress the slave-trade, has just been published. It contains objections to a proposed to introduce code in lieu of slave-labour, on the ground that its effect would be to demoralize the negroes now in slavery; and, indeed, it is evident that states which discourage the settlement of free negroes, as an element of insecurity, will not consent to the introduction of another degraded race enjoying privileges calculated to excite the envy of the enslaved class.

Stimulated, perhaps, by the success of Garibaldi, General Walker, a filibuster of the old and true stamp, has undertaken to found a slave-state in the western world, which will encourage and legalize the importation of Africans. At the head of an army of adventurers recruited at New Orleans, Mobile, and other seaports of the southern states, he recently disembarked in Honduras, and took possession of the town of Truxillo, after an assault in which twelve Spaniards were killed and eighteen wounded. He means, he says, to enter Nicaragua, whence he was expelled so ignominiously some years ago, and to establish a government there which will become the firm, servicable, and natural ally of the slave-states.

The most important domestic intelligence of the week is contained in reports received from all parts of the island, that, despite the gloomy forebodings of last month, the grain crops will be of fair quality, and of more than average quantity.

There is a death of political news, the cause, no doubt being that parliamentary celebrities have too recently escaped from the hard work of last Session to think of anything but fresh air and recreation. Mr. Bright, however, from his retreat in Sutherlandshire, writes to the Secretary of the Walsall Reform Association a letter, published in the newspapers of Tuesday last, in which he declines to undertake another campaign during the recess in the cause of Parliamentary Reform. If, he says, the conduct of the Government and the House of Commons during the last Session is not enough to create some expression of opinion from the people, he has small hope that anything will rouse them to self-respect and self-defence. On the ground that no one can undertake to speak at meetings during the recess, and to attend Parliament during the Session, without overloading himself with labour and responsibility, he abandons the agitation in the mean time, recommending his correspondents, however, to stimulate local feelings and local efforts, which alone, he thinks, will ultimately lead to the formation of a strong public opinion favourable to parliamentary reform.

In the absence of all political excitement at home, the Rifle Movement commands such a large share of public attention that we cannot doubt it will soon be numbered among the incidents of the country. Last week a great meeting of the Volunteers of Dorsetshire took place at Monrore, which seems to have been accompanied by balls, public sports, and an assemblage of the gentry of the country, as well as of the classes whose wont it has been to repair to such "gatherings." In an eloquent speech, delivered at the distribution of prizes to the successful competitors, Lord Elcho compared the 150,000 men who had been organized with such elasticity into a great national militia, to the folded army which sprang from the dragon's teeth sown in the ground. He had been told by general officers who were present at the review in the Queen's-park at Edinburgh, that with such a force they would be prepared to go anywhere, and to do anything.

There are three areas situated in distant parts of the empire where the railway system is highly developed, viz., the immediate neighbourhood of the English metropolis, the Lowlands of Scotland, and the great manufacturing districts of South Lancashire and the West Riding of York. The reviews at London and Edinburgh represented the Volunteer Movement in the two first districts. A third great muster, which took place at Knowsley, the seat of the Earl of Derby, on Saturday last, proved that, despite the politics of the Manchester school, the youth of the West of England have entered into the national movement with no less enthusiasm than those of the Eastern counties. The weather was magnificent; the place of meeting was one of the finest old parks in England, stretching in magnificent lawns and glades over an area thirteen miles in circumference; the number of Volunteers who mustered to the "weapon show" was 11,000, while the spectators present were estimated at 100,000; so that, even in the absence of royalty, the demonstration was not much less successful than those of Hyde-park, and the Queen's-park at Edinburgh. The proceedings terminated with a short speech to the officers by General Wetherill, and three "good old hearty English cheers" for Lord Derby.

At the quaint old city of Quebec the Prince of Wales was received on the 18th with great pomp, by the officers of state and the civic dignitaries. He held a levee on the 21st, the same day attending a ball, at which he distributed honours among various leading citizens. On the 24th he arrived at Montreal, where he was greeted with a no less enthusiastic reception. On the following day he held the corner-stone of the great Victoria Bridge, amid the acclamations of the crowd assembled to witness the ceremony. His intelligence, good nature, and urbanity, are extolled by the Canadian and American newspapers.

MONEY AND COMMERCE.

THE happy change in the weather has had an immediate and beneficial effect on all business. It has at once revived hopes, lessened distrust, and increased enterprise. The anticipated further rise in the corn market has been changed into an actual decline. On Monday, at Mark-lane, the price of wheat fell from 2s. to 4s. per quarter, and a similar fall—though it have not yet occurred—is likely to ensue throughout the country. Most also fell in price, making, with the fall which began last week, a difference of 4d. per stone. As confidence was restored, the readiness to lend money was increased, the money market became easier, bills were discounted below the bank rate, there was more capital seeking investment, and the stock and share market immediately improved. The rise at first obtained in the funds and shares was not entirely continued—such changes being, as the rule, followed by a reaction—and the market again became quiet. Something was due to a decline in the funds at Paris, the consequence of the changes going on in Italy. The ease in the money market, both now and prospectively, was increased by a considerable sum of bullion being carried into the bank, and by the probability of less being required wherewith to buy corn abroad.

Every market felt the influence of the fall in the corn market, except the tea market, which is expressed by the great stock on hand, and went backward. For all kinds of colonial produce, except rice, which is governed by the price of corn, and generally rises or falls with it, the demand has been active, and prices have tended upwards. Probably there never was a more sudden and more beneficial change in the aspect of all business, and in the feelings of the whole community, than has ensued from September setting in fine and warm. Unseasonably it was at once an end, and, if we may not hope for the cheapness and abundance of 1858 and 1859, we are relieved at present from all apprehensions of excessive dearth and great scarcity.

This change could have no effect on the manufactures carried on for India and other Asiatic markets, and the last accounts from that country being unfavourable, the reports from our manufacturing districts are not good. There is comparative slackness both in the cotton and iron districts; but the complaints from the latter, particularly Staffordshire and the West of England, are more the consequence of greater and cheaper produce obtained from the northern iron-works than any great falling-off in the demand for iron. The uses to which this metal is now applied are so many and so various, and are so continually increasing, that there is no probability of the producers suffering, except from their own excessive competition to surpass one another.

The fatal accident on the Lancashire and Yorkshire line immediately lowered the value of the stock, and all railway property was slightly affected, making manifest the connection which exists between it and the safety of the public. A large pecuniary fine is, in fact, thus immediately levied for every kind of accident, which is a strong motive for care.

Consols closed on Thursday at 93½, and London and North-Western railway shares at 101, ex div.

At this period of every quarter, when the public funds are closed to make up the accounts, the Bank of England is always ready to make advances on deposits of stock and other approved securities; and as Consols are now closed, the Bank has given the customary notice. Between this and the payment of the dividends in October, the advances on loans by the Bank to the public will be much increased.

It is worth while to place before our readers an account copied from a new edition of "Fenn's Compendium of the English and Foreign Funds," edited by Mr. P. L. Simmonds, F.R.G.S., of the capital of some of the principal securities dealt in at the Stock Exchange:—

| | | |
|---|-----|----------------|
| British funded and unfunded debt | ... | £805,000,000 |
| British railway shares and debentures | ... | 325,500,000 |
| Indian railway shares held in England | ... | 26,500,000 |
| Colonial Government securities | ... | 16,000,000 |
| Indian home loan debt | ... | 6,800,000 |
| London joint-stock banks | ... | 15,500,000 |
| Irish and Scotch banks | ... | 12,500,000 |
| Bank stock | ... | 11,500,000 |
| Insurance companies | ... | 15,000,000 |
| Navy, British and foreign | ... | 1,000,000 |
| Steam companies | ... | 5,000,000 |
| Telegraph companies | ... | 9,000,000 |
| Docks, canals, waterworks, bridges, &c. | ... | 20,500,000 |
| Gas companies | ... | 6,700,000 |
| Total | ... | £1,885,750,000 |

To this the reader may add, in imagination, the amount of funds and shares negotiated in foreign stock-markets, to get a faint idea of the immense amount of this kind of property now in existence.

On the 4th of every month many bills fall due, and when a doubt prevails about the solvency of any class of dealers, this day is always looked to with anxiety. The 4th inst., however, passed off with satisfaction, the bills falling due on that day having been well met.

We regret, however, to see our large failure, that of Messrs. Smith, Beadell, & Co., in the linen trade, and as it is ascribed to the stagnation in this branch of trade during the spring and summer, we fear that it will be followed by other failures.

The leather trade is now entirely recovered from the late disaster.

The gentlemen of Manchester have projected a Joint-Stock Company (Limited) for the purpose of buying cotton in India, and shipping it to this country. It is also proposed to establish a model farm in India for the cultivation of superior cotton. For their interests the supply of this article cannot be too much enlarged and encouraged.

REMINISCENCES OF THE SESSION.

BY THE SILENT MEMBER.

ST. STEPHENS, during the last month of the Session, was given up to the Parliamentary murmur, jay, and parrot. Their screaming and screeching were incessant and deafening. The true songsters of the grove were silent when these tangle and discordant birds woke the echoes.

We had more than enough of talk. Had we any oratory? Did the British Senate maintain its ancient reputation for eloquence during the past Session? Have we any descendants of the Chatham, Pitt, Burke, Canning, worthy to hand down the sacred fire to the succeeding generation? The screech-owl made night hideous in July; the mace was "master of the situation" in August. Was any note of phylloxera heard earlier in the year?

Yes! All through the early months of the Session we were under domination. We were held in thrall. Prospero, with his no potent art, gave us majestic visions, called spirits from their confines "to enact his present fancies," to the "dread rattling thunder" gave fire,—

"And ruffled Zephyr's stout coils
With his own belt."

Lofty tones rang in our ears. We heard great topics treated with the boldness and elevation of a master. A copious, natural, and polished diction, which charmed alike the reticent and the unlearned hearer; a clear, full, and resonant voice; a musical intonation, a perfect elocution, graceful and commanding features, and, above all, a most persuasive earnestness, were among the accomplishments of our great rhetorician. We listened spellbound. From admiring, it was an easy step to imitate. That which seemed so easy to another could not be so very difficult to those who likewise had studied our noble English tongue. It was but to realize great thoughts vividly and express them boldly. The key-note had been pitched high, but our language was a lyre of many strings, which would express all the heights and depths of feeling and conviction. That broad-headed, dark-eyed orator, the lines of whose face are so deeply furrowed by care and study as to give somewhat of griminess to his aspect, is the Plato of our academy, and we are but disciples and learners, who, in admiring his inexhaustible fertility, and his mastery of all the resources of his art, are unconsciously adding to the wealth of our vocabulary, and pluming our wings for higher flights.

Under the eye of such a master, animated by such impulses, and working for such noble and lofty ends, we all felt ourselves to be orators. We were not the rose, but we had lived near the rose, as the garden poet modestly says in the Persian apologue. The great rhetorician had unlocked the strings of our tongues. Even "Silent Members" owned the general influence,—felt that they had something to say, and thought they could say it. I am borne out by the opinions of the best and most experienced judges in the House, when I assert, that for many years the walls of St. Stephens have not resounded to speeches which attained to so high a standard of excellence as those delivered upon the Commercial Treaty with France, the Budget, the Reform Bill, the Paper Duty, and the Constitutional Privileges affair. Upon all these questions one orator stood alone and unsurpassable. If the Greeks had had their own "king of men," to whom a nominal sovereignty belonged, this orator was the Achilles, who carried Trojan with his spear; the dashing Nyr, whose plume was always seen in the thickest of the fight, only to turn the tide of victory. With two or three exceptions, members caught the tone, and emulated the fluency that all admired in Gladstone. They outstripped each other and themselves by their confidence, their energy, their abandon, and their success. Fifty representatives never spoke so well, and yet some of them were no novices, either. Sir Bulwer Lytton's oration on the Reform Bill contained many passages not unworthy of Burke. John Bright never spoke better in the House of Commons than during the past Session, and to his triumph upon the paper alone readily may be added his speeches on Church Rates, the Fortifications, Savoy and Nice. Fractured speakers like Bulwer Lytton, Bright, and our Noble Viscount, may disclaim the contagion of any oratorical plague. But will Du Cane, Ferguson, Black, Stanfield, Bendish, Gregory, Knigklo, Sir Robert Peel, Clay, Maquire, Selwyn, and half a dozen who have won rhetorical laurels during the Session, deny their obligations to His Majesty's Chancellor of the Exchequer? Two distinguished politicians must be excepted. Lord J. Russell's feeble, hesitating, indistinct style is too much a part of himself to be easily changed, and his oratorical deficiencies are now aggravated by a languid phlegm, which makes it almost impossible to hear him. Disraeli, it was remarked, seemed moved by the tone and attitude of the Chancellor of the Exchequer, like the ex-cion of a London drawing-room in the presence of some importation of the newest and fiercest. He struggled, sometimes not unsuccessfully, against the fatal and bewailing influence, and once or twice gratified his followers by some smart sallies, of which Gladstone was the object; but for the most part (unlike other men who caught inspiration and eloquence from the great orator) Disraeli, in the earlier part of the Session, sat subdued, if not silent, and seemed to shrink from encountering this formidable assailant.

When I attempt a critical estimate of Mr. Gladstone's true place as an orator, I shall have to point out the defects of his mental constitution. As the Session wore on he became weaker, repeated times during the past Session, upon the patience of his hearers, could not answer the most ordinary question without an alacrity amount of amplification, and did not know when to sit down. He also became excessively irritable and impatient of the least interruption or contradiction. It must in candour be admitted that he has suffered from ill health during the whole Session. He never recovered the exhaustion consequent upon the attack of bronchitis, which delayed his exposition of the financial measures of the Government. The Session has been replete not only with anxieties, but with mortifications for him. The Opposition had some compensation for the victories he gained in the early part of the Session, by preventing that in his drunk the cry of "humiliation to the dregs, upon the Paper Duty Abolition, the China Vote, and the Fortification Question. Our Noble Viscount, it is now added, has ended the Session by leaving his Chancellor of the

Exchequer. The Queen's Speech, so much of which is occupied to the honour and glory of "Johnny," our Foreign Secretary, contains the baldest and most barren allusion that can be imagined to the great commercial reforms and relaxations, which the eloquence of the Chancellor of the Exchequer so effectively recommended to the House of Commons at the beginning of the Session. Is not this rather shabby of our Noble Viscount? I commend the omission to the notice of Mr. Bright. He might have a worse minor grievance for a speech in the Free Trade Hall at Manchester.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

THE weather—that eternal topic of talk in town and country—has come to engross the attention of speculators since the beneficial change, now almost a week old. The fine weather of the last few days is a real "God-send." If it only last the month out as it has begun, it will relieve a good deal of the damage inflicted by the incessant rain of August, although it will not be able to redress a vast deal of destruction which, I fear, is inevitable. I have had a run during the week through the southern counties of Surrey, Sussex, and Hants. The subject is of so much importance to all, as affecting food and finance, that I may, perhaps, be pardoned for giving your readers the substance of what I saw and heard.

The general concurrence of the farmers inland, and the farmers on the coast, points to a probability of fine weather for a month or more, which will be amply sufficient to save all that remains unsown of the crops of grain and grass. The grain crops are a full month later than usual. Many of them, even in the northern counties, still show patches of green. The second crop of grass will be well saved. The corn crop is heavy, but still in appearance. Even if we have dry weather, it is cold of nights, and morning and evening. We cannot hope for the warmth of a July sun in September; yet the corns are full, and much will be gathered, although much is damaged beyond retrieval. It has been said that a late harvest is generally a large harvest; but this applies to a late spring rather than to the entire absence of summer. However, I find that the farmers complain less than I expected. This may be a great deal owing to the fact that they have prospered well since rain in corn was made perfectly free, and that they have come round to acquiesce fully in the dispensation of things as they are. In a financial point of view, I hope that we shall not be obliged to disburse much beyond the usual amount to our Transatlantic brethren, who have been blighted with long and well-matured crops this year, having had a remarkably dry and scorching season. On the whole, I am disposed to take a hopeful view, although I do not see the wisdom of adopting a triumphant cockle over three days of dry weather, after croaking over three months of almost incessant rain.

So much for the country. The town is duller than ever, and affords little for the passing chronicler to record. The "Boards" seem to have gone on a holiday, at the very time of the year that street improvements could be carried out with the least inconvenience to the public, and when the public buildings could be advanced in beauty and accommodation. The rage for "going out of town" involves every one at the same time, and the one is left to take advantage of the leisure hour, except those who are forced to remain. We shall have the streets pulled up, as usual, when the traffic is at its highest.

The statesmen and legislators are all away. No set of men deserve their holiday more. They have been hard-worked, notwithstanding that there is little to show for it. Lord Palmerston and Lord John Russell have left the English portion of foreign affairs in good train before leaving for the recess. Lord Palmerston remains near London. Lord John Russell is in the neighbourhood of the Queen, and will accompany Her Majesty to Germany, whither she will proceed from Scotland direct, without any of the delay which has been guessed at by parties not well-informed of Court movements.

The non-interference system established for Italy has worked well hitherto, and promises to go on well to the end. Garibaldi proceeds as prosperously that the great body of the English "excursionists" will probably be as late for Vesuvius as they are for Etna, and all the expeditions in the South will be over before they can arrive. There are plenty of men—more than enough to choose from—but the means of conveyance are wanting. The latest accounts from Naples itself are conflicting. Some will have it that everything is ready for the flight of the king, which cannot be much longer delayed. Others give out that he will try the issue of a battle before he finally surrenders the throne. The scene of the conflict is now fixed at Salerno, in the port of Naples, and by some at Capri, in the rear. This last would look like a very last resource indeed. My belief is, that the struggle is virtually over, and in this opinion I am fortified by the best information. The Neapolitan army having abandoned Montecapo without a fight, I cannot think that time can have worked in their favour since. In fact, whole provinces are rising against the Government every day, and every hour adds to the general disaffection, from which the royal army and the officials are not exempt.

The Bonapartes do not fight. They procrastinate, they fly, they temporize, and they betray. Most of the royal family have fled. The king has packed off all his valuables, and is ready for flight at any moment. One of the first to run was the ex-Minister Fieschi (Prince of Sardinia) who was always a time-server, and professed liberal. He left some time back, doubtless seeing that nothing more was to be made out of the falling fortunes of the royal house. The present ministers of the king are neither united nor sincere, and will readily hand over the government to the new Sardinian régime. Indeed, everything seems ripe for this commutation. Count Cavour, with his usual sagacity, has served the very nick of time for direct intervention, and doubtless has prepared most excellent reasons for the decisive action which he is about to take. The English and French naval commanders on the station will not allow any further effusion of blood; nor will they tamely look on at Naples at a bombardment such as disgraced the last days of Neapolitan rule in Sicily. But they may, perhaps, find

it difficult and delicate to interfere more directly, so long as the king keeps up a semblance of rule. The Piedmontese, however, have a more direct interest in the pacification of Italy, and will not be over-declat in their interference, now that the game of the Bourbon dynasty is up.

The landing of 20,000 or 30,000 Sardegnian troops at Naples, in the presence of the ships of war of the other European Powers, would probably be the easiest solution of all difficulties, and would put an end to the further effusion of blood. But yet the settlement of the newly revolutionized territory will take some time, and it is possible that Garibaldi will not be able to turn his attention with sufficient force to the territories of the Pope, outside the immediate circle of Rome. But it is clear that the non-possumus doctrine of *Pio Nono*, so roughly dealt with in the last speech of Count Persigny, will not avail the holy pontiff much longer. If he can have Rome, Viterbo, Civita Vecchia, and Ancona, by the aid of the French army of occupation, it is as much as can be done. The attempts of the half-hearted friends of Italy, to sow discord between Cavour and Garibaldi have signally failed; and these two distinguished men will probably live to see the entire emancipation of their native country, to which they have contributed, in their several ways, more than any other living men.

We have had more than one usual number of murders and suicides in this tranquil autumn time; and the fires in the City have anticipated the gloomy winter, when they most prevail. It is curious to see how these few come round in their accustomed places. The river-side is famous—particularly the wharves in Southwark, and the ship-building yards about Blackwall. Coront Garden, too, has had another turn. The destruction of St. Martin's Hall is to be regretted, if Mr. Hullah have lost his property without being fully insured, or if any of his admirable musical series have been destroyed. But the building itself is no loss to art. Those who are acquainted with the internal arrangements of St. Martin's Hall, are aware of its many inconveniences, and its external appearance was anything but prepossessing. The Gothic style—or the still more assumable attempts at renaissance—are not adapted for music-rooms or public halls.

There has been another victimizing of a joint-stock bank—this time a foreign one, with British capital—much in the same style as the Pallinger frauds upon the Union.

Balfie has finished two acts of his new opera, to be prodiged at the English season of Coront Garden. The libretto is by Mr. Palgrave Simpson, who is talked of as the acting manager of Mr. Alfred Wigan, at the St. James's.

Byrdin said, "I have seen Troy doubled." There is a French architect, M. de Sauter, of the French Institute, a distinguished Eastern traveller, and a consummate archaeologist, who denies the genuineness of the Ninereh Collection in the British Museum. It is not disputed that they are ancient remains, but their authenticity as architectural fragments of the city of Semnehah, and of the Ninereh of the Bible, is boldly questioned. It is alleged that they are the ruins of some Erythraean colony. Their barbarous and inelegant sculpture is adduced in proof of the latter theory, and other evidence is adduced that they are of a later date than the great Christian world has been ready to accept.

THE GOUTY PHILOSOPHER.—No. IX.

MR. WAGSTAFFE GIVES HIS CRITICISMS UPON TITLES OF HONOUR AND DISHONOUR IN BARATARIA.

IF I were the founder and lawgiver of a new republic in Utopia,—which I do not wish to be,—or if I were governor of the island of Barataria instead of Sancho Panza, and had any subjects to govern, I think I should try the effect of a new kind of title upon the manners and morality of my people. I should have titles of honour to reward the good, and titles of dishonour to punish the bad. If a title of honour supposes the existence of honour in or confers honour upon an individual, why should there not be titles of dishonour? If there be majesty in a king or queen, grace in a duke, lordship in a marquis, earl, or baron, excellency in an ambassador, holiness in a pope, reverence in a clergyman, or worship in a magistrate, why should such titles not be reversible in the case of any great or flagrant demerit, which it might be desirable to stigmatize in the eye of the community? For instance, in my Barataria, a man convicted of any scandalous breach of the proprieties and decreencies of life, should be called "Your Irreverence," or "Your Filibuster." An ambassador who had failed in his mission, and sacrificed the interests of Barataria to his own want of common sense or knowledge of his business should be addressed as "His Stupidity." If I had chosen to speak of a pope who had slaughtered his subjects by means of foreign soldiers, I might consider whether he had not acquired a claim to the title of "His Ferocity." A fraudulent attorney or banker should be addressed as "Your Villany." A tradesman convicted of adulterating his goods, or defending right or poor, by short weight or measure, should be addressed in all matters of business as "His Beguery," or "His Rascality." A convicted felon of any kind should all his life long be known to the little world that cared about him as "The Most Ignoble and Very Dishonourable Fidon or Thief," John or Obadiah, as the case might be.

If my people persisted in speaking of His Eminence the Cardinal, I should encourage them to say His Protrulience or His Glutiny, the Alderman—provided always, that the Alderman in question sinned in that particular direction. For it does not follow that a man must be fat because he is an Alderman; or that, fat or lean, he should be unduly addicted to the pleasures—or vice—of the table and the bottle. "His Petty Manness" should be the prefix to the name of a Miser, or of a low swindler; while "His Brutal Cowardice" should be the indissoluble appendage to the name of him who had beaten his wife, or lifted his hand in anger

against any woman or child whatsoever. I do not think I should make an exception even in the latter case in favour of a schoolmaster; for a school-master who punishes in anger, rather than in sorrow, is a brute, for whom I have no sympathy. A rich woman who ran away from her husband in company with a footman should never be mentioned, except as Her Lewdness Iaily This, or Mrs. That; and a systematic seducer of women, one of the most odious of mankind, and worse, in my estimation, as Governor of Barataria, than a burglar or murderer, should have his title duly set forth as "His Cowardly, Selfish and Unnaturally Villany"—John, James, Lothario, or whatever else the wretched creature's name might be.

If there were any particularly great snob in my dominions—some offensive toady and tub-thumper—who stuck to the skirts of wealthy or celebrated people, and paraded to their riches or their weaknesses—a man with much impudence, little brains, and no manners, and he lived, let me suppose, in a district called Fawny Court, I would set my royal mark upon him, and send him a parchment duly engrossed and sealed, in which his title should be set forth [not a hereditary title, for his son might happen to be a gentleman], and in which and by which he should be solemnly created—"The Esyon of Fawny Court," just as if he had been a great and a good man and a true gentleman, I should have made him Marquis or Duke of Fawny Court, or some other place.

If one of my judges, holding his court in my assize town of Silverford or elsewhere, should be guilty of any want of ordinary courtesy to my sheriff or the lauded gentry of the county attending the assizes at much inconvenience to themselves, and solely because it was their public duty to do so, I should not elevate that judge to the peerage as Earl of Silverford, but should pull him down a peg or two, and create him by letters patent—"The Churl of Silverford;" aforesaid: a title that he would well deserve, and which would not gild or diminish his legal reputation, or make him a worse judge.

And coming to breaches of propriety, honour, or law, in greater passages, occurring, it might be, in the case of any of my cotemporary sovereigns—of Lilliput or Blefuscu—I might think it desirable, if either of them had broken a solemn oath, and I was at war with him, to speak of him to my Parliament as "His Sanguinary Perjury the King or Emperor of Lilliput or Blefuscu aforesaid." This of course I should only do if it were safe to speak the truth; for even in Barataria I should study my Machiavelli as well as my Puffendorf, and my Talleyrand as well as my Lockeboomaid. "Truth is not at all times to be spoken," says the worldly-wise proverb. If it were, the world would become rather too uncomfortable to most of us. I certainly should not speak it to any kings or emperors that happened to be much more powerful than myself, lest I should thereby run the risk of losing my beautiful Barataria, and my gubernatorial chair. Insincerity is a polite accomplishment, which great people are compelled to acquire as a necessary part of their education. The greater the personage, the greater must be the insincerity of his speech, if he would get successfully through the world. And in my island I would not allow my intellect to run away with my prejudice, or my abstract wisdom to interfere with my useful policy.

Thus, you see, I am fit to rule Barataria; and if ever I shall be seated on a throne in that fair land, I shall certainly try the effect of such titles of dishonour as I have cited. If policy dictate to omit the sovereigns of Europe and Asia from the operation of the scheme, no such policy will interfere with my operation upon my own dole, obedient, and intelligent people. And the project will recommend itself to their sagacity, were it only that a fair trial of it might show a saving in police and prison rates, and in the cost of maintaining the judges and the law courts. And to make the system more completely operative, I should introduce a few new titles of honour as well as of dishonour. Any worthy man and good fellow who should earn his daily bread by the sweat of his brow, whether he were hedger or ditcher, scavenger, clerk, or mechanic, who should pay his way, owe no man anything, and maintain his family by his honest exertions, should be addressed as "His Dignity John Brown or Smith," and the wife who loved him and aided him to rear his family in respectability and decency, should be "Her Dignity Mrs. Brown or Smith." My poets, who used the noble gift of their genius to the enrichment of Baratarian literature, and wrote no line that could call a blush into the cheek of youth or maturity, should be called "The Most Honourable and Most Noble the Bard." His Lordship the Earl should be taught to exchange courtesies and ideas with his Usefulness the Mechanic; and His Grace the Duke should think it no derogation from his rank to shake hands, dine, or sup with His Prudence the Farm Labourer; and Her Benevolence the Baker's Wife, who gave a loaf now and then—with a good heart and free hand, and perhaps a shilling besides—to the poor starving mother and her orphan children, that might have been refused relief by the flinty-hearted officials of the parish. *Faithful*—Enough said. These shall be the polite observances and customs of Barataria—when I get there.

GARIBALDI.

THE public is inundated with memoirs and accounts of this famous Italian General; and every day the press re-reveals his great exploits in the glorious undertaking in which he is now engaged. A review of a new book in our last number exhibited a different picture of a fugient hero, under the title of "The Modern Soldier;" and it is a pleasing offer for us to offer, by way of contrast, some original traits of this other modern soldier—if the name of model soldier were not more truly applicable to the illustrious man who is so

heavily and ably working out the future destinies of Italy. Everything we have read of Garibaldi impresses us with a perfect conviction of his patriotism and purity. The great aim and object of his life—the restoration of United Italy to rank among the nations—has been pursued with undeviating determination whenever and wherever he could have a path towards its accomplishment; and when shut out by unaccountable circumstances, from the great purpose, his career by sea and land, in distant climes, in mercantile and military adventure, has been a romance of the most marvellous incidents and the deepest interest. And his hands are clean. He has given all his private fortunes fairly and manfully earned during the intervals alluded to) to the cause of his country. Garibaldi is a poor man!

Apart from his splendid public character, there is always a natural curiosity to learn something of the every-day appearance, the commonplace habits, the domesticity, if we may so term it, and the familiar and social doings of such a man, when released for a season from "the toils of war." And though we have it on high authority that no man was ever a hero to his *raide-de-claube*, we trust our readers will agree with us in thinking, from the few particulars we are about to relate, that the heroic, in the nature of Garibaldi, is not impeached or injured by a respectful, and not intrusive, peep behind the curtain of his more retired sphere of action.

Garibaldi, in the portraits of him circulated in every direction, is represented as of gigantic stature and preeminently developed muscular strength; and most writers speak of him as pale (since the sad death of his wife), "lion-headed," and with other concomitants of the Novel-descriptive. He is rather under the middle size, and of gentlemanly demeanour, yet stately build, and capable of enduring immense exertion and fatigue. His countenance is open and florid, like that of a good-looking English peasant, and his voice most expressive and sonorous. His two sons (put in the picture-engravings as mere boys) are grown to man's and youth's estates. The elder, who has served, and is serving with his father, and been wounded, is above, and the other not far below twenty years of age. When speaking of them and their husbands in battle, their father is wont to say, "Would I had ten sons!—they should all risk their lives for the union of their country." There is one daughter, about sixteen, who, since she lost her mother, has been educated at Nice, under the care of the commander of the National Guard, Signor Deldori, and his wife, and in a manner which befits the offspring of such parents; but it would be difficult to determine whether Madame Garibaldi or her husband presents the nobler character for the admiration of after ages. Their daughter, however, with the looks of a fine country girl, is a fearless rider, and can shoot like a Volunteer! In consequence of the annexation of Nice to France, the patriot General does not like to bear the name of his native place mentioned, even in conversation; and on the celebration of men to avert that coming evil, his daughter was among the worshippers who prayed to Heaven to save them from the calamity.

In the Sicilian expedition, among the enthusiasts who hastened to range themselves under the flag of Garibaldi were a number of youths, some of them mere boys, sons of the noblest families of Milan. When any were wounded, their commander had them tended with the utmost care, and as soon as they were able for the journey, sent them to their homes. With one of the youngest he wrote a letter to his mother, which strikes us as a memorable example of style and feeling. It ran thus:—"Io vi mando il figlio. Egli è battezzato per la patria in un piti tardi in confumazione?" [I have sent your son. He is baptized for his country—later, he will be confirmed.] Is this a prophecy?

The expression sounds highly poetical—and no one will be surprised to learn that Garibaldi is of a highly poetical temperament;—and in his retirements from active life, has resided in a cosmopolitan villa, near the Lazzeretto at Nice, surrounded by pretty grounds, and the aspect toward the sea very wild and rocky; on the edge a summer-house overlooking the beeding cliff. Here he indulged in his frequent mood of wandering forth alone, and pondering on his mission—the means—the difficulties—the end. He has always been addicted to seek solitude for his thoughts, and often, when in the most desperate circumstances, it has been his practice to be his own spy,—to act out alone in the shadow of night, and reconnoitre his enemies and the condition of the country around. His partiality for the English is openly indicated; and it will be acknowledged as a proof of the poetic turn we have described, to state that we have seen an autograph letter, in which within a few days of his embarking for Sicily, he finds time thus to acknowledge the tribute of a few patriotic verses, honourable to his great exploits, and presented to him by a fair countrywoman of ours, resident at Nice.

Nizza, 23 April, '60.

Cara e Gentile Signa Dady.—Io ho letto con interesse e riconoscenza le vostre bellissime poesie. Voi dicete avere il cuore d'un angelo, per sentire con tanta generosa equità. Vorrei sì presentarsi l'occasione di potervi baciar la mano e dirvi quanto sono per voi sì animato e grato.

Vogliate comandare, il vostro devoto,

G. Garibaldi

Italian gallantry is prone to superlatives, and the free translation may be taken:—

"Dear and kind,—Moved and grateful, I have read your beautiful poems. You must have the heart of an angel, to feel with such exquisite generosity. I wish the opportunity might offer itself to enable me to kiss your hand, and tell

you how much sympathy and gratitude I feel. Pray command, your most devoted, G. G."—[Addressed, "Alta Nobil Donna Eleonora," &c., &c.]

At the villa above mentioned, female society was not wanting. The famed Lillard, and alleged Conspirator, Miss Jessie White, now Madame Mailli, was a visitor, and maintained her masculine character in full vigour; and there is also the Madame la Contessa de la Torre, who is her companion in Sicily, where we are informed they shun no danger, and, like Nightingales and Sisters of Mercy, devote themselves to attendance upon the sick and wounded, and ministering to their necessities. Assuredly the flame of patriotism pervades both sexes throughout Italy, and, perhaps, burns more fiercely in Sicily, since it has been torn away by France. For the sacrifice, the people cannot forgive their king; and foretell as the probable result of the policy now in operation, that the Island of Sardinia or (and more likely) Genoa will be demanded as a balance for any extension of the power of Piedmont in Sicily or Naples. In the new imperial fashion of paving the way to foregone conclusions, printed papers are now thrown into the *offici* and other public halls, pointing out advantages that would accrue if that slice from Italy were also annexed to the French Empire.

We grieve to have in one other matter to touch upon a painful topic; but it also displays the man, and ought not to be refused a place here. The daughter of an Italian emigrant, by the assumption of extreme love of country and heroism in the cause, attracted the regards of the patriot leader. He offered himself, and was accepted. But, alas, within a few days after their marriage, an anonymous letter apprised him that his lady had been faithless to her honour, and was unhappily in a condition which rendered denial vain. With his usual straightforwardness, the injured husband sought his intriguing partner, utterly disbelieving the infamous charge, and laid the letter before her. Confession ensued, and they parted then and for ever; but the generous Garibaldi made an ample provision for his lone betrayer.

We have, however, thrown together these private and personal traits of the most eminent individual of our time, in the hope that they may be universally acceptable. The love and attachment with which Garibaldi inspires all who come into contact with him, is shown not more by the past, than by the numbers now crowding to join him from every quarter. The poets, artists, and literati of Italy are among the foremost of his adherents. The lyric of the Sardinian national hymn, "Viva il Re," and other popular pieces, Cesare Fighiera, is one of his most devoted lieutenants; and many others of the same class, enthusiastic and patriotic, have pledged their lives and fortunes to follow him to the last. May Heaven send them on their holy crusade, and liberty and independence be their glorious reward!

TOM DUFFEY.

THE literary, like the celestial system, is marked by distinct successions of luminous nebulae. Every age has its own dusky cluster of minor stars, who, however brightly they may have flashed in the eyes of their contemporaries, are too feeble to transmit their beacons to us. We know, in a general way, as we know the stars that become massed by distance into glittering clouds, the groups of small poets, critics, dramatists, and book-sellers' backs, that shed their misty light upon particular periods. But who has any acquaintance with their lives and works? The literary antiquary, who collects more materials a hundred times over than he makes any practical use of, is the only person likely to be familiar with the nebulae of literature. To him the study is indispensable, as affording an insight into the life and history of the time. A fifth-rate author, although nobody himself, may rise into incidental importance from his relations with more distinguished men. The literary historian finds his account in hunting up the drudges and hangers-on of the stably, and in routing out the whole tribe of strayed pretenders and impudent egotists, from Ned Howard and "Quack Maure" down to Julian and Tilden. But the public know nothing of these people, nor, for the most part, is it desirable that they should go out of their way to look after them.

Nevertheless, there are a few small specialities, here and there that deserve to be separated from the rabble, and carefully housed. Tom Duffey is one of them. We, by no means, intend to imply that his writings ought to be reproduced, or that any of them would repay the expenditure of half an hour diverted from any profitable pursuit. All we desire to impress upon the reader is that Tom Duffey contributed largely to the entertainment of the British public more than a century and a half ago; that he had a vein of his own, which was flowing and run in its way; and that he ought to be known as a versatile writer, who enjoyed a wide popularity in his time. If little of him but his name has descended to us, it is because he wrote especially with a view to the current success which he achieved. Tom did not care a farthing for posterity. His works are highly coloured by fugitive characteristics, and are worth preserving, as we preserve caricatures in a museum; but it would be absurd to consult them as pictures of the age. We tried lately to read what he calls his "Comical Stories," which, we have no doubt, were considered comical by his contemporaries, but we found them insupportably dull. An author, however, may deserve to be remembered, who cannot be read.

Tom's life, so far as incidents are concerned, might be written out at length in half a dozen lines. He came of a family of Protestants and gentlemen, and one of his great-uncles was the author of the famous romance of "Astruc." He was very nearly a Frenchman by birth, and his father had no less forced to seek an asylum in this country. Tom, instead of delighting English audiences, might have been contesting the applause of the theatre with Quinault, or breaking lances with Balcan. Possibly it was this drop of French blood in him that won the heart of Charles II., and made the monarch treat the ballad-poe with such marked favour and familiarity. But the French lyric spirit, the *allegro*, and gaiety, that are

in his songs, never interfere with their genuine English character. They have the true native ring. Even *Dibdin* is not more thoroughly national than Tom D'Urfey.

This may be easily accounted for. The French element came down to him modified by circumstances; but he was born and bred, and lived all his life in English habits and associations. France was only a tradition to him. His father settled in England in 1623, married an English gentleman of Huntingdonshire some years afterwards, and Tom was not born till 1649, by which time whatever was left of French character or French prejudices in the blood of the family may be presumed to have lost nearly all its influence. Tom was intended for the Bar, and virtuously commenced his studies in one of the Inns of Court. At this point terminates the respectable portion of his biography, all the rest is Bohemian; for here follows the old story of the student seduced from his law-books by the charms of the Muses, who at that time used to flirt with their lovers in Dorset-gardens and Drury-lane, and the dark recesses of Lincoln's-inn-fields, where Davenant lodged his actresses. It is said that Tom was obliged to give up the law, because he had a stammering in his speech; but that is a mere excuse. His stammering did not prevent him from becoming one of the most capital and humorous singers of his time. He gave up the law because he fell in love with another mistress; and the first issue of his new passion was a comely produced in his twenty-second year, with such success as to decide his career for life. Charles II. is recorded to have been present on three of the first five nights. This was not to be resisted. Tom continued from that time forth to write for the stage; comedies, tragedies, operas, and even alterations of Shakespeare and Fletcher—the last-mentioned triler than we can just now bear to think of. His productions in this way are upwards of thirty in number, all of them more or less positively successful on the stage. It is an act of grace, nevertheless, to draw the dramatic world to him, who is not out of them whose title would be recognised by a reader, not to say a play-goer, of the present day. They are gone down into oblivion, by the just and irrevocable sentence of Time. But what of that? Tom is damned in excellent company. His stage rubbish is not worse than Fielding's, nor, considering the comparative age of the two, is it less deserving of pity and compassion. It is not in his rôle of dramatist that Tom is selected as the hero of this article. Had he done nothing but write plays, we should have left him in the nebulous condition in which we found him. But he wrote better things, and he excelled in them. Whoever desires to be informed what D'Urfey did well, may be well to get possession of six little volumes, published nearly one hundred and fifty years ago, called *"Wit and Mirth; or, Pills to Purge Melancholy."* The title is in the old, coarse, and figurative taste of the period, and expresses comprehensively enough the nature of the entertainment to be found within. The King's strength lay in vagrant tales, songs, and satires. These six volumes are picked specimens of his wit, and others we must not venture to say anything about the wit, who can entertain the north without a scruple.

Nor is mirth—broad, fluent, and familiar—the only quality that is conspicuous in Tom. He had considerable skill and adroitness in turning his mirth to the best account. In the society of the King, a song-writer lay in his happy choice of easy verse and popular airs. With the Restoration had come in a new style of music. The stately Elizabethan measures and the scientific madrigals and canons in which Milton had been trained up, were supplanted by romping jigs and amorous corantos. The king set the fashion in music to which he conformed best. He had always displayed a great passion for fiddles, because the instrument was especially suited to punctuate lively and rapid airs; and when he was in exile, and could ill afford such luxuries, we find him begging of his friends to send him musicians who could play dances on the fiddle. As soon as he became king he set up a royal band of "four and twenty fiddlers all in a row," who used to play tramping lachas and sarabands to him while he was at dinner. Fiddles and fiddle music became the rage. Every comely ended with "fiddles and a dance," and the contagion, so easily caught, spread through all classes of society. It was to this taste Tom administered in his songs. He wrote up, or down, if you will, to the fiddle music. Many of his lyrics are so rattling and scolding as that mad dance which the king was never tired calling for, "*Carckle, away!*" He seized upon the most favourite ballad tunes, adapted words to them, and through their popularity secured his own. He went farther, and sometimes borrowed their barbers, so that he made doubly sure of a welcome. It was an old friend with a new face, and generally with a more cheerful one than before.

In addition to this art of writing popular songs, Tom possessed the fortunate talent of being able to sing them popularly. A song of Tom D'Urfey's, sung by Tom D'Urfey himself, was one of the choicest delights of the social circle. Wherever he went he was received with open arms; he was a frequent guest at the tables of the nobility, and he was intimate terms with the Duke of Dorset at Knowle; and with Warton and Albemarle, the son of Monk, had the honour of being reckoned among his close friends. The King took as much pleasure in Tom's singing as in the prandial performances of his fiddlers; and not only could he sing at the palace, but would sing with him on the opposite side of the paper table—a memorable fact, which has been recorded in Tom's memoirs with due ceremonial effect. Tom himself may be presumed to have looked back upon this great event in his career with rather less awe than his biographers; for he afterwards became so much accustomed to royal musicians, that it could hardly have appeared to him as very wonderful a thing that a king if he could sing at all, should sing off the same sheet of music with the poet. Tom, indeed, sung before all the crowned heads of his time, and they happened to be numerous, without incurring Cornwall, under whose government Tom was born. The list embraces Charles II., James II., William, Mary, Anne, and George I. To balance the obsequious side of the paper table, and to lean on Tom's shoulder, we have the more substantial friendship of Queen Anne, who gave him fifty guineas for singing a song he had written against the Princess Sophia.

But great a favourite to Tom was at court, he was a still greater favourite in the country. He was better liked in the great manor than in the foremost streets of the age. He kept the tables of the squire in a roar by the excellent new songs to old tunes which he industriously furnished them. Every one of them knew the tunes, and could, therefore, hum the words at sight,—a facility in the way of enjoyment for which they held Tom in the

highest esteem. Even Pope, who had no more ear for music than a knife-board, condescended to learn one of Tom's songs "without book," and bears testimony to the extraordinary popularity in which D'Urfey's compositions were held. "Any man of any quality," he says, in one of his delightful letters, "is heartily welcome to the best toping-table of our gentry who can roar out some rhapsodies of his works." He might have added that a still louder welcome was given to the man who could boast of having heard Tom sing one of his own songs. To such a person was accorded the most riotous honours of convivial hospitalities. The musical pilgrim, who brought home a relic from the favourite shrine, could hardly have excited more enthusiasm.

It may be generally taken for granted that a wide reputation is never obtained without some grounds. Even Tupper and Barnum can plead a justification of their notoriety. And Tom's popularity, which was quite genuine, may be traced to perfectly solid and respectable sources. He adapted his powers with remarkable tact to the prevailing taste; and his success was chiefly drawn from his idiomatic diction and the balubricity of his measures. His songs were the easiest songs in the world. They sang themselves. They ran on in the most natural and unaffected way. They had a heartiness in their soul of jocundness, and an obnoxiousness that delighted all manner of people. They were wonderfully simple, and, so to speak, prosaic and commonplace, which were amongst their greatest merits. They were so direct and fluent, and so apt and to the purpose, that you could almost tell what was coming, and you seemed, therefore, for the moment, to partake in the triumph of the author. And there never was anything so good, so genial, so irresistible, as their burthen and choruses. O'Keefe is the only song-writer who approaches Tom in the variety and curious felicity of his burthen; but O'Keefe gives way to a spirit of burlesque, which, exquisitely comical as it is, makes an essential difference between him and Tom, whose tags and choruses are always exactly what they want, and what you expect them to be, and so singularly fitted to their places, that nothing else could be substituted for them. They set you dancing, and singing, and laughing, and thumping the tables, whether you will or not,—the very ends for which they were intended. They bring out all your sunshine, make your wine or your rum-and-toddy put you out—if you will put yourself in a centre for the sake of a night with Tom,—glow and gallop more fiercely; and in spite of yourself and your private glooms and dogged temper, they make you a good fellow, full of honest sentiments and genuine impulses, animated by hilarious loyalty, ready to lend anybody any amount of money, or to undertake the most quixotic enterprises in the way of balling enemies, or defending your country—as long as the night lasts.

Here is a verse from the song of "*The Bony Milkmaid*," which will serve, as far as a single specimen may, to show how pleasantly Tom, who lived all his life in the disquisition of the town, could write about rural things. In this song he has the two characters he took to himself, and he has taken his lines from an older song, which we cannot help thinking be considerably improved. This verse brings the milkmaid before us in a winter scene:—

"When cold milk mists do rise,
And Bowers can spring no more,
The fields that were once
So pleasant and so free
By winter all ended are;
Oh! how the larks have
Larks, with their white face,
And larks do dandily play;
But it is not so
With those that go
Through frost and snow,
With chorles that glow
To carry the milkmaid's pail."

The merit of the refrain does not belong to D'Urfey; but it will be felt in humming over these lines—for it is hardly fair to submit them to the process of reading—that he makes it tell with effect. Very striking, too, is his "*Vive le Roi!*" the old God save the King chant, which he brings out with elastic energy; and, better still, must have been his song upon the Princess Sophia, as we may judge of it from the only stanza that has been preserved. The Princess then Electress and Duchess Dowager of Hanover, was next heir to the crown, and the scandal upon her in these damaging lines was written to please Queen Anne:—

"The crown's her too weighty
For shoulders of such light;
She could not sustain such a trophy;
Her crown was too heavy;
The crown was too heavy;
No Providence kept her
Away,—your old daughter's light."

Tom, perhaps, was not strictly a poet, in a rigorous sense. He will never find his way into anthologies or annotated editions. But he was a writer of high mark in his way. He knew how to carry his audience with him. He wrote for a result, and obtained it. There are no fine images in his songs; no foreign decorations; no time; everything is plain and to the purpose. He made songs out of the stuff that makes songs live out their time; and his lasted far more than the average duration of the life of popular songs. If his songs are forgotten now, so are nearly all the songs of the sixteenth, seventeenth, and eighteenth centuries. A few of Shakespeare's and Ben Jonson's, something here and there out of Fletcher, a stray couplet from Herrick, a match of immortal music coming down from Comus, so from the sphere, and hardly half a dozen more, still linger in the general ear. No great discredit to Tom that he should be forgotten with the rest.

He was by no means particular about his rhymes. The melody of the rhythm was enough for Tom. He knew that so long as his measures bounded freely along, and he succeeded in touching some natural chord of mirth or sympathy, his hearers would not be much inclined to criticize his structure too closely. It is a defect, of course, a defect in any but Tom wrote to be sung, not to be read. Such blind rhymes sometimes occur as "*trick*," "*joys*," "*blown*," "*adorn*," "*cease*," "*deities*;" yet we dare say that not one of the country squires, whose raptures are described by Pope, ever found them out. Tom lived in an age of literary dexterity, but does not appear to have quarrelled with anybody. He was not in the great manor to have committed the most opposite people. Everybody was goodhearted to him. Steele speaks of him in the *Tatler* and the *Guardian* as the "celebrated Mr. D'Urfey," and pronounces a paucity upon his character; Pope wrote a prophetic ode for one of his plays, and let him off with a bare allusion in the "*Dunciad*;" and the

fortitious Addison interested himself to procure a benefit for him at the theatre, when Tom had fallen into old age and neglect. "He has made the world merry," wrote Addison, "and I hope they will make him any as long as he stays amongst us. This I will take upon me to say, they cannot do a kindness to a more diverting companion, or a more cheerful, honest, or good-natured man."

There is a portrait of Tom at Knowle—a hasty sketch,—representing him with two volumes under his arm. Few personal traits, from which we might gather a full-length portrait of the man, have been preserved. He was so universally known that nobody seems to have thought it necessary to note any special particulars about him. We do know, however, that Tom lived and died a bachelor; that he used constantly, in the latter part of his life, to walk about the city of London and the purlieus of Westminster with a page behind him; and that his person was, consequently, already so familiar to the people, that when he was about to appear in public on the occasion of his benefit, Steele was afraid not to "draw" an enormous crowd.

Tom lived to the good old age of 74. His death is recorded on a stone in the church of St. James's, Piccadilly, bearing the following simple inscription:—"Tom D'Urfey: Dyed Feb'y 3rd 1723."

RURAL ECONOMICS. TENANT FARMERS NOT RETAINERS.

It is impossible to comprehend the actual relations between landlords and tenant farmers in England, without having regard to the history of English tenures. The exigencies of a semi-barbarous race of military conquerors led to the establishment of the feudal law by the Normans, from which this country has never been completely emancipated, and, least of all, those classes whose livelihood has been obtained by cultivating the soil. The feudal law is everywhere one of force and barbarism. It involves the supremacy of the military class, the expropriation of the peaceful, the concentration of the land in the hands of the nobles, and the subordination of all industry to the maintenance of an aristocracy. Thus our Norman conquerors, having "acquired," or seized, all the land of England, reduced the previous owners and the actual cultivators of the soil to the condition either of serfs or villans, or to that of tenants bound to do homage to their lords or landlords, to render them certain rents and services, to follow them to the wars and the field,—and the whole system was one of grades of ennoblement. The great lords—often the owners of manors by the sword—held of the Crown, and they granted lands to their retainers, who again made sub-tenants to tenants, who may be considered the owners, though they were not, perhaps, the cultivators of the land. In all these gradations, or sub-gradations, homage and services, more or less consisting of, or implying personal obedience on the part of the tenant to the landlord, as well as rent, sometimes in kind, sometimes in money, were rendered as conditions essential to holding the land. Gradually, as the nation advanced in wealth and civilisation, and warfare became less the everyday business of the aristocracy, these services for money payments, until, at the Restoration of Charles II, feudal or military tenures were finally abolished. But the sentiment of homage had been deeply graven on the minds of all who held land as subordinate tenants, while the possession of superiorities over large territories and tracts of land formed at once the sign and the substance of the nobility. The great lords, therefore, always formed substantially the ruling power, and they framed their laws mainly in the spirit of their feudal ancestors. No doubt there were, down to the middle of the last century, vast numbers of sturdy yeomen—men who tilled their own hanks, and who, with the inhabitants of the towns, enabled the Parliament to resist and put down the encroachments of Charles I.

But with the great increase of manufacturing and commercial industry which commenced about 1700, and constantly grew stronger and stronger, the yeoman proprietors found themselves unable to compete with men who hired farms, generally in larger tracts, and gradually sold their lands either to neighbouring proprietors or to persons who, having acquired money by trade or commerce, were desirous of forming an estate and founding a family which, sooner or later, should share in the privileges and influence of the landed aristocracy. Our heritage is confessedly founded on the assumption of large possessions in land on the part of each peer; but any one who will take the trouble to search that barren hereditary, "The Peerage," will find how large a proportion of that body originated in the last half of the last century. To the commencement of the present century, farmers (i.e., renting farmers), as a class, were in somewhat fairly condition, which offered no striking contrast to notions of obedience to their landlords, which had descended as a feudal inheritance from the agricultural mind. But rents had long before that time begun to rise. Arthur Young, alluding to the value of landed property in 1770, says:—

"A neighbour of mine in Suffolk, who inherited a considerable landed property, informed me that in various conversations he had between 1770 and 1780 with a relation far advanced in years, much surprise was expressed at the rise of rents which then began to take place. Through the long period of his relation's experience no rise was ever thought of; and hence after him, in long succession, was signed without a word passing on the question of rent; that was an object considered fixed; and grandfather, father, and son succeeded without a thought of any rise."

But farming was then and later carried on without much capital. In 1765, Burke, in his celebrated letter, "Thoughts and Details on Scarcity," says:—

"The farmer's capital (excepted in a very few persons and a very few lands) is far more feeble than is commonly imagined. The trade is a very poor trade, and subject to great risks and losses. The capital, such as it is, is turned but once in the year; in some branches it requires three years before the money is paid. . . . It is very rarely that the most prosperous farmer, during the whole of his quick and dead stock, the interest of the money he turns together, with his own wages as overseer, ever does make 12 or 15 per cent. by the year of his capital. I speak of the prosperous. In most parts of England I have rarely known a farmer who, to the end of his life, has not been a debtor to his landlord or to the public, that is, after a course of most unremitting parsimony in labour (such for the most part is theirs), and persevering in his business for a long course of years, died worth more than paid his debts, leaving his posterity to continue in nearly the same wretched condition of debt and want, in which his last predecessor, and a long line of predecessors before him, lived and died."

That is the description of a mere peasant, such as, for the most part, until a recent period, were the cultivators of land throughout Europe.

With the commencement of the present century, English agriculture assumed a new phase. Trade and manufactures rapidly increased the nation's wealth; the prices of all kinds of agricultural produce became, from a combination of causes, unusually high, and many persons of enterprise entered into farming as a genuine means of gain, and not as a necessary misfortune. Even ordinary farmers who happened to have recently renewed their leases got rich, as it were, in spite of themselves, from the mere advance of prices. Of these many enlarged their business, and became the founders of the class of large farmers who now form so important a portion of the agricultural population. Rents then began to rise, and, in 1800, it appeared, for most of the farmers who had renewed their leases about and subsequently to 1810, found, when a period of lower prices arrived, in 1820 and succeeding years, that they were unable to pay the stipulated rents and carry on their business. At this time leases fell into some desperate with both landlords and tenants. With landlords, however, who the tenant's means did not enable him to farm as well as he had done during the high prices, the lease did not present demands for abatement of rent which could not, with prudence, be disregarded. It was better to make a temporary return of fifteen, twenty, or thirty per cent. of the rent than to run the tenant and let the farm thrown upon the landlord's hands in the time of "agricultural distress." Tenants who had agreed to pay high rents, in expectation of receiving high prices for their produce, were wholly unable, by the system of husbandry they had hitherto practised, to pay those rents, and consequently they felt shackled and bound by permanent contracts, made under widely different circumstances. They were unable to alter their leases, where such surrenders would be accepted by their landlords, or declined to renew them, and carried on then, as they were provisionally, as tenants from year to year. So all new tenants preferred to take, and landlords preferred to let their farms on yearly biddings. During all this time various corn laws were passed, for the purpose of excluding prices artificially, by excluding, wholly or partially, foreign corn from the market. The Legislature, in both Houses, appointed numerous committees to inquire into "agricultural distress," and to devise means for relieving it—at the expense of the rest of the community. All the while tenant farmers were under engagements to pay rents calculated on prices which they actually obtained, and, in the time of "agricultural distress," would keep what is called, per quarter, but did not prevent it falling to 40s. Then 70s. and afterwards 80s. per quarter were supposed to be secured to English farmers by legislative enactments; but still prices refused to rise to the law-defined points. Landlords and their agents, however, assumed that prices could be regulated by law, and set the farmer's rents accordingly, so that from half-year to half-year tenants sold for, and the majority of landlords granted temporary abatements or drawbacks from the rent, as matters of grace and favour. Of course tenant farmers, under such circumstances, could neither feel nor act independently. The traditional sentiments of feudal homage occurred with the temporary concessions of the landlord, and the husbandman was thereby rendered dependent on the will of his landlords. Without leases they could not help themselves, should the landlord wish to impose on them terms inconsistent with a commercial contract, which engagements for the occupation of farms had in fact become. Still many farmers felt, or affected to feel, while in the hands of the great proprietors sought to cherish the sentiment expressed in the lines,—

"The farm that I hold on your honour's estate
Is the same which my forefathers held;"—

While the active and more enterprising classed at the helpless state of bondage under which they carried on their business. In the last agricultural distress was experienced, and the exercise taken upon the chairmanship of the late Speaker. Then Mr. Shaw Lefevre completely exposed and exploded the whole system of Protection. Farming was shown to be a trade governed by the same economical laws as other trades, and consequently, that freedom and security, combined with capital and enterprise, were the essential and only conditions of success in husbandry.

From that time to the repeal of the corn laws, in 1846, farmers gradually and slowly, and landlords reluctantly, recognised this truth; and even now landowners struggle vehemently to maintain their tenants in a state of semi-feudal dependence. Farmers, on the other hand, are now more or less aware of their position, and are anxious to obtain capital and secure the tenure of their farms, so that they may reap fair returns for their labour and enterprise, and their emark in the work of cultivation. Such is the present position of English agriculture: such are the existing relations of landlord and tenant farmer in England. Curious are the manifestations of the workings and counter-workings of the opposite principles of feudalism, or landlordism, and commercial husbandry, which are daily tested in the minds of the cultivators of agricultural improvement which proceed from both parties, while neither quite recognises the conditions required or deemed essential by the other.

STREET RAILWAYS.

In the infancy of railroads, when the "turnway" was used only for conveying coals, iron ore, or granite, from the mine and quarry, to the place of shipment, the immense loads were drawn by horse-power. From this stage we passed, almost at a bound, to the age of Stephenson and the locomotive. The steam-engine on wheels gave us at once the maximum of power; the "iron way" removed the obstacle of friction; the minimum, Stephenson regarded the locomotive and the rail as "husband and wife," and asserted that they never ought to be separated. Certainly the alliance was a fortunate one, and has produced immense results. Admitting all the advantages of the union, social and commercial, a doubt may yet be permitted, whether the grandeur of the effects that followed the combination, did not draw into undervalued oblivion the capabilities of the iron way, in its first stage of development. At one time it was believed that the horse would soon be extinct; and Hood expressed the general feeling of the "road," in the whimsical sonnet, in which a disgusted driver invokes all kinds of disasters on the fiery steed of the "rail," hoping that the iron spirit of the stable would survive in the station, and that the oxen of the future—

“*Thy might pierce their coats, and give them humble animals a food of slaves.*”

But the “sober six and seven-milers” are not extinct; nor the generation of drivers and ostlers, and all that belongs to the stable generally. The main lines of traffic have passed from them, indeed; but the horse is still the motive power on the whole road—the Macadamized tributaries of the great iron ways that intersect the land. And these are only great because they are fed by the small; we cannot entirely dispense with hoof and shaft, fly, cart, and waggon. If we had a fleet of *Great Easterns*, we must still have coasters and river-boats; and the “triumph of engineering science” should mean to forget the fact. But in working out our railway system to its present stage, we did not, or overlook, or neglect the advantages of the old mode of traction on the new ways; we covered the country with the metal rail, and put the steam locomotive on every line, forgetting that the horse on the rail might do service for the steam-engine is unfit. The first grand success of a passenger by the new system was the locomotive, and it became the settled notion that passengers could be drawn by nothing else. It was a striking illustration of that *and of our neighbours* that says the best of anything is often the enemy of what is good in it. The superlative degree kills the comparative. We took it for granted that the highest development of the new system was the only and the practical form of it; and by going in all cases to the extreme, we left one important link in the whole chain of our communications wanting. We have been severely punished for falling into a rut, both of thought and action, in this matter; we have long seen and felt that the great railway system was deficient in adaptability to the necessities of our time, and it has been reserved to an American—the child and champion of progress by right of birth—to give us a push forward, by leaving originality and courage enough to go back.

Our new system is completed, by reverting to first principles; and we are creating an account of gratitude to America and Mr. G. F. Train, for the simple revival of a thing forgotten; he has “rehabilitated” the horse, and restored the animal to the rail; thus making the iron line at last available in our over-crowded streets. The quadruped was taken off the tramway some thirty years ago; when he was released from the train of coachmen in the North, we loathe to say farewell. It was a cruel and unnecessary act of our time, and it has been rejected to meet him again in harness, and on the line, at Birkenhead, on the 30th of August, with a new and capacious omnibus behind him, filled with delighted passengers, and glorious with plate-glass, cushions, and painting. A novel sensation is preparing for the British public, to whom the “street-car” is unknown; and it is evident enjoyed as such by the first Birkenhead passengers. “Nothing so new,” somebody says, “as that which has been forgotten,” and a restorer often deserves as much credit as an inventor. So we wish all success to Mr. Train, at Birkenhead and elsewhere.

The return to horse-power, if properly applied, will complete our railway system, which, though a wonderful step up to a certain point, is, at that point is reached, the cause of great and increasing inconvenience. All our great lines terminate in the suburbs, or at a considerable distance from the centre of the metropolis; and the goods and passenger traffic between the stations passes through streets too narrow even for the ordinary business of life. From north to south, and from east to west, the roads are crowded with thousands of slow heavy goods, that a horse tramway round the city would divert from our thoroughfares—if streets one cannot pass through still desire that name.

The street railway, by a little arrangement, might be made to serve the double purpose of carrying passengers to the points of departure, and the suburbs to the centre, or near the centre of the City, and connecting the different railway stations. But its first application will probably be to the conveyance of passengers; and we trust that the solid obduracy of the great omnibus companies, that have resisted all suggestions of improvement in the construction of their vehicles, will not resist its discovery.

The “street cars” once at work on any road out of London, will extinguish the old bus on that line. And the disappearance of only half those narrow boxes on wheels, with their waste of power, equine and human, will be an inconceivable relief to the City. All other vehicles can pass over, or even upon, the new street-lines without the least difficulty. It is the great advantage of the street-rail that it does not monopolize the highway; it leaves it open to all; the railway proper excludes everything but the engine and the train; and this we have always thought one of its drawbacks. By the time the “street-cars” have been running six months, we shall wonder how so obvious an improvement had not been adopted long before. We presume they will be a great source of comfort to the masses of the poor passengers they will be heeded to carry, as the present omnibuses; we shall thus escape the abuse of overcrowding, to which the cars, like all public vehicles, are liable in New York. The importation from America must not be regarded as bad practice with it. The free-and-easy system of our coaches, that permits everybody to destroy the comfort of everybody else, and pack every car and bus to suffocation, against which nobody ventures to protest, would be an intolerable nuisance in London. We hope Mr. Train will reconsider his preparations for “standing” passengers inside, and abolish those straps from the roof, for the “standards” to hold on by. We know, by experience, how it works in America. The wheels of the cars will be a great relief to the Birkenhead cars with apprehension, and make an early protest against them.

In all else this class of conveyance is admirable. It is easier to get in and out, especially for ladies; the smooth, gliding motion is luxury compared with the jolting of our present passengers, and two horses will do the work of six, and do it better and more easily. We have taken kindly to many American “notions”—washing-machines, india-rubber shoes, apple-peelers, and sherry coolers, pleasant importations, all of them, in their way, but the “greatest” is behind in the city railways and the street cars. Mr. Train must not stay too long in the provinces. Here is a greater field for him than in many Birkenheads. The wheels of the London cars will be a great relief to the Birkenhead cars with apprehension, and make an early protest against them. We are all ripe for the promised American revolution, and look impatiently for the time when we can read a Declaration of Independence of our many obstructions. We understand that Mr. Train has received a concession of some width of roadway, to begin with, from the Metropolitan Board of Works; and it is one deed, that shall be scored to the credit of that laudable body, and for which immeasurable Bunsen and Bunsen shall be forgiven them.

PREMATURE DECAY OF OUR PUBLIC BUILDINGS.

There is something very startling in the fact that most of the stone used for building purposes in London, within the last forty or fifty years, shows marked symptoms of premature decay. This is not the case of the only unfavourable exposures, nor has the decay of old buildings been much accelerated. Modern stones of all kinds seem to lose their angles and edges with unaccountable rapidity, and we find the vast pile of the Houses of Parliament, almost unscathed, almost as fresh as the day of its consecration, and the Queen's Palace, in St. James's-park, actually falling to pieces, and requiring to be continually painted, to prevent the sentinels keeping guard around it from being knocked on the head by the crumbling mass above.

There are two well-marked causes of this decay. One is a want of knowledge and care in selecting good stone adapted to the required purpose. What between the quarry-crowd, the clerk of the works, and the architect, and the supposed necessity of reducing the contract for material to the lowest figure, the cheapest stone is taken. As little as possible is spent on the stone, in order that there may be the more left for decoration. This is one of the *demons of our day*. Buildings are planned and erected which ought to last for centuries. They must be constructed with economy; and what is economy in building? Is it indifference to the foundation, and lavish outlay on all that comes before the eye? Is it to neglect the essential, in order to elaborate the incidental? May not a building be beautiful in its fitness, even without decoration? and can anything be more ungrateful than the substitution of the most inferior materials, and the neglect of the most important of those queries to our architects, with the suggestion that a minute knowledge of materials of construction, and of the chemical and geological, as well as mechanical conditions, under which they are to be exposed, ought to be a subject of study and education amongst them to a far greater extent than it has hitherto been.

There is another cause of decay also requiring consideration. The atmosphere of large towns, and especially of London, is loaded with various gases, which, added by the dampness of our climate and its variable temperature, seriously affect most building-stones. The daily exhalation of many thousands of tons of coal, more or less impure, and the animal and vegetable effluvia connected with the daily pressure, and food of millions of millions of human beings, cannot but produce a great effect on absorbent substances, and tend in many ways to decompose and disintegrate all those stones of which carbonate of lime forms an essential part; and this is the case with almost all the freestones in use.

Now, we have no choice but to build with the materials obtainable at a moderate cost; and if we will take stone, we must have absorbent stone. It behoves us then to set our chemists to work, to enable us to do this with some reasonable prospect of durability, and discover a method of preventing and stopping this terrible decay.

Every one who has ever seen a wall long exposed without numerous claimants for the honour and profit of discovery in relation to it. For twenty years or more protection has been asked for many ingenious inventions for preserving stone, none of which stand the test of time and exposure. One large class of inventors endeavoured, and always in vain, to discover some paint that should be as durable as oil, and as impervious to the weather. It is possible that some one is likely to be discovered. Another set of discoverers, better acquainted with chemistry, have tried to obtain a mineral preparation capable of application in a dissolved state, but rapidly re-assuming its stony condition, and choking the pores of the stone with an indurated material.

Not long ago much attention was excited in regard to this method, owing partly to its novelty and ingenuity, and partly to the fact that the method, which it was introduced. At the suggestion of Prince Albert, part of the river-front of the Houses of Parliament was treated according to this method. Flint, hard and indurated beyond most substances, may be dissolved in water by exposure to caustic alkali under high steam-pressure. A kind of soluble glass, in fact, is thus made, and, as the alkali is readily parted with, it was thought that this liquid, or water-glass, being thrown on the stone, a coating of flint would be the result. It failed, owing to the want of a sufficient exposure to dry air. The rain and damp prevented the requisite deposition and adhesion.

An ingenious Hungarian (Mr. Serdency) practised a modification of this method, under the patronage of the late Sir Charles Barry, and applied it to the whole of the Speaker's Court of the great Westminster Palace. For a time the method was kept secret, but it has lately been commented on by Dr. Faraday. To obtain dryness, the stone, after being treated with the soluble glass, was covered with a thin coat of paint, which water from the air did not penetrate. In time this would decay, but it was thought the stone would then be coated with flint. Unluckily, it does not seem certain that the kind of flint forming the coating is itself unscathed by exposure, or sticks tightly enough to the particles of stone to prevent decay. The case, that the stone being generally wet when the alkali is first applied, there is never sufficient dryness. It is by no means clear that this method would succeed for more than a very limited period, even if once successfully completed, and that is almost an impossibility in our damp climate.

A yet more ingenious application of chemical principles has been made by Mr. Frederick Ransome, of Ipswich, already well known for his artificial stone, made of the soluble glass above alluded to. Taking advantage of the slight affinity of the alkali and flint in water-glass, he applies to the stone, after being washed by this solution, another simple preparation, the result of which is to throw down very rapidly that peculiar mineral which is necessary to adhere to brick and give it strength, to the concrete so much used in modern building. This mineral is known to adhere with extraordinary pertinacity to foreign bodies with which it comes in contact. The method was applied some four years ago to portions of stone on the river-front of the Houses of Parliament, then very much decayed; and the stones were expected to adhere to brick, and give it strength, as when they were first exposed. It has been more recently applied to many ancient buildings, and to the stone facings and ornamental parts of others. Time alone can decide whether its success is as complete as theory would suggest; but, up to the present date, we believe, there is no weak point shown.

If this last method be known that a method as important is likely to be fairly tried on a large scale. During the life of Sir C. Barry there was a tendency to give his *petit* more than a fair share of protection; but the authorities

at the Board of Works are, we believe, now taking measures to secure a thorough and searching investigation into the whole subject. It is difficult to overrate the importance, as there can be little doubt that within a few scores of years the whole of the elaborate decoration of the palace at Westminster, to say nothing of other public buildings, will be altogether obliterated, unless some preservative process is found to succeed. It is also a matter as interesting in reference to future buildings as to those already erected.

A BUSINESS QUESTION.

THE eminently practical men of the City, who pride themselves on being "business-like" in all their ways and methods, frequently do things that appear the very reverse of practical, to those who, we presume, would consider the end of the "business" circle altogether. Take a case—by no means the first of its kind,—the police reports of Tuesday last, as an illustration. An errand-boy, in the service of a firm "in a large way of business in Gresham-street and Manchester," has dangled and upset that said large business, for months past, by suppressing the hour and foreign letters of the establishment given him to post, that he might apply the few shillings of postage to his own use. For no less than eight months the errand-boy had deflected, interrupted, and confounded the transactions of this firm in a large way of business, giving the heads of the house "great inconvenience," and subjecting them to "an imputation of bad faith." Bills of lading and estimates of the cost of machinery left the office, but never reached their destination. Seventy-four letters were found at the boy's lodgings, and nine more in his pockets, from which he had removed the postage-stamps; eighty-three letters of a firm in a large way of business suppressed for the sake of a few shillings, by the errand-boy, in "great contempt" to those who, we presume, would consider the end of the "business" circle altogether. And for any loss or damage the masters may incur they ought to bear a full proportion of the blame. In reading this class of police cases, we have often been puzzled to account for the very singular theory, certainly the very singular practice, that appears to prevail in the very exact commercial world, by which such documents, on which the credit, profit, and existence of a house depends, in the last stage, that of transmission, are trusted to errand-boys. The correspondence has tasked the faculties of the merchant, has occupied all the clerks, has involved intricate calculations, and may affect amounts only reckoned in thousands of pounds; and after all this labour, it is given over to the custody of the lowest and least responsible agent of the establishment,—the errand-boy, who may defeat a whole speculation, by applying the postage to the purchase of sweetmeats! Can any business man tell us why this is so often done?—why posting the letters of a firm is not thought quite so important a duty as writing or copying them? Is completing the last link in the chain of business to the little consequence that it is ranked with lighting the fire or sweeping the office? Is only writing a letter considered a clerical duty, and is every subsequent step in the process merely menial? Is carrying these packets to the Post Office held to be beneath the dignity of a clerk? Or, our uneasiness would not cannot explain this mysterious inconsistency of men who would hotly resent the charge of being unbusiness-like. It appears to us that the credit of hundreds of firms is often dependent on the punctuality and probity of boys to whom handbills and notices are still a temptation, and to whom the most important letters may appear as a mere card of post, for which a fee, which a clerk or a scribe may get, by taking off the stamp and dropping the packet down the nearest sewer gully. If firms "in a large way of business" would only reflect that the last stage of their many transactions is really the most important of all, they would, perhaps, not put their funds and credit into the keeping of *gringos*, in whom a rational sense of duty is not much more developed than in monkeys. If we were in a large way of business in Gresham-street and Manchester line, we should post our letters with our own hands, that we might feel certain on this vital point, or insist on our chief clerk, or the cashier, or our junior partner doing it; we certainly would not give the errand-boy the terrible power of bringing ruin on the house, by turning the foreign postage into pocket-money, and thereby having a "spee."

A NEW AND GROWING NUISANCE.

ENCLOSURES are very properly pruned in their parks. There is nothing like them in beauty, sanctity, and extent in any other English cities. They are the "lungs" of London, the recreation-grounds of millions, the one great national ornament of the largest and highest metropolis in the world. Under certain regulations, so slight as to be almost imperceptible, they are open to all. No book is kept at any of the gates to receive signatures, no order has to be countersigned by any authority, and the public domain is only to be observed, and the rights of property respected. They are public estates governed by elected trustees, and maintained, for certain purposes, out of the taxes. What those purposes are, is sufficiently plain upon the surface. Parks are not pleasure-grounds, balls, and pulpits, unless the majority will it, and the majority evidently does not will it. In some cases, these places have been turned into promenade concert-grounds, it is presumed by the desire of the majority. If this is not so, harmless as the Sunday music may be, it should be put down. The essence of good-citizenship is to rule by majority, and to respect minorities. What some may think an agreeable amusement, others may consider a criminal nuisance, and, unless a fair balance of heads and hands is made out in favour of the miscellaneous Sunday park concert, they should be returned to swell the attractions of tea-gardens and music-halls.

The Sunday bands have done their worst in the happy ordeal of discussion and opposition, have brought their way of it before fairly,—and have taken moderate root as an "institution." We have no right, so it seems, to call them a nuisance, though they encourage other encroachments. If they have not brought into existence, they have certainly swollen the dimensions of an unmitigated and growing nuisance. Go into any park, from Kensington to Strepney, on a Sunday afternoon, from five to eight, look on in summer, and you will find at least a dozen raving societies standing upon chairs, each one endeavouring to impress a listening crowd with a sense of his critical excellence. Formerly these outrageous missionaries—what few there were—had some appearance of age, if not of wisdom; but now that their numbers are multiplied a hundredfold, they seem to consist chiefly of

young men with military beards, and boys with sharp voices, blinking eyes, and offensive airs of superior goodness. The gospel they preach is not remarkable for inspiring them with modesty. They alone lay claim to the possession of the right doctrine. The whole "Humane" is full of "heresies"; the world is full of sinners; the bad "arrest" is only one result of turning a deaf "hear" to such infallible teachers; "Igh Eaven" has chosen them as its special prophets; refuse to pay a penny when the hat goes round, and "Eil!" will be going for you. Youths of ten or twelve years of age are encouraged by a hundred weak-minded listeners to hold forth in this style, while their proprietors may be engaged in picking the pockets of the crowd—in some cases the only object of the whole business.

In other cases the strings of the inspired boy-puppet may be pulled by fathers, mothers, and elder brothers, and field-preaching is substituted for quite as profitable an out-door game as walking on stilts, dancing on the black-wire, or ground and lofty tumbling. In some few cases, a dissipated boy with a loose tongue may have been caught by a knot of bad-gossellers, and played as a trumpet card against the unity of Jesus haddis. In all cases this park-preaching is offensive, unseasonable, and a living caricature upon real religion and piety. It is an unqualified intrusion upon the recreation of millions. It drives thousands of watering sheep, from a spirit of opposition, out of the fold. The police look at it, walk round it, and in the absence of instructions, seem afraid to touch it. These instructions to "move" it "on" might at once be issued. The supposed end ought not any longer to be justified by the means.

If a dozen men were found touting helplessness in the Regent's-park on a Sunday afternoon, they would not be saved from the watch-bench by stating that they were gunning for Bibles. If a party of unbusiness-like propagandists, on the same day, were to erect "cockades" in Hyde-park, that presumed sinners might have a chance of winning a choice hymn-book for "three sticks a penny," the officers on duty would know how to deal with such a peculiar manifestation of piety. Why, then, this delicacy about dispersing an obstructive prayer-meeting? There is nothing in loud and frequent prayer which commands respect, or betokens a superior degree of Christianity. We are not aware that old Howell, who prayed when washing his hands, and after putting on a clean shirt, was a saint, compared with his companions in the time of Charles II. There is no such "spiritual distinction" in this mad metropolis, to make this kind of preaching a religious necessity; and even if there were, the parks are not the proper meeting-places. Until the public invites the trespassers to these places, they ought to be handed to the gaol.

INEDITED LETTERS OF LORD NELSON.

(Continued from p. 207.)

In a few days they went again to sea, and, after a bad cruise, put into Leghorn on the 24th February, where they remained till the 6th March, when, the Admiral having got intelligence that the French fleet was seen off the Isle of Majorca, orders were sent to sail to sea immediately. The ships were taken unawares; but all were got off in tolerable order. On the 10th, they got in sight of the French fleet, and a signal was hoisted for a general chase. They had little wind, and the enemy, unfortunately, were in-shore of them. Two days afterwards they were close upon the French ships, and Nelson wrote a brief exulting note to Vice-Admiral Gosselin, to whose division he belonged, to congratulate him on being so near the enemy, and to beg a few additional men, should opportunity serve. Three days afterwards he writes again, to say "The enemy are fled." The *Agamemnon* and *Invincible* had engaged the *Cu Ira* (described by Nelson as being large enough to take *Agamemnon* in her hold) and the *Crower*, who defended themselves gallantly, and suffered severe losses—nearly 400 men being killed in each, out of a crew of 1,200 in the former, and 1,000 in the latter. On the next day both these gigantic ships surrendered to Nelson. The rest of the French fleet behaved extremely ill, and finally fled to the island of Minorca, where they disembarked, the English Admiral not thinking it desirable to pursue them. The orders of the French fleet were to defeat the English, and recapture Corsica; but finding they could not do so, they abandoned the latter. A few days afterwards we find Nelson at Porto Ferraio.

Agamemnon, PORTO FERRAIO, March 24th, 1795.

MY DEAR SIR,—Admiral Richman has no doubt informed you of my little encounter against the enemy, and of the few opportunities for any officer to distinguish himself; all were anxious, and save I am, had the breeze only continued, we should have given a decisive and destructive blow to the French fleet. The *Minotaur*, in a game of wind, was driven on shore between this place and Leghorn; but have the greatest hopes of saving her. Our information from Genoa is that the *Sans Culotte* is in the Mole, and that the French fleet were seen steering to the northward of the *Illes de Minorca*; other accounts say they are in Tonkin, and the troops broke; others that they are now in Yolo Bay. I believe the *Tonkin* account, for what should a crippled fleet do without the resources. Gratefully commended the troops destined for Corsica, and when they had lost our fleet, he was to have been landed with 5,000, and the 10,000 embarked at Tonkin were instantly to have joined him.

Admiral Richman's letter from Leghorn, dated the 1st February, saying that he had acquainted Lord Spencer he was ready to proceed to his command, but that the *Victory*'s men were drafted on board Lord Howe's fleet; therefore he could not sail till their return. By our reinforcements' arrival we are with 14 sail of the line, more than enough; therefore, I am not disposed to let the enemy choose to cover a disembarkation, we cannot hinder them. Any number of transports might have safely navigated these seas during the week we were in sight of them.

I have best respects to Lady Hamilton, believe me, dear Sir, your very faithful servant,

HENRY VIVIAN.

N.B. Britannia, P. Royal, St. George, Windsor Castle, Captain, Fortitude, *Agamemnon*, *Tascher*, *Bellevue*, *Terrible*, *Diadem*, *Egypt*, all ready for service; *Bleeker* and *Dunlop* Castle at Leghorn.
Rt. Hon. Sir William Hamilton, K.B.

In all Nelson's letters written at this time we find expressions of regret that Lord Hood is not with the fleet, and allusions to the comparative inferiority of Admiral Hotham, whom he regarded in many respects as an excellent officer, but slow, and deficient alike in energy and largeness of views. He blamed Hotham severely for suffering the French fleet to escape, when, by following up the advantages gained by the gallantry of the *Agamemnon* and the *Isaacdore*, he might have effectively crippled the enemy. The following passage, in a letter to his wife, written at this time, depicts the whole situation, and throws a light upon Nelson's character, which can be obtained only from his most intimate correspondence. "I wish to be an admiral, and in command of the English fleet; I should very soon either do much or be ruined. My disposition cannot bear tame and slow measures. Sure I am, had I commanded our Fleet on the 14th, that either the whole French fleet would have gained my triumph, or I should have been in a confounded scrape. I went on board Admiral Hotham as soon as our firing grew slack in the van, and the *Claire* and *Chasseur* had struck, to propose to him leaving our two crippled ships, the two prizes, and four frigates, to themselves, and to pursue the enemy; but he, much cooler than myself, said, 'We must be contented; we have done very well.' Now, had we taken ten sail, and had allowed the eleven to escape, when it had been possible to have got at her, I could never have called it well done. Goodwill (the Vice-Admiral) backed up; I got him to write to the Admiral, but it would not do; we should have had such a day as, I believe, the annals of England never produced. I verify that which if the Admiral can get hold of them once more, and he does but get us close enough, that we shall have the whole fleet. Nothing can stop the courage of English seamen." The anxious desire for the return of Lord Hood to the fleet is constantly expressed in subsequent letters. In one letter he says, "His absence is a great national loss;" in another, "We have lost much by Lord Hood's going to England, and much more, probably, by his not returning." In another, "Truly sorry am I that Lord Hood does not command us; he is a great officer; and were he here we should not now be skulking." In a fourth letter, he calls him "the best officer, take him altogether, England has to boast of." Lord Howe certainly is a great officer in the management of a fleet, but that is all; Lord Hood is equally great in all situations which an admiral can be placed in. As to Admiral Hotham, he says frankly that he does not consider him intended by nature for a commander-in-chief, "which requires a man of a more active turn of mind;" and, in another place, he says, "Hotham must get a new head; no man's heart is better, but that won't do without the other."

The want of men is a constant complaint throughout these letters. The deficiency of the English fleet in respect both of men and ships, wrings from Nelson many a remonstrance against the authorities. "Nothing," he writes, "this war has been half so badly managed as we find the new Admiralty." From Leith, in May, he says, "we have been here a whole week, expecting every hour to hear something from England, but nothing comes to us. The Admiral has not a scratch of a pen for a month past; no reinforcements arrived, nor have we heard of their having sailed." This made them look with the greatest anxiety to any help they could get from Naples, although Nelson thought very indifferently of the Neapolitans as seamen, and did not hesitate to express his opinion that they were unable to keep the sea beyond a passage.

In the beginning of April the ships went into St. Fioravante, to refit; and soon after sailed for Minorca, to ascertain what the Spaniards meant by twenty-one sail of the line that were then lying in Mahon. For nearly two months they continued in this way beating about, "doing nothing," as Nelson describes it, "waiting for Lord Hood," their operations being at a standstill for want of ships. At last, in the middle of June, Admiral Maitland, not Lord Hood, joined them with a squadron from England, bringing Nelson a letter from Lord Spencer, acknowledging his claims, and promising to reward them when a proper opportunity should offer. Nelson's thoughts, upon receipt of this intelligence, immediately reverted to home, and he wrote to his wife, communicating the good tidings, and adding that he hoped to save his pay, "which," he continues, "with a little addition, will buy us a very small cottage, where I shall be as happy as in a house as large as Holkham." Early in the following month, he had the satisfaction of learning that he was appointed Colonel of Marines, an honorable and profitable sinecure, which, at that time, was conferred on three, and afterwards on four, post-captains for good services, to be relinquished on obtaining the flag. This mode of rewarding gallantry has been abolished, and good-service pensions substituted in its place. No man ever earned much recognition more nobly. "I have to lament," says Nelson, writing to his brother at this time, "what no officer can say now, or any other that I know, of being, in 15 months, 110 days in action at sea and on shore."

Very weary was this long watch of the French fleet: Nelson, at one time, with a couple of frigates, chased for twenty-four hours the enemy; at another, baffled of coming to close quarters by the wind, and always missing the prize which seemed close at hand. Banging along the coast of France, in co-operation with the Austrian army, which had its outposts at Legna and Vado, some relief was obtained from the necessity of the dreary look-out, by seeing all vessels bound to France, or to places where French troops were known to be.

But Nelson was giving way under the harassing life he had been lately leading. "I find my exertions have been beyond my strength," he says, in one of his letters. "I have a complaint in my breast, which will probably

bear me down; but please God, if I see this campaign out, if *Agamemnon* does not go to England, I must, the medical people tell me, be on shore for a month or two, without the thoughts of service."

Towards the end of the year 1793, a proposition was made to him to enter Parliament; but by whom, or under what circumstances, has never transpired. His reply was honest and manly. He was a Whig in principle—a sound Whig of the Portland school; he had been actually engaged in battle, by land and water, more than a hundred times, and had been twice wounded. These were his pretensions. If necessary, he would come to England; but he hoped it would not be necessary, as he was engaged in active service. From certain expressions in his letter, it would seem that the offer came from the Admiralty, or the Duke of Portland; at all events, that he was to be supported by Government influence. However that may be, the proposal came to nothing. Nelson never held a seat in the House of Commons.

Admiral Hotham struck his flag on the 1st November, and was temporarily succeeded by Sir Hyde Parker, until the arrival of Sir John Jervis, afterwards Earl of St. Vincent, who took the command of the fleet towards the close of the year, when Nelson went to Leith to refit. The favorite *Agamemnon* was in a deplorable condition—every mast, yard, and sail, even to the rigging, had been shattered by shot, and her hull was kept together by cables sewed round. In January, 1794, Sir John Jervis offered him the *Claire*, *George*, of 24 guns, or the *Zelus*, of 174, but he declined them, out of regard for his faithful crew and his riddled ship. The *Agamemnon*, however, was sent home, as unfit for service; in June, when Nelson hoisted his broad pennant on board the *Cyprian*, 74 guns, but not until he had crowned his old ship with a farewell laurel, by making capture of two vessels of war and five transports, off Onchia.

At Leith, and Genoa he maintained a strict blockade, with as much tenderness as could possibly be shown to the inhabitants, who were placed between two fires. In September and October he was at Bastia, from whence the following letter is dated. The subject is of historical interest. In consequence of the alliance with Spain, the Government at home had resolved to evacuate Corsica, a measure which Nelson condemned, and which the English Viceroy of the Island, Sir Gilbert Elliot, regarded as dangerous and ignominious. Sir John Jervis's instructions to Nelson, when ordering him to Bastia to undertake this service, show exactly what was desired to be done:—"Having received orders to co-operate with the Viceroy in the evacuation of the island of Corsica, and afterwards to retreat down the Mediterranean with His Majesty's fleet under my command, I desire that you will lose no time in going over to Bastia, and consulting with the Viceroy upon the best means of performing the operation." Sir Gilbert Elliot, to whom reference is here made, was originally sent to Corsica as Commissary Plenipotentiary, and, after the cession of the island, appointed Viceroy, which he held till this time, when it was evacuated. He was afterwards created a peer, by the title of Lord Minto, subsequently raised to an earldom, with a royal grant to wear the arms of Corsica, on a chief, over his family ensigns. He subsequently acted as ambassador to Vienna, and held the important offices of President of the Board of Control and Governor-General of India.

BASTIA, October 18, 1794.

MY DEAR SIR.—The Viceroy will write you so fully that it would be impertinent were I to say more, than the joy I feel at the resolution taken, and that I may claim some merit with the King of Naples for my steady support to His Interest, which, in good truth, he highly deserves; not a little must be attributed to Sir John Acton and yourself, and I have full confidence that the conduct of Naples will continue to be such that we may pride ourselves for our advice; the greatest confidence must be placed in us, and nothing like jealousy. God knows I only feel for the King of Naples, as I am confident the change in his Government would subvert the interest of all Europe. He has a narrow-minded party to war against, but I feel above it.

I shall only ask, that I will still endeavor to prove myself the same active officer which the world has seen I am.—With kindest respects to Lady Hamilton, believe me, your most faithful, humble servant,

Sir William Hamilton.

HORATIO NELSON.

October 19.—We have just got the Admiral's consent, and you will receive his despatches. Galleys must be sent immediately to Elbe, and be at our disposal; and the ships should join our fleet as soon as possible; they may come safely to Elbe, and thence form the junction. Port Capra must also be partly fortified by us. We should not answer it to our Country was anything on which depends the safety of our fleet and army left to chance.

I do not think it impossible but I shall soon be sent to Naples. As the ships are ready, I may impress Sir John Acton with the great importance of their sailing.

H. N.

As our stay in the Mediterranean is a secret, and not told to Captain Keilich, you must tell him to come to Port Ferrajo; his orders are for San Fiorenzo, where we shall not be.

The "resolution taken," to which Nelson alludes in this letter, was the resolution not to abandon the Mediterranean, which Sir William Hamilton afterwards ascribed solely to the joint exertions of Sir Gilbert Elliot and Commodore Nelson. Government had scarcely ordered the evacuation of the island, when they wished to rescind their determination, and sent out orders to that effect; but it was too late, the evacuation was already accomplished.

As soon as this business was fairly over, Sir John Jervis ordered Nelson to Gibraltar, and from thence to take the command of the naval force at Porto Ferrajo. Sir John wrote at the same time to Sir William, saying that the command could not be in better hands than in those of Nelson, than whom, he adds, a more able or enterprising officer does not exist.

[To be continued.]

Reviews of Books.

THE CANTON NOVELS.*

Thus, the first branch of a new edition of the novels written by Sir Edward Bulwer Lytton, consists of "The Canton Family," "My Novel," and "What Will He Do with It?" Taken alone, these volumes are sufficient to establish a great and lasting literary reputation; taken in conjunction with the works of fiction by the same author, they present a more complete and marvellous fertility of invention, and vast comprehension of mankind. There is but one word to account for such varied and inexhaustible powers—that word is GENIUS. "Nullum quod non erant levitatem" was justly applied to Colburn, and his cabinet gems well merited the tribute; and how much more extensively may it be attributed to the producer of a whole universe of precious works, each vying in kind in brilliant succession, dazzling with different lustres, and augmenting in value from their relative blending and the completeness of the collection. Eastern tales astonish us with descriptions of palaces of gold, and jewels, and diamonds, raised by the winds of mighty magic, and blazing with unimaginable splendour, which another wave of the incantation dissolves into thin air. The fabric vanishes. We have, for the moment, allowed ourselves to be carried along with the gorgeous spell, and whisper, "Can such things be!" and our dream is over. But the magic of the Pen surpasses the wonders of the driving rod, the lamp of Aladdin, the seal of Solomon. The talismans it holds are more sumptuous than gem or jewel; their occupants are creations of an infinitely finer nature; their vicissitudes are of a real and deeper interest; and the lessons they inculcate remain. They last for ever; and we return again and again to admire their glory, to enjoy their beauty, to feel their influence, and to appreciate their wisdom.

Can the Novel effect all this? "A Novelist," in common application, is but an inferior title in the rank and order of Literature. The Historian is a grand name; the Poet still more exalted, and truly the top of all, when glancing from Heaven to Earth and Earth to Heaven, embodying the sublime and filling the world with immortality. The Novelist, with the exception of the humble name, is often, as in the instance of Sir Edward Bulwer Lytton, endowed with the higher gift of poetry, to unite with other elements; and, if it be the boast of History to teach by example, assuredly it must be conceded to the novel to be at least equal for the ministrations of virtue and truth and the improvement of humanity.

* The noblest study of mankind is Man."

Let us see how we study him in history—individually. As far as we can ascertain his character, he is crowned monarch, or ambitious usurper, or learned divine, or trained judge, or victorious warrior, or astute statesman, or intriguing politician, or millionaire merchant, or any other of that upper class who figure in national annals. In truth, we can know very little about them; yet we pretend to dive into their inmost souls, to balance their motives, to develop the causes of their actions; in short, Frankenstein-like, we make our man, and set him on his own legs, as a model to be copied, or an example to be shunned. Thus, History, whilst offering great light for public guidance, cannot, in reality, be said to afford the best study of man for the instruction of his fellow-creatures—Man. History, in short, is an aggregate of biographies; and if, as we believe, a single biography must partake as much of what is called the "novel" as of what is called the "history," looking merely to the crowd, we may be still more widely led astray and mistaken. Now, with regard to the competent Novelist, there is no limit to his observation. The entire living world is before him to study. He is not peering through clouds at kings, and ministers, and heroes, and sages, to guess what they have thought, and what has moved them, and what course or that. He is mixing with his subjects in daily and familiar intercourse. He can study them in prosperity and adversity, in joy and sorrow, in happiness and trouble, in wealth and poverty, in health and sickness, in society and solitude, in ease and trial, in hope and failure, in innocence and guilt; he can pursue his converse over an unbroken continuance of time—from one and all he can select his materials, and, like the ancient sculptor, carve them into the desired form, and arrange them in the necessary groups. The historian copies from old designs and distances; the novelist chooses his models, and paints from the life.

And from many-colored life has Sir Edward drawn. His position has been most fortunate, enabling him to deal with the substances, not the shadows, as the bases of his fictions, if those can be called fictions which are only contrivances of events and situations for the exhibition of men and women as real as are ever met in actual existence. The Canton series, in particular, we must acknowledge as bringing us so close to the scene of our own flesh and blood, and showing us how, under the circumstances of the case, they would naturally act according to the qualities with which it has placed their author to clothe them. They belong principally to the upper middle-class; but when, as in the last, "What Will He Do with It?" the scene ranges among the aristocracy and higher regions of politics, we find ourselves, in daily life with respect to truthful portraiture, and learn that it is not begun without reaping fruits, accessible but to very few, that the writer has associated within the closest bounds with legislators and ministers of state,—persons *pari passu* might be his unquestioned motto.

To be at the heart of the matter in England is a great station. Fitting the age in which they lived, and the manners that surrounded them, Richardson and Fielding hold sovereign sway, and Smollett was great in his line, and Scott was indeed the Wizard of the North. And we can speak of living writers, whose fame will also go down to posterity as the delight and honour of our present age. But when we glance at the extraordinary extent and the diversity of the productions of a Bulwer, and reflect on the fact that they are but emanations, floated, as it were, from amidst labours and duties of the most onerous nature, we are lost in astonishment. And the more, as nowhere is mediocrity or superficiality to be discerned. Bulwer is far removed from the herd of the *faux auteurs* of the *feuilleton*; he is sterling throughout, and never can be misunderstood, because he knows what he means, and how to communicate it most intelligibly. His style is always

plain, strong, nervous,—when requisite, eloquent, pathetic, passionate. The English language could not furnish quotations more admirable than many passages we could point out in these volumes. In construction, too, there is everything to captivate the mind. The plot is "What Will He Do with It," or rather the incidents which keep curiosity on the stretch, and attract to the last "surprise," do not hinge upon actualities, but upon the attributes and feelings of the principal characters, and to work these out, the writer has to dissect their inmost hearts. This he has done with exquisite skill, and while abnormal deformities are rebuked and prejudices exposed, the pure interests of morality and Christianity are advocated, without a word that reveals the idea of teaching, and penetrates far more deeply than the arid rail of eager proselytism. The foundations of the really good novel—of the production that will inform, improve, and delight the time, and descend to future ages as a genuine picture of things and manners,—are chiefly imagination, common sense, judgment, and propriety. Without these, a work that professes to be nothing beyond mere pretence. With them, and great natural talent, and cultivated taste, and practised industry, the work may be accomplished, but the qualifications and endowments are very rare, and therefore it is that we have so few specimens of success. When we do meet with them, as *here*, we cannot prize them too highly. They are most useful and almost original methods of directing our views to righteous principles, both as affects ourselves and others; impressors of virtue and reprovers of vice, teaching without dogmatism, and promoting progress and happiness most effectively when seeming almost a mere amusements, a play for the leisure holiday, and a rest and a change to the weary and busy life.

For so much and so large a contribution to the social happiness of a countryman are we indebted to Sir Edward Bulwer Lytton.

AUSTRALASIAN NATURAL HISTORY.*

EVER since its first discovery, the Australian land has been remarkable for the variety and peculiar forms of animal and vegetable life it presents to the traveller. Its productions are very much unlike those of the country. It has little blossoming on stems high; stinging nettles rising, like palm-trees, to the height of 140 feet, and then branching off in a crown of leaves; and a gaily vegetable protuberance hardly worthy of being called a tree, growing in an arid soil and dry atmosphere—whose birth is often considerably greater than its height, whose fruit ripens when the leaves have fallen, and whose trunk yields an enormous quantity of nutritious manna. The animal kingdom is no less singular and anomalous than the vegetable. Of the native birds several are wingless, some burrow in the ground, and some build for themselves huts not used as nests, and little inferior to those of the native savage tribes. A very unusual proportion of its reptiles are venomous, and almost all its quadrupeds are provided by nature with a singular pelt, enabling them, as Professor Owen has said, "to carry their delicate prematurely-born young about with them wherever they go, in a soft, warm, well-lined portable nursery-pocket, or perambulator." The surrounding sea is no less remarkable for their fish and shells than the land. Its extraordinary corals, and its reptiles, and thus the whole country teems with material of the best kind for the naturalist.

Dr. Bennett, in the work before us, has added one more to that valuable, but small, list of natural history books which are full of amusing anecdote for the general reader, and abound with results of minute personal research appreciated by the naturalist—looks at the world in a different light, never grow old, and can hardly be superseded, but which in time are treated as queries from which the constructive material of scores of volumes is regularly compiled. Of such books Gilbert White's "Sylviculture," stands in the first rank, while Broderick's "Zoological Recollections," and Waterton's "Wonderful and Wonderful," are regarded as other distinguished examples. Dr. Bennett has done for Australia what Waterton did for Brazil, and has made us acquainted with the personal and private history of such of the animals and vegetables as he was able to observe. He makes no attempt to generalize, or inform us of what other people have said of other matters than those he is interested in; but is a little too apt to be diffuse in second-hand narrations where his own observations by themselves would have been sufficient for his purpose.

In illustration of these remarks, we give our readers a brief abstract of his account of one of the most curious anomalies of the animal kingdom—the Smithornithus, a duck-like bird with the form of a snake, combining strange characteristics of quadrupeds and birds. No such account of this animal has yet been published, and it is the more valuable as given by so excellent an observer as our author.

Near a tranquil part of a river, with shaded banks, and amid luxuriant vegetation, the Smithornithus was first observed by the author, late in the evening, and chiefly in spring or summer. They are extremely dirty and shy, and are only recognised by their little mandibles slightly raised above the water's edge. They do not, however, lie continuously in the water, but burrow in the banks, having runs extending sometimes 40 or 50 feet, and these are extremely small, as the animal is very curious in its power of contracting its loose skin, to pass through an aperture apparently much smaller than its body. They feed on small insects and shell-life when full grown, but the young are meek. This, at least, is the conclusion arrived at—notwithstanding the difficulty of the operation with the bird-like mouth—and is confirmed by the natives, who, being asked how the young males fed, replied, "All same you white feller—first have milk-like, then make pips (eat) bread, yam, &c."

The offspring are born alive, and, when full-grown, are excellent food. They lie curled up together in a nest in so many hills, like hedgehogs. They are playful and animated, scratching and kicking, and tumbling over one another like puppies. "It was very ludicrous to see the uncouth little creatures open their mandible-like lips and yawn, stretching out the fore-jaws, and extending the webs of the fore-feet to their utmost expansion. Although this was natural, yet, not being in the habit of seeing a duck yawn, it had the semblance of being perfectly ridiculous." They climbed to the top of a brook-

* *Gleanings of a Naturalist in Australasia: being Observations principally of the Animal and Vegetable Productions of New South Wales, New Zealand, and some of the Austral Islands, by George Bennett, D.D., F.R.S., F.Z.S., &c. &c. &c. London: John Van Nostrand.*

case as a chimney-sweeper climbs a chimney, pressing the back against the wall, and scrambling up with the claws of the fore-feet. They lived for a time in captivity, fed on bread, chopped egg, and minced meat, but could not be brought over to England.

The curious bill enables the animal to strain the water from its food, which is conveyed into capacious cheek-pouches before being swallowed. The tongue is provided with horny teeth, and mud and sand is swallowed with the food, to assist digestion. The male has a spur like that of a game cock, and both male and female clean and dress their fur as a bird does its feathers. The voice is sometimes a squeak and sometimes a growl.

Among the birds of Australia Dr. Bennett gives some account of the so-called "Laughing Jackass," or "Settler's Clock," whose singular gurgling laugh and shrill scream mark the earliest dawn, and are heard after dusk. The "Native Companion," another bird of large size, is to be seen in the marshes, performing the most curious antics with its fellows, "perpetrating like opera-dancers when getting up a ballet. They figure away, devoting all their energies to dancing and jumping, twisting and throwing up one leg in the most graceful manner; then they will tumble upon the ground, feet uppermost, and finish by rolling about like dogs."—(p. 222.)

The "Mooruk," or Australian Casowary, is a bird whose existence was first made known by Dr. Bennett, and which is the more interesting as being almost the only living representative of a large family of wingless birds, formerly abundant in the southern hemisphere, but now almost extinct. It was found in the island of New Britain, and specimens have been brought to this country. The mooruk is a robust bird, with a stiff, feeble, but having funny little spicules for wings, and with the body covered with hair rather than feathers. In captivity it is bold, and easily domesticated, noisy and inquisitive. "One, or both of them," says Dr. Bennett, speaking of two kept in his house for some time, "would walk into the kitchen, and while one was loitering under the tables and chairs, the other would leap up on the table, keeping the cook in a state of excitement; or they would be heard in the hall or library, in search of food or information; or they would walk upstairs, and then quickly descend again, making their peculiar chirping, whistling noise. Not a door could be left open, but they were walking. They kept the servants constantly on the alert; if one went to open the door, on turning round he found a mooruk behind him. They seldom went together, generally wandering apart from each other. If any attempt was made to turn them out by force, they would start rapidly round the room, dodging about under the tables, chairs, and sofa, and then end by squatting down under a sofa or in a corner."—(p. 251.) These birds have a curious and dangerous habit of swallowing whatever comes in their way, whether butter or iron nails, eggs or corals, fruit or articles of ladies' dress; but in every case, the articles not approved of by the digestive organs were rapidly enough got rid of in an unaltered state.

We ought not to conclude this notice without directing attention to some admirable colour drawings, executed by Mr. Wolf, which serve to illustrate it. Like all Mr. Van Voest's books, Dr. Bennett's "Gatherings" is admirably got up, and, like most of them, it deserves to be so.

BRITISH RELATIONS IN CHINA.*

CAPTAIN SHEPARD OSBORNE, of the Royal Navy, had been engaged in his professional capacity for some time upon the coast of China; and in the volume now published he has given the public in possession of some very important geographical knowledge.

Captain Shepard Osborne's attention, whilst in China, was directed to the political events occurring around him. Taking the part of a gallant British sailor in two wars with the Chinese, he also exercised the privilege of a British subject, by studying the policy and laws promulgated by English statesmen, and obtaining an insight into the principles of government acted upon by the rulers of the gigantic empire with which he was engaged in hostilities. The results of all he had seen are to be found in this little volume; and the practical lesson which he would inculcate upon English statesmen and the British public in all present and future dealings with the Chinese is compressed in a single word—"FORCE."

"Force (no say) rather than argument, necessity rather than conviction, is the only rule by which a Chinaman can be made to agree with a European."—(p. 7.)

The European has ever to use force rather than argument to obtain his ends in China, he may however choose his weapons wisely.—(p. 71.)

"You cannot open China, but as an armed man—victorious. You cannot teach the rulers of China to respect their political engagements with a foreigner, except through force."—(p. 115.)

When Cardinal Ximenes was asked in a very peremptory tone, by one of the grandees of Spain, to explain his reasons for venturing to exalt the powers of the king at the expense of the nobles, the Cardinal invited the grandee to step with him to the window, and then, pointing to a park, the artillery drawn up in front of the palace, replied, "There are my reasons." According to Captain Shepard Osborne's description of the Chinese the "park of artillery" is the only argument intelligible by them; it is the only one that can influence their decisions; it is the only one to which they will patiently submit. He declares that when an Englishman has reasoned upon any Chinese question, the best thing for him to say,—"I think this is the right thing to be done; but because I think it is, then I am quite sure the emperor, mandarins, and Chinamen will come to an equally opposite conclusion, and act accordingly." He makes, too, this very extraordinary statement—

"I never remember any European who took an European, and I grant, rational view of China, who was in the end right."

What, then, is to be done with a people who are not influenced by reason,—who do not believe that men act from motives of humanity, or honour, or rectitude? The simple mode of solving such a question, if it referred to an individual, would be to say—"Have no dealings with him; keep away from him." But you cannot so act with the Chinese. As the author puts

the matter plainly and distinctly, there is no shrinking away from it. "We cannot exist without tea and silk. We want that huge market of four hundred millions for our manufactures. The exchequer of Britain and India need the revenue already derived from the trade in tea between us." This being the state of affairs between England and China, and as relations between the two countries must be maintained, then in what way are they to be continued, and how best preserved? Captain Shepard Osborne answers the question with the vigour of a Ximenes, and the bluntness of a British sailor—"BY FORCE."

"We want (he observes) the Chinaman to act as we think best, without using force, or without apparently consulting our own interests. The result is constant sickening, or elaborate use of large forces, whereas if you simply started on the ground of 'You must do so and so,' the Chinese intellect would appreciate the consequences, and yield. We are barbarians, and unaccountable under all circumstances; nothing we can say or do will alter that opinion of us; do, therefore, what is right, and merely consult our own conscience and the interests of our country."

The author then candidly avows what he considers would be the right thing to do. He is at first beginning with "an energetic and prudent series of military and naval operations," first, for the purpose of exacting a fulfilment of every clause in the Treaty of Tientsin, as well as for the punishment of those who broke that peace which he promised. He is next for enforcing the right of the British to trade with every part of China. He points to this very important fact,—viz., that at present British trade is limited to a small portion of China, and that native as well as foreign monopolists have a common interest in so restricting it; whilst, by carrying on hostile operations to the north of beyond all our present mercantile operations, the two great advantages would be gained,—the opening up of rich regions populated by Asiatics in a high state of civilization, who would all become customers when "they saw Englishmen appearing in a military character;" and next, it would impress upon the Chinese Court this important fact, that the slaughter of the British at Canton was not an act to be passed over without an indemnity for its future recurrence.

We do not enter into all the arguments brought forward by the gallant author in support of his views. They are clearly stated and fully explained in his work; and, though the public may hesitate before it comes to the same conclusion as he has arrived at, he has arrived, still, at a point of view that is borne in mind, that the opinions here put forward are those of a well-informed man, who has devoted several years to the study of the subject on which he writes; that he has made personal acquaintance with the Chinese; that he has been in the midst of them, and that no other motive can induce him to betray the desire to overthrow his country,—to injure his people, his interests as a commercial nation, as he had in view maintained the honour of the British flag.

"THE WOMAN IN WHITE"—A NOVEL.*

"THE WOMAN IN WHITE" is a republication from Mr. Dickens's serial, "All the Year Round." The tale was, as we understand from the preface to the present edition, received with a "warm welcome among English and American readers." The author now appeals to three classes of persons, in the hope of obtaining their approval:—first, to those who know his story as it was weekly narrated; next, to those who will not permit it to pass in its entirety; and lastly, to the reviewers or critics, from whom he asks the favour of not "telling his story at second hand."

We cannot venture to express an opinion as to what may be the feelings of persons who may undertake a second perusal of "The Woman in White." Our duty is, whilst complying with the author's request, of so pointing out, by trying to tell his story for him, to give an honest and unbiased opinion as to a book which we have now read for the first time.

"The Woman in White" is, in our judgment, a very interesting book—not equal in all its parts; but still a novel which justly may claim a high rank among the light literature of the day.

The plan on which the work is constructed has the merit of novelty. "The story of the book is told throughout by the characters of the book. They are all placed in different positions along the chain of events; and they all take the chain up in turn, and carry it on to the end."

This is not only a new but a very good idea. It is much better than the old and now long-disused plan, of telling a story in a series of letters; and if it could have been carried out, in perfect accordance with the characters of the several persons introduced, would be entitled to the highest praise. The author has not been able to act upon his own idea, because he wrote a tale to be published in a periodical; and, as the King "embodied" vein of publication is, that every portion must be *fitting*;—that is, it must be so, that there shall be no pause, nor rest in it—every particle must be glittering with points, or glaring with excitement. And so it is with the "Woman in White." All the characters, by whom the story is supposed to be told, "must speak in passion, and all of course 'do it in the King 'embodied' vein." The duty of Mr. Wilkie Collins, as a narrator is, in his minute observation of the most trifling circumstances which can aid in the portraiture of an individual; and every one that he introduces as a narrator has the selfsame complication. The attractions of the tale are intensified, because it is so told; but then what it gains in interest it loses in skillfulness of narration, and in truthfulness. It is no more like what a real statement of facts would be if actually detailed by each of the persons introduced, than one of Doctor Samuel Johnson's Pitt-and-Pultney debates, as invented by him for an old magazine, was like a real parliamentary debate in the House of Commons between the same men when using their own language, and so giving expression to their own thoughts, and their own feelings. The debates were far superior to the originals. They were entitled to admiration, and better worth reading than the most accomplished short-hand writer's notes; but for all that they were not what they pretended to be. The named doctor made orators of men who only made peasants. And now it is with Mr. Wilkie Collins's characters. They all write too well, and they all write with the same skill, sharpness, and microscopic talent of observation; and it is often difficult to tell—especially in those portions ascribed to the hero, and the sister of the heroine—which holds the pen, for the calligraphy

* The Past and Future of British Relations in China. By Captain Shepard Osborne, C.B., Royal Navy. Author of "A Cruise in Japanese Waters." Wm. Blackwood and Sons, London and Edinburgh, 1860.

* The Woman in White. By Wilkie Collins, author of "The Dead Secret," "After Dark," &c. &c. Three Volumes. London: George Allen, Son, & Co. 1860.

is the same, and the capital letters are all finished off with the same ornamental flourishes.

The defect—the main, and we might even add, the only defect in the book—is more than compensated for by the manner in which the story is carried forward. The reader has little reason to complain of it, because he is repaid in the perusal by an untiring succession of incidents, which absorb his feelings, and keep his attention constantly on the alert.

As a specimen of the shrewdness of the author, and the manner in which he distributes his gift amongst his different characters, we present the following brief extracts:—

"Our words are giants when they do us an injury, and dwarfs when they do us a service."—Vol. i., p. 96.

"There may be many varieties of sharp practitioners in this world, but I think the hardest of all to detect are the men who conceal you under the disguise of inveterate good-humour. A fat, well-fed, smiling man of business is, of all parties to a bargain, the most hopeless to deal with."—Vol. i., p. 215.

"When two members of a family, or two intimate friends, are separated, and one goes abroad and one stays at home, the return of the relative or friend who has been travelling always seems to place the relative or friend who has been staying at home at a painful disadvantage, when the two first meet."—Vol. ii., p. 26.

"Most men show something of their dispositions in their own houses which they have concealed elsewhere: and Sir Percival has already displayed a mania for order and regularity which is quite a new revelation of him, so far as my previous knowledge of his character is concerned. . . . He picks up stray flowers from the carpet, and mutters to himself as discontentedly as if they were hot riders burning his legs; and he storms at the servant of there is a crease in the table-cloth, or a knife missing from its place at the dinner-table, as fiercely as if they had personally insulted him."—Vol. ii., p. 33.

"Women can resist a man's love, a man's fancy, a man's personal appearance, and a man's earnestness, but not a man's tongue, when he knows how to talk to them."—Vol. ii., p. 103.

"Men little know, when they say hard things to you, how well we remember them, and how much harm they do us."—Vol. ii., p. 167.

"Any woman who is sure of her wit is in a most tactful, at any time, for a man who is not sure of his own temper."—Vol. ii., p. 188.

"When an English lady has to choose between a plain coat on the surface, and a long explanation under the surface, it always takes the fact in preference to the explanation."—Vol. ii., p. 115.

"The English intellect is sound, so far as it goes; but it has one grave defect—it is always cautious in the wrong place."—Vol. iii., p. 307.

All these sharp remarks and pungent sayings are ascribed by the author to different individuals. Here and here, the honest man and the villain are all equally clever. This is not in accordance with the Shakespearian maxim:—

"To frame artists, Art both then decreed,
To make some good, but others to exceed."

And now come those considerations with which we have mainly to do. Is the book taken as a whole, entitled to the same amount of commendation bestowed upon it when it was published piecemeal? What is to be said of Mr. Wilkie Collins as a writer of novels? Is the "Woman in White" entitled to a white or a black mark "etiam an æthere nota"? We feel not the slightest hesitation in expressing an opinion on these points. "The Woman in White" is a most interesting book. It will richly repay perusal.

A SONG. (FOR MUSIC.)

My false love sailed off the wide world main,
The blossoms fall when the tempest blows—
And left me alone to my sorrow and pain;
Green is the grass beneath the moon:
And I never shall see his face again.
Sing, Hey the green Holly—the Ivy, oh!

But the tall tree leaves the sudden blast,
Though the blossoms fall when the tempest blows,
And the days to come may be fair as the past—
Green is the grass beneath the moon:
And my first love need not be my last.
Sing, Hey the green Holly—the Ivy, oh!

Let him go—I'll neither weep nor sigh:
Though the blossoms fall when the tempest blows,
After the cloud comes a light in the sky—
Green is the grass beneath the moon.
And somebody loves me, and somebody's sigh.
Sing, Hey the green Holly—the Ivy, oh!

ILLUMINATION ON PAPER.—One of the Medival arts is reviving amongst us, and a very charming one. It is the illumination of books, to which a peculiar value is attached by their possessors—such as prayer-books, bibles, almanacs, &c. At one period it was considered impossible to reproduce the glowing colours, the fanciful designs, and the gorgeous decorations which render the MSS. of the twelfth, thirteenth, and fourteenth centuries so precious in the estimation of artists and antiquarians. The distrust in modern skill to rival the productions of bygone times is fast yielding to the perseverance of students, and the resources of modern skill, aided by recent discoveries in chemistry. The capability of decorating a book in the manner of the monastic illuminations, whether it be effected on paper or vellum, constitutes a charming female accomplishment. There is a probability that this accomplishment will be considerably popularized by the aid of such a work as the "Manual of Illumination," for which the public is indebted to Messrs. Wm. & A. Norton, of Bathoane place. All that the learner can desire to know about materials, colours, pens, brushes, colouring, gilding, &c. is imparted in a little work, enriched with illustrations, and sold at a price that makes it a marvel of cheapness.

WILLS AND BEQUESTS OF EMINENT PERSONS.

THE HONOURABLE MAJOR HERBERT GARDNER, of Her Majesty's Army, was the son of the first Lord Gardner, a distinguished naval commander. The late Major was a resident of Southampton, where he died recently, at the age of 79. He made his will on the 1st of December, 1859, which was proved in London in the usual course by Miss Eleanor Gardner, his daughter, the sole executrix. This gallant officer has bequeathed—we give the terms he himself has expressed in the will—"all my property, money, securities for money, and all other estate and effects, real or personal, to my wife, my daughter, in full and as her own absolute property." There are some exceptions of a very kind character. The will is attested by H. Harris, solicitor, Southampton, and James Figg, servant to the major.

SIR ADMIRAL SIR GEORGE RICHARD ROBERT PERRELL, Bart., M.P. for Brighton, late of Castle Goring, and of Aldwick, both in Sussex, of which county he was a magistrate, died at his town residence, Hill-street, Berkeley-square, on the 23rd June last, aged 71. The will of this distinguished officer was proved so recently as the commencement of the present month, and the personally was sworn before EDMUND PERRELL, Esq., who was granted his relic, the Lord of the Peckell, the daughter of the late Lord De-la-Zoedde, as the sole executrix, who is the only party benefited under the will. Admiral Perrell having bequeathed his entire property, both real and personal, to her ladyship absolutely, Sir George Perrell had three children, an only son and two daughters, the latter both married to persons of distinguished rank. His only son and heir, who was a Captain in the 7th Foot, was killed in the trenches at Sebastopol; this unfortunate circumstance caused the title to devolve to his cousin, the present Sir George Stansfeld Perrell, Bart. This public official, who is the sole executor for the length of his naval service, was the son of the late Major-General Sir Thomas Perrell, Bart., and brother of Rear-Admiral Sir Samuel John Brooke Perrell, Bart., C.B., K.C.H. His mother was the daughter of Lieutenant-General Sir John Claverhouse Bampfylde, K. Comyngham, of Inverary.

THE REVEREND CANON RYTON, of the Cloisters, Westminster, and of Shoreham, Kent—This clergyman, who was a Canon of Westminster, and Rector of Shoreham, and the incumbent of St. Philip, Regent-street, London, died on the 6th of August last, at St. Leonards-on-Sea, Sussex, in the 79th year of his age, he was born on the 19th of May, 1781, and was educated at the University of Cambridge. The Reverend Canon Ryton entered the Holy Orders at an early period of life, and received the Preferment of Canon of Westminster in 1830; the income derived from this appointment produces £1,000 per annum. He was instituted to the Rectory of Shoreham in 1833. We understand that he is succeeded in the Rectory by the Reverend Evan Nepean, who was formerly the Rectory of Heydon, Norfolk, as well as the appointment of Minister of Grovesend Chapel, South Aldford street, London, and is one of the Chaplains in Ordinary to Her Majesty.

FRANCIS O'CONNOR, Esq., M.P. for Nottingham, although so long deceased, his will was not presented for probate until the 23rd of August of the present year. At the time of making his will he resided at Nottingham, Daywater, where he died on the 5th of August, 1855. The testator, it may be remembered, was managing director of the National Land Company, and also proprietor of the North-Eastern Railway, from the commencement of which latter company he bequeathed several annuities; and it is much to be regretted that the recipients of his bounty are not now benefited, owing to that journal having become extinct. As managing director of the National Land Company he has directed in his will that all his accounts of the said company, in which he was in any way mixed up, should be placed in the hands of an accountant for inspection. This reflects much credit upon the conduct of Mr. Francis O'Connor, and arose, no doubt, from that scrupulous and gentlemanly feeling which must necessarily pervade the mind of all honourable persons placed in responsible and trustworthy positions. There is a mass of papers, consisting of letters, and which have reference to his late father, and also many of his own; the letters belonging to his late father appear to be of a very interesting character, as Mr. Francis O'Connor observes in his will. His late father, who was one of the most eminent and distinguished persons in the kingdom. These documents Mr. Francis O'Connor has directed his executor to destroy, and by no means to allow them to meet the public eye. The will bears date the 10th of April, 1848, and is entirely in his own handwriting, and was witnessed by Thomas Clarke and Philip McGrath, of Regent-street, London.

LUKE THOMAS FLOOD, Esq., was formerly of Belle Vue Lodge, Chelsea, and late of Beveridge Lodge, Brighton, where he died on the 21st of June last, aged 81. His will bears date the 21st January, 1856. This gentleman was a solicitor for the counties of Hertford, Sussex, and Middlesex, and also for Westminster and the Tower Hamlets, and a Deputy-Lieutenant for Middlesex. He died possessed of much realty in the above-named counties, and elsewhere, as well as personally, of a mixed character, amounting to £75,000. To his testamentary executor, a large amount of property, arising from the receipts of his various estates. His freehold bequeathed out between his relic, his son, and his daughter, the wife of the Rev. George France. To his son, Luke Trapp Flood, who is also a magistrate and deputy-lieutenant for Middlesex, he bequeathed all his estate in the neighbourhood of Chelsea, and appointed his residuary legatee. The testator has directed the sum of £1,800 to be invested, and the dividends arising therefrom divided fourfold for his domestic, for their respective life. The executors are L. T. Flood, G. F. Conrad, L. F. Cutbush, and E. C. Cutbush, Esq., who are all solicitors.

THOMAS HOLBY, Esq., of White Barns, near Buntingford, Hertford, and of Linsford, Cornwall, who died on the 6th of August, 1860, at the age of 82, had made his will on the 23rd of December, 1858, appointing as his executors his wife, together with his only son Thomas Holby, Esq., who was in his own name on the 1st of the present month. The personally was sworn under £5,000. This venerable gentleman, who was a Magistrate and Deputy-Lieutenant for the counties of Cornwall, Hertford, and Middlesex, possessed estates, which, together with his personal property, he bequeathed to his wife, in the following manner, viz.—he confirms the annuity of £500 secured to his wife on their marriage; also gives to her his furniture, plate, pictures, books, &c.; carriages, horses, and harness; added to these he leaves to her a policy of insurance, with his life insurance policy, and a life annuity of £100 per annum. The residue of the personally, bequeathed upon his only son Thomas Holby, Esq., late of B.M. 30th Foot.

NOTICE OF TRANSFER.—Notice is hereby given, that the business of the **SCHOOLMASTERS' and GENERAL MUTUAL ASSURANCE SOCIETY** has been transferred to the **CHURCH OF ENGLAND LIFE and FIRE ASSURANCE TRUST AND ANNUITY INSTITUTION**, of Louth, in the County of Lincoln, and that all claims in respect of Assurance effected with the Schoolmasters' Society will be paid and discharged by the Directors of the Church of England Assurance Society, by order, **WILLIAM EMMENS, Manager.**

Church of England Assurance Society, Louth, Lincoln.

CHURCH OF ENGLAND LIFE AND FIRE ASSURANCE INSTITUTION.

Head Office, 15, Abchurch Lane, London, E.C.4.
Established 1850, and empowered by Special Act of Parliament, 4 and 5 Vic., chap. 98.

Francis Carr, Esq., Secy. and Actg. Mgr.
A list of the Proprietors particularly enrolled in the High Court of Equity.

LIFE.

This Institution adopts both the **PROPRIETARY and MUTUAL** systems of Life Assurance, and the policy-holders in both branches are fully protected by large accumulated capital of the company. The rates of premium are reduced in all cases so far as is compatible with security, and are especially favourable for young and middle-aged lives.

In the **MUTUAL** branch of the Institution, the policy-holders are entitled to the entire profits of the branch, thus enjoying all the advantages of a strictly mutual assurance society, together with the security of the accumulated capital.

In the **PROPRIETARY** branch, commurances may be effected in a great variety of ways, to suit the age, health, and circumstances of the assured. Amongst others, where the policy is made payable on the annual payment of 10 years of age, or at death, if that event should first precede. This mode of assurance is particularly desirable of students.

FIRE.

Premiums for assurance against fire are charged at the usual moderate rates, with a reduction of 10 per cent. on the residence and furniture of Clergymen and of Schoolmasters, and the buildings and contents of churches and church schools.

Prospectuses, the necessary forms, and every requisite information for effecting insurances, may be obtained on application at the Head Office, as above, or from the Agents of the company.

WILLIAM EMMENS, Manager.

The Royal Insurance Company is one of the largest offices in the Kingdom.

At the annual meeting of the 10th inst., the following highly satisfactory results were shown—

FIRE DEPARTMENT.

Notwithstanding the large increase of business made annually through a long series of years, which obviously increase the difficulty of further advance, yet the Fire Premiums of the year 1859 rise above those of the preceding year, by a larger sum than has been obtained by the increase of any single year since the formation of the Company, excepting the year 1851, evidencing an advance of 10 per cent. in three years. To this circumstance must be attributed the growing announcement that the accounts for the year show a profit of £12,500 3s. 6d.

The following figures exhibit the progress of the whole Fire Branch, running over the last year—

| Total Premiums Received. | Increase of the Year above each preceding year. |
|--------------------------|---|
| 1857.....£45,675 0 11 | 1858.....£45,675 0 11 |
| 1858.....£45,675 0 11 | 1859.....£45,675 0 11 |
| 1859.....£45,675 0 11 | 1860.....£45,675 0 11 |
| 1860.....£45,675 0 11 | 1861.....£45,675 0 11 |
| 1861.....£45,675 0 11 | 1862.....£45,675 0 11 |
| 1862.....£45,675 0 11 | 1863.....£45,675 0 11 |
| 1863.....£45,675 0 11 | 1864.....£45,675 0 11 |
| 1864.....£45,675 0 11 | 1865.....£45,675 0 11 |
| 1865.....£45,675 0 11 | 1866.....£45,675 0 11 |
| 1866.....£45,675 0 11 | 1867.....£45,675 0 11 |
| 1867.....£45,675 0 11 | 1868.....£45,675 0 11 |
| 1868.....£45,675 0 11 | 1869.....£45,675 0 11 |
| 1869.....£45,675 0 11 | 1870.....£45,675 0 11 |

LIFE BUSINESS.

The Directors desire to call the especial attention of the Proprietors to the statements of the Life Branch of the establishment.

The Actuary's Report on this subject has been accompanied by an appendix, containing the full particulars of investigation made, and is illustrated by two coloured diagrams, which may plan the future progress of the mortality experienced by the Royal, as indicated by colour lines, which contrast most favourably with the former averages of mortality, also depicted on the diagrams.

It is expected that these disclosures will attract a deep and profitable attention to the future management of the Company, and that the results of them will have hitherto given no basis to its principles and advantages, and it is evident that this Company, so well as others, will be able to secure the most favourable consequences to be anticipated.

The Bonus appropriated to the assured with participation amounts to 25 per cent. per annum, to be added to the original sum assured of every participating Policy effected previously to the 1st of January, 1851, and every future year. That it had been in existence since the first appropriation of Bonus there, and to one of the largest.

JOHN B. ROY, Manager and Actuary.

POLY M. JOHNSTON, Secretary to London Board.

Capital.....£200,000
Amount Guaranteed.....£100,000
Annual Income.....£10,000

The security thus afforded, and the advantages of moderate rates and liberal management.

No charges whatever are made beyond the premium.

For those who desire to provide for themselves in old age, sums may be secured payable on attaining a given age, or at death, or at death, if it occur previously.

Endowments for Children are made payable on attaining the age of 18, or at death, if it occur previously.

The Tables of Rates here given are of necessity very limited, but every information will be readily afforded on application.

HENRY B. DAVENPORT, Secy.

GOVERNMENT SECURITY LIFE POLICIES.

The only Life Policies dependent on Government Securities, and which entitle Insurers to withdraw at any time ON DEMAND nearly the Half of all Premiums paid, and are issued by the CONSOLS ASSURANCE ASSOCIATION, 10, Abchurch Lane, London, E.C. 4.

CONSOLS POLICIES CONTRASTED WITH ORDINARY POLICIES.

THE DIFFERENCE BETWEEN CONSOLS POLICIES AND THOSE OF OTHER COMPANIES IS THIS—

CONSOLS POLICIES.—Annual Current Values are Valued after deduction and under the security of Private Government Securities, which—

1. They are not available for withdrawal until the death of the Insured.

2. They are available and securities are not subject to fluctuations.

3. They do not entitle the Insured to withdraw anything, and most officers give as little as possible, as an order value, for these policies, while the non-payment of a premium by a stated day forfeits the policy, and all the premiums paid upon it.

These are some of the advantages offered to Insurers by the Consols system of Life Insurance, prepared by Dr. Fane, of the General Register Office, Somerset House.

The Association has been most successful in its career. A large sum of Capital has been subscribed by more than 100,000 insured highly respectable shareholders, and its principles of business are the basis of the system.

Interested Insurers, parties desirous of becoming Agents, and Investors of Capital, wishing to meet with an unusually safe and profitable investment, are invited to peruse the prospectus and other documents issued by the Association, to be obtained of any of the Agents of

THOMAS H. BAYLER, Managing Director.

40, Strand, London.

BANK OF DEPOSIT (Established A.D. 1844).

3, Pall-Mall East, London.—Capital £200,000.

Parties desirous of Investing Money are requested to examine the Prospectus, which will be sent on application, and interest may be obtained, with ample security.

Deposits made by special agreement may be withdrawn without notice.

The interest is payable in January and July.

PETER SEYMOUR, Managing Director.

Forms for opening accounts sent free on application.

ORNAMENTS for the DRAWING-ROOM.

LIBRARY, &c.—As an extension of ALBERT, MARBLE, BRONZE, and DRY-LEAF ORNAMENTS. Manufactured and Imported by J. TENNANT, 141, Strand, London, W.C.

GREENWICH AND WOOLWICH RAILWAY COMPANY.

CAPITAL—£200,000, in 200,000 Shares of £1 each. Deposits, &c. payable.

THE LONDON REVIEW

AND WEEKLY JOURNAL

CONDUCTED BY CHARLES MACKAY.

PUBLISHED EVERY SATURDAY MORNING. PRICE THREEPENCE.

Aims to supply a public want; to provide for the *Southern* of the Empire, a Weekly Journal, in which shall be embodied all Literature and Art, and in which topics of social and universal interest shall be treated with the fulsome only accorded in other journals to the struggles of party at home and the intrigues of diplomacy abroad. While its pages will afford a complete record of the events and opinions of the day, and while its articles on public affairs will appear in the highest order of taste in Politics and Literature, its conductors will strive to make it an independent and unbiassed medium of communication between the good taste and enlightened feelings of the Scotch, and the Social Empire, will, in its columns, compete with *Colliers* for the favour of the family circles to which it will address itself.

The "LONDON REVIEW" will contain no logic, allusion, or advertisement, that could render it an improper guest at the fireside; and the amusement and instruction of those who have but little sympathy with the necessities of party politics, and who look in a newspaper for something more than controversy, will be amply provided for.

The "LONDON REVIEW" is not a compilation from, or a reprint of, other newspapers, but a thoroughly original journal. It is printed on good paper, in a clear, bold type; and, in quantity of matter, greatly exceeds most of the more costly weekly newspapers; whilst its price is such as must secure for it a world-wide circulation.

THE "LONDON REVIEW" may be obtained through any of the following Provincial Booksellers and Newsagents:—

[illegible]

THE IMPROVED PATENT HARMONIUMS.

MANUFACTURED BY ALEXANDRE & SON, OF PARIS.

CHIEF WHOLESALE AGENTS: METZLER & CO.,

37, 38, & 35, GREAT MARLBOROUGH STREET, LONDON,—W.

ALEXANDRE'S HARMONIUMS are universally admitted to excel all others in durability, and in the power and quality of their tone; and as they rarely require tuning, and give no trouble in their management, they are coming daily into more general use.

The following is a complete List of all the Instruments manufactured by them, forming a large Assortment, suitable for either the Church, School, or Drawing-Room.

PRICES.

A large assortment of the above-named Instruments always on hand. N.B. No extra charge for packing.

TUTORS FOR THE HARMONIUM.

Engel's Complete Instructions (with or without Stops) ... 2s. 6d.
 Complete Instructions for the Drawing-Room Model ... 2s. 6d.
 Engel's Complete Instructions for the Drawing-Room Model ... 2s. 6d.
 Prehn's Method, containing a full explanation of the use of the different Stops, &c. ... 6s. 6d.
 And a variety of Harmonium Music by well-known Composers.

WITH THE PATENT PERCUSSION, OR PIANOFORTE HAMMER ACTION.

The invention of the PATENT PERCUSSION ACTION has entirely removed the sole objection to these admired instruments—want of articulation when used for Pianoforte Music. It consists of a set of Hammers which strike the Vibrators at the same moment that the air is admitted, thus facilitating the execution of the most brilliant and rapid passages, and also producing a fuller and very superior quality of tone, and imparting to this instrument all the advantages of the Pianoforte.

| | |
|--|-------------|
| No. 14.—In Rosewood Case, Three Stops, One Row of Vibrators | 25 Guineas. |
| No. 15.—In Rosewood Case, Five Stops, Two complete Rows of Vibrators | 30 |
| No. 16.—In Rosewood Case, Thirteen Stops, Four complete Rows of Vibrators | 60 |
| No. 17.—In Rosewood Case, Thirteen Stops, Four complete Rows of Vibrators, with 1-Octave of Pedals (separate Vibrators), with Bellows Handle | 80 |

METZLER & CO.

CASSELL'S ILLUSTRATED FAMILY BIBLE,

FROM GENESIS TO I. SAMUEL INCLUSIVE—FORMING THE FIRST VOLUME.

This Edition of the Holy Scriptures, in its aerial form, has not only attained an unprecedented circulation, but has been pronounced by the public press superior to anything of the kind ever issued.

The Text is that of the Authorized Version, which is faithfully adhered to throughout. The Marginal References are from the best Oxford editions of the Bible, with numerous additions. The Notes are purely explanatory, designed to give the deeper meaning of certain words and phrases, to reconcile apparent discrepancies, and to illustrate images and allusions in the Sacred Text.

by a reference to the Manners, Customs, Laws, and Religious Rites of the Eastern World. This volume is embellished with upwards of 300 ENGRAVINGS, All of which are the productions of eminent artists, and executed in the best possible manner. In addition to these Historical Compositions, the Notes are also profusely embellished with Engravings, including Antiquities illustrative of Manners and Customs, views of Places and Buildings mentioned in the Text, Animals, Plants, Trees, Minerals, Maps, Plans, &c.

PRICES.

| Elegantly Bound in Cloth, bevelled boards, red edges, gilt back and sides | - | - | - | - | - | 9s. 0d. |

This Work is also Published in Weekly Numbers, price 1d.; in Monthly Parts, price 5d. and 6d.; Quarterly Sections, 1s. 3d.; and in Half-Yearly Divisions, 2s. 6d.

Plain Cloth Case, for Binding, price 2s.; Neat Cloth, gilt back, 2s. 6d.; Handsome Cloth, gilt back and sides, 3s.; Ditto, bevelled boards, do. 4s.

OPINIONS OF THE PRESS.

"The first volume of this truly national work now lies before us, and it would be difficult to conceive of anything in our modern literature and art to be compared with it. Whether we refer to its literary, artistic, or mechanical execution, it is a work of unparalleled interest. To ministers, students, and Sunday-school teachers, it will be found of invaluable service; while to the myriads of England's people it is a positive boon. Neither hall, nor house, nor cottage should be without this Bible."—*Exeter*.

"We are so rejoiced as we are astonished to hear of the enormous circulation that this Edition of the Holy Scriptures has attained, both in this country and in the United States. Yet, why should we be astonished? The type is luminous, the printing and general getting up all that could be desired, the notes useful, the marginal references complete, and the illustrations numerous and superior! Finally, it is a miracle of cheapness."—*The Patriot*.

"The type is large and clear, the references are sufficiently ample, the illustrations are excellent, and the notes are very full and useful. It is a noble undertaking."—*Morning Herald*.

"Not only is it furnished with copious historical and descriptive foot-notes, and references to parallel passages, but it is embellished with a series of engravings, unpercolated in number, in beauty of design, and in artistic finish."—*Daily Telegraph*.

"We are at a loss what to make of this volume. We have hitherto met with nothing like it. . . . It is absolutely loaded with illustrations. . . . The type is

excellent; the references are copious and select; the notes invaluable. When the whole shall have been finished it will exhibit an edition of the Sacred Scriptures, of matchless splendour; and the terms on which it is issued are such as to bring it within the reach, even of the lodge and the ditcher, the shepherd and the ploughman."—*British Standard*.

"The type is good. . . . The notes give much information on archæology and Orientalism. The illustrations, taken from ancient monuments, and the like, are valuable for a similar reason."—*The Bell*.

"We have seen no Family Bible at all comparable to it for the amount of information reflected on the text of the Divine page, by comment and illustration."—*Dorchester Protestant*.

"Altogether, the work, whether regarded with respect to typographical excellence, the copiousness and completeness of the annotations, the number and quality of the illustrations, or its extreme cheapness, is a marvel."—*W. of Bristol*.

"This is one of the marvels of modern illustrated literature, and will, when completed, be a monument of the enterprise and spirit of the publishers. The illustrations are of the highest class, and adorn almost every page. No incident in Bible History, which can be pictorially delineated, is left untouched, and both in drawing and in engraving, the specimens are perfect."—*Belifist News Letter*.

"A marvel of excellence in paper, print, and illustration."—*Published Circular*.

CASSELL'S POPULAR NATURAL HISTORY,

ILLUSTRATED WITH 500 ENGRAVINGS, AND 13 TINTED PLATES.

Vol. I., elegantly bound in cloth, price 8s. 6d.

CONTENTS.—I. FOUR-HANDED ANIMALS, including the whole of the Monkey Tribe; II. WINGED-ANIMALS, including the Bat, the Vampire, and numerous other curious varieties; III. INSECT-EATING ANIMALS, comprising the Hedgehog, Tenrec, Shrew, Musk Rat, Mole, &c.; IV. ROBBERY, or GRABING

ANIMALS, as the Hare, Rabbit, Squirrel, Marmot, Porcupine, Beaver, Moose, Rat, and numerous others; V. FLESH-EATING ANIMALS, including Bears, the Racoon, Civet, Zibet, &c. &c.

Sold also in Monthly Parts, price 6d.

OPINIONS OF THE PRESS.

"The book is a very handsome one, is well printed, and fit to be an ornament to the drawing-room table, as well as of utility to the juvenile student of that delightful science, Natural History."—*Morning Star*.

"The lovers of Natural History cannot possibly select a work calculated to afford them more instruction or amusement."—*Daily Chronicle*.

"The information is given in a manner which inspires the reader with perfect trust in its scientific accuracy. . . . No work on Natural History of such completeness has ever yet been brought within the same compass and price."—*West's Literary Advertiser*.

"We cannot appreciate or commend too highly the volume before us, which both from its classification of details, sequence of argument, and general mode of treating the subject, is eminently calculated to facilitate the inquiries of the student, and bids fair to become one of the most popular books of its kind."—*Literary Gazette*.

"It is size and elegance render it suitable for the drawing-room; the masterly character of the contents adapt it for the study."—*Cont Circular*.

"An instructive and entertaining work."—*Daily News*.

CASSELL'S HAND-BOOKS,

12mo. cloth, 1s. each.

Under this title it is intended to issue a series of thoroughly useful works, on various subjects, all of which will be treated in an elementary and popular manner, so as to meet the wants of those who wish to obtain the best information in a condensed form. The following are now ready:—

HAND-BOOK OF BOOK-KEEPING, by Single and Double Entry. Ruled Account Books to ditto, extra, 1s. 6d. each set.

"In this 'Hand-book of Book-keeping,' the principles of this science are exhibited in a concise and simple form, and by practical examples, in lieu of more abstract rules, which too often tend to confuse the learner."—*Daily News*.

HAND-BOOK OF CHESS, containing a clear exposition of the Game; Laws of Chess; Technical Terms; Advice to Young Players, &c.; with an account of the different Openings and Endings of Games, &c. By an OXFORD AMATEUR.

"In this small volume is contained the substance of the bulky works of Staunton, Philidor, and other chess authorities."—*Belifist News Letter*.

"The author has managed his subject with no little ability."—*Illustrated News of the World*.

HAND-BOOK OF BUSINESS; a Dictionary of the Terms and Technicalities used in Commerce, and Tables of Foreign Monies, Weights, and Measures.

HAND-BOOK OF ETIQUETTE, being a complete Guide to the usages of Polite Society.

In preparation.

HAND-BOOK OF GARDENING. By G. GLENY.

HAND-BOOK OF LETTER WRITING, with Hints on Composition and Style.

HAND-BOOK OF THE CIVIL SERVICE, being a complete Guide to the Examinations for the Appointments to the various Departments in the Civil Service.

HAND-BOOK OF THE PUBLIC FUNDS: a Guide to Investments.

CASSELL, PETER, & GALPIN, LONDON AND NEW YORK.

LONDON.—Printed by WILLIAM LUTY, at the Printing Office of Cox & Wyman, 21 & 23, Great Queen-street, Lincoln's Inn Fields, in the Parish of St. Giles-in-the-Fields; and published by the said WILLIAM LUTY, at the Office of "THE LONDON REVIEW," No. 11, Southampton-street, Strand, in the Parish of St. Paul, Covent Garden, both in the County of Middlesex.—SATURDAY, SEPTEMBER 8, 1860.

THE LONDON REVIEW

AND WEEKLY JOURNAL

Of Politics, Literature, Art, & Society.

CONDUCTED BY CHARLES MACKAY.

No. 11.]

SATURDAY, SEPTEMBER 15, 1860.

[PRICE 3d.]

GARIBALDI:—KING OF MEN.

GARIBALDI—first man in Europe for patriotism and honesty—is now the first in fortune. He towers above all his contemporaries. Kings and Emperors, the Pope and the Kaiser, stand on a platform far beneath him. Even he, the other great man of our day, on whose fate peace and war have no long depended, is relegated into a secondary position by the successful daring, and the no less successful straightforwardness of Joseph Garibaldi. The world would be a much better world than it is, if simple virtue were always as triumphant, and self-seeking ambition as signally defeated.

The entry of Garibaldi into Naples, considered merely by itself, and without reference to its ulterior consequences, is one of the most remarkable events in history. Conqueror of the minds and hearts of his countrymen, he disarmed both moral and physical opposition, and effected the downfall of the most odious tyranny that ever oppressed and degraded a people, by the very minimum of bloodshed. Never was a mighty revolution accomplished at so slight a cost. The accident to an excursion train last week, at Manchester, was attended with more suffering and loss of life and limb than the liberation of the Neapolitan kingdom. As for the perverse young man—the bad son of a bad sire—who has taken refuge in Gaeta, he has already ceased to interest the world. If he will but quietly take his departure to Madrid or Vienna—whither no one will be foolish enough to prevent him from going,—he will end his career by an act of wisdom of which no other portion of his life or reign has exhibited a symptom.

But it is only when people consider the next move in this mighty game that they can truly estimate the significance of Garibaldi's last achievement. Victor Emmanuel is king, *de facto*, of North and of South Italy. When is he to be king of all Italy? That also depends, in the first place, upon Garibaldi and Victor Emmanuel; and in the second, upon the Emperor of the French. Why should two such great men as Garibaldi and the Emperor Napoleon oppose each other? Napoleon III. ought to be convinced by this time that, as regards Italy, Garibaldi is stronger than he; and that if he do not coalesce and work with the master-mind, the laurels of Magenta and Solferino—green and fresh as they are—may yet be tarnished. The Emperor declared, little more than a year ago, that France went to war for an "idea." The idea was a great one; it was no less than "the liberation of Italy from the Alps to the Adriatic." But the work was too mighty for the hands which undertook to accomplish it. The Emperor, even were his motives as pure as those of Garibaldi, fell short of success. He miscalculated his means, and made no allowance for the natural jealousies of Europe, that saw in his quarrel with Austria a recommencement of those wars of conquest and unsolicited "glory" which made the first Napoleon the scourge and the pest of the Continent. The consequence was, that he excited hostilities where he did not reckon upon them, and found himself, after a succession of victories, before the famous Quadrilateral, in a position where great Victory was likely to be followed by greater Defeat. He therefore drew back while it was yet time, and while the glories of Solferino were fresh upon his brow, leaving his splendid promise unfulfilled, and having freed no part of Italy but Lombardy, which he transferred to Sardinia, and the Duchies which presumed to dispose of themselves without his concurrence.

But Garibaldi had also his idea for the "liberation of Italy from the Alps to the Adriatic,"—an idea which he had conceived, and for which he had struggled and bled years before it entered into the mind of his tardy competitor. If the Emperor not only retired from his self-imposed task, but chose to thwart the projects of his former ally—the King of Sardinia, Garibaldi was not to be turned from the straight line. There was no crookedness in his politics, no bargaining, overtly or covertly, for any gain to himself; no hidden project for the advantage of anyone else; nothing but the unity and the freedom of Italy,—to be accomplished by him, not for him. Such a man, fighting for such a cause, excited no jealousies among the nations. He may have alarmed bad kings and emperors; but the people of all Europe were with him. And not alone the people, but one Government,—and that the greatest and most powerful of all—the free Government of Great Britain sent him moral aid, while the people sent not only their moral support, but men, money, and ships. The result, so far, has proved that Garibaldi, and not the Emperor of the French, was the right man for the work. Napoleon III., who thinks much and says little, ought to be convinced of the fact. The force of circumstance has made it palpable to the rest of the world; and it would be doing an injustice to his intellect to believe that he can be insensible to a truth so notorious.

The next movement of Garibaldi must be upon Rome, and his next work the overthrow of the temporal power of the Pope. Already Umbria, the Marches, and the whole of the Legations are in arms to support their deliverer, and not all the genius and ferocity of General Lamoricière, the hired cut-throat of the Papacy, can avert the catastrophe—unless the Emperor of the French should be traitor enough to Italy to declare against Garibaldi. Victor Emmanuel has, by his promptitude, rendered it difficult, if not impossible, for the Emperor so to act. He has sent his legions into Umbria and the Marches to establish civil order, and to give the people the liberty of deciding their future destinies. These facts are so strong as to compel Napoleon III., the mighty master of many legions, to reflect that the revolutions of Rome are once again brought back almost to the very point at which they stood when the President of the French Republic sent a fratricidal army against this same Garibaldi. Thus meditating, he will probably come to the conclusion that the Italian policy of France, ever since 1848, has been hopelessly wrong.

That France, which had just banished her own sovereign, declared her own freedom, and established a Republic, should interfere by force of arms to prevent the people of Rome and the Legations from doing the same, was a monstrous outrage, which, though not originated by Napoleon III., was acquiesced in and continued by him, and to all the odium of which he is therefore amenable. Had it not been for France, Italy might have wrought out her own freedom eleven years ago. And the events now occurring are more than sufficient to show that the military occupation of Rome by a French army in 1849, merely retarded by a few years, but did not prevent the downfall of the Papacy as a temporal power. France, no doubt, put back the hands upon the great dial of Revolution, but France did not and could not stop the clock. The Roman question has ever since continued to tick; and the bell of the great clock of Fate is about to sound the doom of the Papacy—unless the Emperor shall again interfere, as unwisely as before, to postpone a catastrophe which he cannot prevent. He told the people of Marseilles on Monday last, that "the desire for all that is good, the enthusiasm for all that is

noble, cannot abate in our day;" and added, "that the works of peace were, in his eyes, crowns as beautiful as those of laurels." If he will work out this beautiful sentiment with regard to Italy, as well as with regard to France, and allow the Italians to be arbiters of their own destinies, without his interference, or that of his armies at Rome or elsewhere, he will greatly help to secure the tranquillity which he truly declares to be the wish of the world. The Papacy is doomed; and if the Emperor will but admit the fact, and offer the Pope his old lodgings at Avignon—or plant him in Jerusalem—the peace which every one desires will be more of a fact, and less of an aspiration, than it has been at any time since 1848.

The question of Venetia is not yet ripe. Austria will not expedite its solution by interference in support of the Pope. She has other work on hand to try her mettle. And we may be sure, were she so ill advised as to attempt for *Pis IX.* that which she did not attempt for her unfortunate brother at Naples, that Hungary would immediately create a diversion, which would free Venetia as well as Rome.

"HANDS OFF!"—Let this be the counsel of England and the determination of France, and Italy, under the guidance of Garibaldi and Victor Emmanuel, will soon be free from the Alps to the Adriatic. And, if it be not the determination of France, war will devastate Europe a few years longer; but the result will be the same. After what has happened within the last twelvemonth, the further degradation of Italy, by King, Pope, or Emperor, is simply impossible.

THE DISCOMFORTS OF ROYALTY.

WE believe that it was either the philosophic Frederic of Prussia or the still more philosophic Joseph of Austria who said that his trade was that of a king, and that it was not a satisfactory one. All trades and professions have their grievances; and the trade of kingship is no more exempt than others. The omnibus driver, the cabman, the journeyman baker, the postman, the policeman, the attorney, the author, the statesman, and a thousand others, have each and all their personal discomforts, inseparable from their business;—and why not kings and queens? There is a compensation in all the affairs of this world. Much money, much care; much responsibility, much anxiety; high station, high peril. It is no doubt a fine thing to be an Emperor,—to be at the head of a noble army,—to have an unlimited command of money, and of men's defence; but there is a tremendous *per contra* to all this magnificence and power. Jones, the banker's clerk, with two hundred a year, or less, is a poor fellow, no doubt; but he is not compelled to have a taster to make sure that his food is not poisoned; he is not obliged to wear a coat of mail, ball-proof, under his cotton or linen shirt; he does not get in daily fear of infernal machines at street corners when he goes to the play or the opera; he does not dread the inclemency of the seasons, lest famine should lead to Revolution, and Revolution to his exile or death, and the ruin of his family and friends. But a great Emperor is not so fortunate; and has to do battle for his high position by a myriad of struggles which few can appreciate, and still fewer understand. It is no easy work to be Emperor of Austria, of Russia, or of France, at the present day. It is no easy thing to be Pontifex in Montenegro, Pope in Rome, or Sultan in Turkey; but, on the contrary, a very harassing, uncertain, heart-breaking kind of business.

Even in our own happier realm of Great Britain it must be no small nuisance to be a Queen, or even a Prince Consort. It is true, there are no fears of revolution, or even of any considerable change, in our isles, for a whole generation at the least; but queenship or kingship, though it glitters, is not, after all, so very golden as it appears. To be removed from human sympathy is no small evil. Not to know, and not to be able to discover whether a man is your friend, your sympathiser, is a very considerable disquietude. To be always beset and clouded by formalities and ceremonials is at best but a splendid kind of slavery. To have GOLD-STICK here, and GOLD-STICK there; to have a Lord Chamberlain, a Lord Steward, a Mistress of the Robes, and a Groom of the Stole, Lords and Ladies in Waiting (read *Lords and Ladies* doing the duty of footmen and chambermaids), at every turn of your house and your household; to see great statesmen, the ablest and most illustrious men of your realm, lacking out of your presence, lest they should affront your majestic eyes by the sight of their coat-tails; to live in an atmosphere of continual sham, stilt, hypocrisy, ceremonial flattery and lies, is surely a sore trial to a genuine human being, whether male or female. The royalty of England is clouded in this kind of straight-jacket to an extent of which few but philosophic ministers of state, subjected to its weary influence, can have any idea. And it is therefore pleasant to see that our excellent Sovereign and her Royal Consort are glad, as often as possible, to escape from the thrall of the *etiquette* that would squeeze all the human nature out of them, if it were allowed to have its own way. No sane man would consent to be a king, if he were obliged to sleep every night with a hard and sharp golden crown upon his head. The Queen and the Prince are evidently of this opinion, or the little escapade of their journey to Grantown

on the Spey has no meaning. "On Tuesday forenoon" (last week), says the *Inverness Courier*,—

"A gentleman drove to the door of the comfortable inn or hotel known as the 'Grant's Arms,' in the centre of the open square which constitutes the village of Grantown, the capital of Strathpey. He obtained audience of the lady, Mrs. Glas, and said he wished to engage the whole house that night for a *seriously-married couple* and their suite. The worthy hostess demurred, as she might thus exclude some of her best customers; but the applicant was very civil as well as urgent, and gave assurance that the party were '*highly respectable*.' There was no difference as to terms, and Mrs. Glas was told that she would be glad afterwards to know that she had stretched a point to accommodate the party. In those circumstances an arrangement was come to. The principals arrived in the evening—apparently very quiet, satisfied with everything and everybody about them. Next morning, at ten o'clock, the carriages were at the door, and the strangers took their seats. All being ready to start, Mrs. Glas was called for, and Lord Churchill complimented her on the cleanliness and order of her establishment. The strangers, he said, had been very comfortable, and the lady said she had never slept more soundly in her life. 'I may now inform you,' said his lordship, as the principal carriage drove away, 'that you have been entertaining Her Most Gracious Majesty the Queen, and Prince Consort.'"

We need not tell any more of the story, or repeat any of the sillinesses of the Grantown correspondent of our respected cotemporary, who declares that the days of this unexpected visit "are henceforth to be red-letter days in the calendar of Strathpey." All we have to do is, to express our hope that the royal pair will find or make many future opportunities of escaping from the infernal of Gold-stick, and all the other sticks that combine to render them uncomfortable, and to enjoy themselves as Mr. and Mrs. Jones, or Mr. and Mrs. Brown might do, in their annual holiday. To be at peace, and unobscured by spies and toudies, in a Highland inn, with good appetites, good health, clear consciences, and a sufficient purse to pay all charges, is a treat that even Royalty itself cannot procure without some difficulty. The little perversion of the truth, in the statement of the Lord in Waiting, that the mysterious guests of Mrs. Glas were a newly-married couple, is pardonable, for the sake of the complacent to matrimony which it involves in the case of a grandmother and grandfather.

The moral of the story is simply this,—and it is one for the humbler classes, who complain of hardship, to take to their hearts:—Hardship is not confined to the lowly. The loftiest find it pleasant, as well as wholesome, to descend to the ordinary level of humanity, to rough it—to shift for themselves—and to be considered, by those about them, if only for once in a way, in the light of common human beings.

A PERVERSE POLITICAL ECONOMIST.

IT is now nearly forty years since Mr. Huskisson denounced in Parliament the practice which had prevailed during the Great War, when a large and increasing revenue was essential to national safety, of examining the list of imports, and taxing every one which promised to yield a revenue. In consequence almost everything imported was then subjected to customs duties. They culminated between four and five hundred articles, and involved an immense mass of legislation. The system was so expensive and vexatious, it interfered so much with our growing trade, that it was necessary to alter it; and from that period till the late Session of Parliament, when the duties on a great number of small articles, till then left in the tariff, were repealed, the policy of diminishing customs duties has been necessarily followed. It was one of Sir Robert Peel's great achievements to remove from the statute-book many such duties and many vexatious laws; and it is one of Mr. Gladstone's merits, that in the late Session he substantially completed the work his predecessor had begun.

Mr. McCulloch, however, has recently informed us that this policy, which has been accompanied by remarkable and continually increasing prosperity, which has been held up to general admiration, and been in many other countries advantageously imitated, "has in truth been pushed to an injurious extreme." "Instead of shortening the list of articles subject to excise and customs duties," he says "we should have taken every opportunity of lengthening it," "which would have added to the breadth and stability of our customs system." "No article," Mr. McCulloch thinks, "unless it be the raw material of a manufacture, should be allowed to be imported, except under a duty of 10, 12, or 15 per cent." He, accordingly, objects to the repeal, in the late Session, of the duties on butter and cheese, though they were discriminating and protective, conferring an advantage on our colonies as against foreigners, and on our dairy-keepers as against the consumer, because the repeal sacrifices revenue without any corresponding advantage. He objects equally to the reduction of duties on fine wines, silks, gloves, bronzes, &c., because it relieves the luxuries of the rich, "while we continue to impose heavy duties on the tea and sugar which are indispensable to the labouring poor, and on the tobacco, the spirits, and the beer, which constitute their luxuries." The proposed repeal of the paper duties is also stigmatised as, under present circumstances, "inconscient alike with principle and common sense." Whether the duties be customs or

* Supplement to the Commercial Dictionary, just published.

excise, levied on necessities or on luxuries, protective and discriminative, or merely duties for revenue, the repeal or reduction—no trade a sinner at those who know little of the “principles of free trade they invoke,”—is condemned in strong terms by Mr. McCulloch.

Is the policy, then, which Sir Robert Peel shattered his own great party to carry out, which, till now, no man of authority has attempted to check or improve, which has made us more than ever the guide of other nations, a perfect failure? Is Mr. McCulloch's political economy perverse? The question involves not merely the reputation of individuals, but the policy of civilized nations; and being started must be elucidated and decided, or we shall fall into mental confusion.

Mr. McCulloch, finding the general principles he formerly inculcated at variance with his present conclusions, derides their authority, and for the sake of his new theory saps the foundation of all knowledge and all reasoning. With the spirit of scepticism, which can last momentarily predominant in him, he says there are but “a few absolute principles, either in political economy or in anything else. Even the Divine command, ‘Thou shalt not kill,’ is not to be obeyed at all times and under all circumstances.” The fact, however, that we do not always obey the Divine command, does not lessen its absolute validity. Even when we go to war, or put a criminal to death, we always regret and deplore the presumed necessity for our acknowledged disobedience. The principle, then, is valid at all times, and under all circumstances. We may assert the same of every other well-established moral principle. Honesty is universally found to be the best and the only policy; unrestricted competition or freedom for honest industry admits of no exception; and to encourage men to disregard such principles, and to follow the suggestions of their own imaginations, or the devices of their own hearts, in order to promote the public good, is to prefer the fancies of each individual to the aggregate experience of mankind. Mr. McCulloch can only escape the difficulties he has rashly plunged into from motives more apparent than praiseworthy, by denying the general principles to the advocacy of which he owes his reputation.

His scepticism having no good foundation, his objections, in detail, will not bear examination. “The average price of foreign butter in England, *ex duty*, varies, he says, from £1 to £5 a cwt., so that the duty of 5s. could have no material influence over its amount; and no individual will in fact derive any appreciable advantage from a measure that entails a loss of above £100,000 a year of revenue.” At present the price of foreign butter of different qualities varies much more than Mr. McCulloch says. At the same time 5s. per cwt. is 6 per cent. on the price of 80s., which is ample to permit the butter merchant, if wholly interfered with by the Customs House, to import much inferior butter from the United States, Holland, Hessein, and the neighbouring parts of the continent of Europe. In fact, since the duties were repealed butter has been brought from France, Prussia, and the United States, whence it did not come before.

In the seven months of the present year of which we have the official accounts, the butter imported was 388,205 cwt. against 230,803 cwt., in the same period in 1859, and 233,935 cwt. in 1858; or, in seven months, the repeal of the duty having been only five months in operation, the quantity imported has increased 67 per cent. over the average quantity imported in the two previous years. The unfavourable season has told on the price of provisions, and butter has ruled high, “owing to the lack of herbage and the scarcity of provender.” In the week ended March 17, “fine Friesland butter sold for 12s. per cwt.,” but then the remission of the duty had just taken place, and in consequence there was soon an “immense supply of foreign butter in the market.” In May, accordingly, the price of Friesland butter was down to 10s., and then rose to 11s.; notwithstanding large imports in consequence of the unfavourable weather, both here and on the continent. Had the duties not been repealed, the price would have been enormous, we are told by those best acquainted with the trade. Afterwards it again fell, in consequence of large arrivals. The slightest inspection of the weekly market reports of the *Economist*—from which we have taken most of these minute particulars—or any other journal, would have kept Mr. McCulloch from making the incorrect assertion we have quoted. These facts prove that both the butter merchant and the consumer have already found a very “appreciable” advantage in the repeal of the butter duties. The trade of the former was much limited and hampered by the duties; and though the consumer, in consequence of the season, has not yet reaped all the advantages of unrestricted competition, there can be no question that he is already, and will be hereafter much more, benefited by the repeal of the duty on butter. Even now, we are informed that good foreign butter can be sold retail for 10d. per lb., though the retail dealers have not yet given the consumer the full benefit of the increased supplies.

Similar remarks and similar facts apply to cheese, the repeal of the duties on that being equally condemned by Mr. McCulloch. The quantity imported in seven months was—in 1858, 189,862 cwt.; in 1859, 183,478 cwt.; and in 1860, 221,312 cwt. The increase in 1860, therefore, over the average of the two preceding years, was nearly 20 per

cent. But as more time is required to prepare cheese than butter for a foreign market, by and by, no doubt, the cheese imported will increase in as great a proportion as the butter. In July, 1860, the quantity imported was 40 per cent. greater than the average quantity imported in July, 1859 and 1858. Butter and cheese, next to bread and meat, are the sustenance of the labouring classes; and the repeal of the duties on these articles, quite contrary to Mr. McCulloch's assertion, has already conferred great benefits on them, and permitted the extension of the butter and cheese trade.

Mr. McCulloch is in error, then, as to details, and he contradicts the principles of his science. He places himself on a level with Mr. Ruskin. The source of his mistake is obvious. Apart from a peculiar veneration for Sir Robert Peel, which induces him to stop exactly at the point to which Sir Robert advanced, and apart from a very different sentiment he entertains for Mr. Gladstone and Mr. Cobden, he exalts the state above the nation, government above the people, revenue above trade, and demands the sacrifice of the latter for the sake of the former. He forgets that, as the nation flourishes, it supplies enlarged means of taxation, and strengthens the state. Disavowing general principles, he has nothing to guide him but his own fancy of what “conduces to the *adus populi*,” and he imitates those ignorant politicians who, to attain this end, established the now derided “commercial system,”—the Corn and the Navigation Laws. He would multiply, to an indefinite extent, in opposition to all experience, customs and excise duties, and restrictions equally obnoxious, both from their origin and their present effects. We grieve to see so eminent a writer justifying, by his own perverse assertions, and by applying his science to such an improper object, the objections of sentimental sneers. The present Supplement seems, like Lord Overstone's harangue, chiefly intended to attack the commercial treaty with France and Mr. Gladstone's budget; and seems dictated by motives very different from sanity, to which we have heaped his strange assertions in favour of customs and excise duties ascribed.

MUSCULARITY.

It is not long since a popular, if not a large school of theology acquired one of those characteristic nicknames which now and then become fashionable, and live in men's mouths by reason of their appropriateness. The phrase “muscular Christianity,” however, was never *soubriquet* flung at random, and adorning by accident; it was rather an intuitive recognition of truths which the popular mind had been long striving definitely to connect with the current theology; the culmination—quaintly named—of a system of ethics for the reception of which the circumstances of our time had prepared public feeling. Throughout the whole range of modern English interests there has existed for the last ten or fifteen years an increasing enthusiasm for everything recommended by healthful bodily training and development. Our pleasures have been taught to partake more of the character of healthful exercises. Pedestrian tours, and rowing-trips have become common. Increased attention has been paid in our homes to the rules of sanitary science; while the reception accorded to such publications as Miss Nightingale's recent “Notes on Nursing” proved in another way the spreading belief in the importance fairly attaching to the things of the body.

Natural science, once the stronghold of imposture and empiricism, has come under the influence of this feeling. A new race of inquirers has sprung up; men eager to know, persistent and daring in their pursuit of information, and gaining recruits yearly from among persons of energy and intelligence, who, even for the first time, see scientific employment as a field wherein to spend their mental and physical powers with real benefit to themselves and others. Thus it happens that we can at this moment look with pride along the well-filled ranks of our philosophic advanced guard, and congratulate ourselves on the possession of such a corps, well officered, numerous, and well drilled,—perhaps the hardiest and healthiest body of thinkers and workers in the world. And to this importation of muscularity into science we owe many of its most important results. It were useless for any but a physically robust man to dream of establishing the theories of a Lyell or a Forbes, requiring as they do, not merely the brain to conceive, but the bodily strength requisite to collect the facts which furnish their foundations. It is to the hardy training and voluntary hard work of such men as Piazzi Smith that we owe many a precious astronomical and meteorological truth.

To live and work daily some ten thousand feet above the sea-level, to endure contentedly and cheerfully the necessary hardships of this mountain life, and to depend, for the attainment of all he seeks to discover, on vigour of body and strength of mind,—this surely is to be a muscular philosopher. Our Alpine explorers are no less admirable examples of this class of men. Living for long periods in the immediate presence of dangers which challenge fortitude and resolution, the Tyndalls of to-day, patiently pursuing investigations in localities where chamois hunters only might be expected to incur the risk of broken bones, are good types of the muscular philosopher.

In the geologist's rambles, however, on the Peak of Teneriffe, or among the glaciers of the Alps, we can readily imagine much of the pleasure, if some of the toilsome side of inquiry; but unalloyed endurance of real and severe suffering is only less common by reason of its being less needed. The Arctic voyager, sitting on "term" day within the hut erected for that shelter without which life were scarcely possible, and with chronometer and needle for his sole companions, observing magnetic changes through the long, chess-board hours, seems to us to be a poet in which the combination of research with physical strength and courage reaches its highest development.

The causes which have operated to produce this change in the habits and organization of two schools of philosophy, separated from each other by a comparatively short interval, are sufficiently simple. During the last great European war, in which this country was so deeply involved, the development of physical strength became an absolute necessity. Our grandfathers, therefore, whose very existence depended on their courage and bodily vigour, received that hard but wholesome training to which we owe our national independence: the whole genius of the people was directed to fighting, and preparing for fighting; and those civilizing arts in which we at present hold so high a place were neglected or forgotten. The long peace which followed wrought many changes, and among these none were more important than the direction into new channels of enterprise and inquiry of those energies which had hitherto been expended on war. Many a sword was thus beaten into a pruning hook, and many a strongman turned to quiet study the skill and courage which, under other circumstances, might have led armies and won victories. After this long repose, the danger resulting from the revolution of the continent has once more driven us to arms. The personal health and strength, and muscularity of the citizens, have again become a national necessity; but it is within our power and intention now, as it was not within that of our fathers, to exhibit to the world the spectacle of a nation fully armed, yet as fully civilized, as physically strong, as they were, but mentally more robust and hardy. A chance is given us to realize, on the grandest scale ever yet attempted, the combination of a national "corpus sanum" with a "mens sana"; and this we may do by becoming a people determined that, under all or any circumstances, the lessons of past years of peace shall not be thrown away; that our muscularity shall not be tainted by any return to a hygienic brutality, but that, since we have found it wise and right to pay a greatly increased amount of attention to the development and improvement of our bodily powers, we will take care that while becoming muscular, our muscularity shall at least be scientific and Christian. And since, as seems probable, the natural sciences are destined shortly to become one of the great educational agents of our day, it is no slight subject for congratulation that we possess a school so capable of imparting a training admirably compounded of the physical and mental elements. One of the puzzles of the present day is to know how to give to our youth the advantages of out-door sports without their accompanying evils. The great majority of pastimes (cricket and boxing excepted) are mixed up far too much with petty vices. Here, however, occurs a very generally applicable solution of the difficulty named, for science, by becoming robust, becomes also a ready and unexceptional means by which we may hope with greater certainty to insure the healthy body and the healthful mind. Nor are strong limbs the sole physical advantage to be gained in geological or botanical rambles: the same studies which incidentally develop bodily strength tend, perhaps more than any other education, except that of actual campaigning, to produce in the student those habits of quick and comprehensive observation which, though bred only of peaceful work, and nurtured on nothing more warlike than the sights and sounds of moorland or seashore, might yet prove to be not one of the least valuable acquisitions for an English Volunteer, and probably capable of doing good service, if ever the work of real warfare were at hand. If, as the chief founder of the muscular theology tells us, the perfect naturalist should, beside his intellectual endowment, be "strong in body, able to climb a rock, turn a boulder, walk all day uncertain where he shall eat or sleep, ready to face wind and frost, and to eat or drink thankfully anything, however coarse or meagre; able to pull an oar, sail a boat, swim for his life, and ride the first horse which comes to hand; finally, a thoroughly good shot, and, if he go far abroad, ready on occasion to fight for his life;" then may Great Britain, in time of danger, find that, not only through muscular improvements in such things as ships and guns, but also by the increased strength and intelligence she can give to those who man them, the Science which has civilized can also guard her from the assaults of any and every opponent.

THE LATE MR. JAMES WILSON.

THE Indian Government has lost another of its ablest administrators. Before a fit successor to Sir Henry Ward, who ruled over Ceylon most successfully, has been found in the Government of Madras, a still more important officer—the Financial Secretary for India—has been removed from the scene of his labours. Mr. Wilson

died of cholera, at Calcutta, on the 11th of August, and his death may be considered a public calamity. He had not been more than ten months in India, and in that time had introduced a series of important financial measures, including an income tax and a system of paper currency, calculated to restore equilibrium between the revenue and the expenditure, to give strength to the Government, and prosperity to the people. His place will not easily be supplied. His measures are incomplete, and bearing on them the stamp of his peculiar mind, can scarcely be completed by another. At least it will be very difficult, if not impossible, for another to find the reasons by which his acute mind would have repelled objections and vindicated the principles of his measures. The Indian service has produced many eminent men, far better acquainted with India than he was, but there was none so well informed of all the details of finance, so well aware of the commercial bearings of every tax, and altogether so well fitted for the great post he occupied.

His career is eminently instructive. Born on the north side of the Tweed, but educated on the southern border, he first emerged into public notice in London as a partner in a hat manufactory in Southwark. Flooding trade was not suitable to his ambition, and he entered into extensive commercial speculations, which were not successful. He was expelled from the company, and he was not, as we are told, nor is it now necessary to inquire; suffice it to say that he struggled through them, and previous to accepting high office, paid all his creditors in full. To the public he is known as a political and commercial writer, and as a clever administrator; and in these characters we shall speak of him.

For him, as for many others, the Anti-Corn Law agitation was the path to eminence. His first publication was, we believe, a pamphlet on the Corn Laws, which did not excite public attention so much as the letters of "Diogenes," but was distinguished as being a collection of facts, massed in a compact form, bearing expressly on commerce, and illustrating, theoretically and statistically, the injurious effects of those laws. His writing was neither terse nor elegant, but it was convincing. It was replete with knowledge and careful thought, enforced by not a little reiteration. Written by a commercially-educated man, it found its way into the hands of similar men; and he soon became a conspicuous advocate of the views and projects of the Anti-Corn Law League, though never a member of that body.

These labours helped him to reputation, and led the way to his establishing, in 1843, a commercial and political newspaper. To this project the circumstances of the times were extremely favourable, and *The Economist* was a decided success. In its origin, financially, he had some distinguished support; but the reputation of the paper, as a commercial and political organ, was made by his almost unaided exertions. In it are to be found most of the papers on banking, on currency, on manufactures, and commerce, which he afterwards published in separate works. Throughout this period he was a perfectly free trader, and carried his views so far as frequently to say, in respect to commerce, that no other legislation was of the least use than the abolition of laws. Though he had a great respect for the views and policy of Sir Robert Peel, he opposed him, with great vigour, when, departing from free trade, that statesman tampered with commerce and banking; and was, perhaps, the most vigorous opponent of the Act of 1844. Of that Act Sir Charles Wood was a staunch supporter, and the conflict of opinion between the two may be traced in Mr. Wilson's measure as to the currency and banking in India, which was modified at the dictation of Sir Charles. The better informed subordinate was overruled by his prejudiced superior.

Mr. Wilson's success as editor and proprietor of *The Economist*, gave him the means of getting into Parliament. In 1847, by his own exertions, he was returned for Westbury. He might have been elected for more than one large commercial borough, but such a constituency would have hampered him. His progress was from that time certain, and rapid. He had acquired great reputation for his knowledge of commerce and finance. His talents made him extremely useful and acceptable to the liberal ministry, and in 1848 he was appointed, in Lord John Russell's administration, Secretary of the Board of Control. He quitted office in 1852 with his party, and with his party returned to place. On the dissolution of Parliament he was again returned for Westbury, and on the formation of the Coalition Ministry he was appointed Financial Secretary to the Treasury, which office he continued to hold under Lord Palmerston's as under Lord John Russell's chiefship.

In 1857 he was chosen for Devonport, having completely identified himself with the Government, and become the nominee of the Treasury. After the short second ministry of the Tories he did not return to the Treasury, but was appointed Financial Minister for India. His great labours in this arduous office,—his new scheme of finance, departing, as one part of it does, from the financial and commercial principles he formerly advocated, are well known to the public. They brought on him some disapprobation from his former friends in the cotton districts, and involved him in a contest with Sir C. Trevelyan, in which he obtained the honour of a triumph. At the height of fame and fortune he has been snatched away; and even his

rials and opponents will regret the loss which the Government and the nation have sustained of a skilful and painstaking administrator.

The knowledge of the right hon. gentleman was at once accurate and profound, though neither diffused nor comprehensive; the result of his own reflections rather than of much study of the theories and thoughts of others. Naturally acute, and endowed with a strong will, he saw with great clearness what would redound to his own advantage, and pursued it with unflinching consistency. He rose in the world, for he was of it and studied it. The commercial spirit which animated him at first, animated him to the end of his life; and he steadily pursued the path to wealth and power. Perhaps no real and thorough free trader,—no man convinced as Mr. Wilson was that all commercial legislation is an error, ever could consistently accept office under a Government which consistently violates this principle. But all governments are for those who share in it a matter of compromise; and he who would rise to its higher places, and has a firm resolve to get wealth and power, must submit to promote measures opposed to his own convictions.

Mr. Wilson—by imposing taxes on the cotton manufactures of England imported into India, and supporting in office many similar measures—only bowed to an inevitable necessity,—followed the general practice of the members of all political parties, and gave up his opinions for the honour and advantage of serving the state. We pronounce no verdict on the morality of this practice, and of its influence over the minds of those—the leaders of society—who habitually follow it. We only say that Mr. Wilson, in seeking power, did, as most politicians do, govern by his own convictions, and he pursued his course with an unswerving regard for his own interest. He was a very strong as well as a very acute man. He performed well an immense amount of official and mental labour. He was awake and at work when other men slept, and he was, in the usual sense of the term, eminently successful.

CAUSA TETERRIMA.

A POLITICAL woman is a portent which seldom bodes good to the country or the house in which she appears. The consummation of our delights, the mother of our sorrows, when she forgets the offices of gentleness for which she was created, when she usurps the place of man, exaggerates his faults and turns even his virtues into vices. In her, courage becomes ferocity, economy tends to parsimony, her anger is vindictiveness, and for her cruelty no name can be found. A man may tire of the abuse of power, like Charles V.; he may shortly, like Augustus, be made to say, "I have even forgiven a woman, when she has once overstepped her sex's limits, never." She was not formed for public scenes, other than the revel and the pageant; and when she forces herself upon them, even though she extort our admiration, we cannot resist an instinct of repugnance. Man's softer nature shrinks from a Maid of Saragossa as from a Catherine of Russia. We, in England, have only a legendary idea of the hatefulness of unsexed womanhood. The example of the sovereign who happily reigned over us leads us to doubt whether her sex can produce any less gentle than she. But the history of all times teaches us that when there is exceptional wickedness we must look for woman's hand. Woman made a fool of Solomon the Wise; the glory of the sage Justian is tarnished by the views of Theodora. Even the reign of Nero might have been paralleled in wickedness, had he not been illustrated by the atrocities of Agrippina. In the present week we have seen the throne of the Two Sicilies lost by the young king's subservience to his Austrian stepmother; and in another country we see female influence thwarting the designs of mercy.

It is now two years since the Prince Regent assumed the sceptre of Prussia, which his brother had long been incapable of wielding. It was expected that his accession to power would be followed by an amnesty to the hundreds of exiles whom the events of '48 had driven from their fatherland. The Prince enjoys credit in Germany for a manly honesty which has been seldom found in his race; and, for some months, little disappointment was felt at the delay of this act of grace. It was ascribed to motives of delicacy,—to the unwillingness to show haste in reversing the acts of the brother in whose name he governs. But two years have now gone by, and he has made no sign. We begin to ask if he assumed all the attributes of royalty but the right to pardon, or whether the praises of his friends indicate not what he is, but what they would wish him to be. Dr. Eichehoff, in a pamphlet which has just had the honour of seizure in Berlin, gives us an explanation of the dilemma, which there is too much reason to believe is not unlike the truth. He says that, before relaxing her clutch upon the sceptre, the queen exacted from the prince a promise that no amnesty should be granted so long as the king breathes. He vegetates utterly unconscious of all around him,—a living death,—no glories, no flashes of mercurial now; but the queen, poor heart, still clings to her pet greatness, and is resolved that her husband shall still live a king in the misery of thousands of his subjects. We hope that the story is not true, and shall be only too happy to contradict it, on sufficient authority.

REVIVAL OF THE OLYMPIC GAMES.

THE Olympic Games, discontinued for centuries, have been recently revived; here is strange news, indeed. It is well known that the ancient first began to recede from the Olympic Games 776 years before the Christian era, and that the computation by Olympiads ceased after the 364th, that is, in the year of our Lord 480. An account has been forwarded to us of the manner in which the classical games of antiquity were revived near Athens, under the auspices of the Government, and with the full approbation of the Attic community. In the old Olympic Games there were wrestling, running, leaping, boxing, and throwing quoits. These five games constituted what was called "the *Pentathlon*." But then wrestling and boxing were sometimes united for the purpose of discovering which was "the best man," in the *pancratium*, so designated as requiring the whole strength and vigour of the human body to be put forth in the contest. Under the denomination of "running" was included not merely a foot-race, but also a horse-race, as well as a race with chariots—the chariots in war being often used for the same purpose for which a charge with heavy dragons is now directed, *i.e.*, to break up and disperse compact masses of the enemy. At the revival, that is the modern, Olympic Games, there were no chariot-races, no boxing, no wrestling, no *pancratium*; but there were horse-races, foot-races, quail-throwing, spear-throwing, and popular sports. The largest prize was contributed by a committee of gentlemen in England, and in their honour was designated "The Weicko Prize." The letter from the British Ambassador at Athens, Sir Thomas Wyse, to Mr. W. P. Broderick, of March Woodstock, in Shropshire, states that this prize was assigned to "the best runner in the longest race." Sir T. Wyse adds, "the race afforded good sport, for the Greeks run well, and the prize was unanimously and warmly contested."

There were fourteen competitors in the race, and the name of the victor was Petros Veliouras, of Smyrna. We omit the names of the other modern *Nikeates*, who, more lucky in one respect than their ancient predecessors, were not only crowned with olive, but also carried away with them some substantial golden drachmas. The smallest prize in the modern Olympic Games was "a skin of wine." The game itself is called "ball-kick," revived in Greek into the euphonious name of "avokima," from *avokos*, in Latin, "ster"; in English, "a bludge." It is a Greek game, performed by jumping bare-footed, and remaining with one foot on a greased goal-stick, shewn and filled with wine, which the winner takes." There were five competitors at this game, and the *Olympian* on the occasion was a nimble-footed individual, rejoicing in the name of George Vassiliadis.

The ancient games were held near Olympia of Elis; but the fame and greatness of Olympia have long since vanished away; whilst Athens, where the revival occurs, is the city of chivalry, and its renown will continue as long as the literature of Greece is prized. It is not less the city of art and eloquence, of science, of poetry, and of philosophy, than city that has been the seat of all sorts of crimes, enormities, and novelties. Such is the character given of it in the "Deipnosophists," book ii., chap. 24:—

"The Athenians made Aristodemus, the Corinthian, who used to play ball with Alexander the Great, a freeman of their city, on account of his skill, and they erected a statue to him. And they have conferred all kinds of illustrious titles on much less important than Aristodemus which had any reference to amusement."

It is, then, amongst the devotees of such a people, and in Athens, beyond all other places, are fittingly revived the Olympic Games.

NONCONFORMISTS IN 1662.—One of the most cruel deeds in the reign of the worst of English kings was the expulsion of Protestant ministers from the Established Church, because they would not comply with the conditions of what was called "an Act of Uniformity." Not only were Protestant ministers expelled from their livings, curacies, and lectureships, but they were visited with fines, imprisonment, and banishment, "if they ventured to assemble for worship and the preaching of the Word." They who had sacrificed wealth, home, and family, for conscience' sake, were treated as criminals. The sufferings of those good clergyemen ought not to be buried in oblivion. A small volume has lately been published, giving an account of the Confessors of 1662—two thousand in number,—of the principles on which they acted, and of the oppressive measures under which they suffered. Facts and anecdotes are added characteristic of the times in which they lived. The title of the little book (published by Mr. Snow, of Paternoster-row) is "The Two Thousand Confessors of Sixteen Hundred and Sixty-two." The author of the book, Mr. Thomas Coleman, declares "it is not written under any feeling of hostility to the ministers or members of the Church by law established," and we believe the author to be sincere in that declaration. All honest men—no matter what may be their form of faith—ought to detect persecution; and every good man, be he creed what he will, cannot but respect those who have made great sacrifices rather than abandon their conscientious convictions. Mr. Coleman has collected a great mass of interesting particulars respecting the sufferings of the persecuted Protestant ministers, from the passing of the Act of Uniformity to the accession of William III. Those who have seen a "Free Church" founded in Scotland may be permitted to hope that, witnessing the virtue that has been exhibited in their own day, they can appreciate as it merits the noble and heroic conduct exhibited by Nonconformist ministers during the reigns of Charles II. and James II.

ARDEL KAREN.—The appearance of this celebrated character on the scene, and his decoration with the Grand Cross of the Legion of Honour, offers a remarkable contrast to his betrayal and imprisonment in France. Why he was so dealt with there has never, to our knowledge, been publicly declared; but we can state on high authority, that the only excuse alleged on behalf of Louis Philippe for what was literally an act of treachery, was that the word of the ex-Emperor could not be trusted. He has now, however, truthfully and handsomely proved his integrity and honour, and shewn that his engagement might have been relied upon, though a cracked p-ly did him so scandalous a wrong. There are facts for history.

CRYSTAL PALACE.—ARRANGEMENTS FOR WEEK ENDING SATURDAY, SEPTEMBER 23rd.
MONDAY, Open at Nine. **DISPLAY OF GREAT FOUNTAINS** and **ENTIRE SERIES OF WATERWORKS**, at Four O'clock.
TUESDAY to **WEDNESDAY**, Open at Ten.
WEDNESDAY and **THURSDAY**, **THE GREAT FLOWER AND FRUIT SHOW.**
 Admission, **Children** and **Saturday**, Half a Crown; **other days**, One Shilling; **Children under twelve**, half price.
Friday, open at 1 1/2, to Shareholders, gratuitously, by tickets.
 Half-a-Crown **Season Tickets**, available till the 30th APRIL, 1861, may now be had.

CRYSTAL PALACE.—FLOWER SHOW.—The Great SEPTEMBER / SHOW OF RADIANT ASTERS, ROSES, HOLLYHOCKS, VERBENAS, GLADIOLUS, FLOES, &c. &c. and FRUIT, will be held on **WEDNESDAY** and **THURSDAY** next, **SEPTEMBER 19th and 20th.**
 Open at Ten. Admission, **Wednesday**, Half a Crown; **Children**, One Shilling. **Thursday**, One Shilling. **Children**, Sixpence. **Season Tickets** free.

CRYSTAL PALACE.—CLARA NOVELLAS' FAREWELL TOUR.—
TWO PERFORMANCES, on a large scale, of the **CREATION** and **MESSIAH**, will take place in the Handel Orchestra, on **WEDNESDAY**, the 20th, and **THURSDAY**, the 21st, of **SEPTEMBER**. The Band will comprise the principal performers of the Swedish and Worcester Festivals, the band of the Crystal Palace Company, and numerous additions, professional and amateur. The **Chorus** comprises numbers of some of the choirs of the metropolitan, forming in all an orchestra of about 2,000 performers. Principal Vocalists: **Mrs. Clara Novella**, **Mrs. Susan**, **Mr. Walter Cooper**, **Mr. Salsbery**, and **Mr. Wynn**. Organist, **Mr. James Oswald**. Conductor, **Mr. Benedetto**. Tickets of admission Half a Crown each; Reserved seats, arranged in blocks, as at the Handel Festival, Half-a-Crown extra for each day; or a set of admission and reserved seats tickets for the two days, 1s. 6d., may be had at the Crystal Palace; at 2, Exeter Hall; or of the Agents of the Company.—Early application for **Forward** reserved seats is requisite.

SUBSCRIPTIONS FOR "THE LONDON REVIEW" received by **Messrs. W. H. SMITH & SONS**, at 181, Strand, and at all their Railway Book-stalls.

PISSES & LUNN'S SWEET SCENTS.—*Frangipani, Kio-mu-quick, White Rose, and others from every flower that breathes a fragrance, in bottles, 2s. 6d. 6s. 6s. in a case 7s. Sold by every fashionable druggist and perfumer in all parts of the world.*—*Laboratory of Pisses, 2, St. Mark's-street, London.*

SCALE OF CHARGES FOR ADVERTISEMENTS.

FOR EVERY LINE—ONE SHILLING PER WEEK.

Every additional line, after Four Lines, 6d. per week.

Advertisements exceeding One Column in Width are charged in proportion.

THE LONDON REVIEW

AND
WEEKLY JOURNAL.

SATURDAY, SEPTEMBER 15, 1860.

On Friday, the 7th inst., a day before the time he had appointed, Garibaldi, attended by no other escort than the officers of his staff, entered the city of Naples, amid demonstrations of unbounded enthusiasm. Losing no time in providing for the maintenance of order and good government, he organized a provisional ministry, and proclaimed Victor Emmanuel King of Naples and Italy. In the afternoon a motley crowd of men and women armed with unsheathed swords and daggers, priests bearing crucifixes and banners, armed monks with smocks over their shoulders, and hussars armed with pikes and bludgeons, poured in incredible numbers into the streets, shouting—"Viva Garibaldi!" "Viva Italia!" An illumination followed. On the following day the Sardinian flag floated from the forts, and Father Gavazzi celebrated a "Te Deum" in the cathedral.

On Thursday the king, hearing that Garibaldi had reached the terminus of a railway within a two hour's journey from Naples, had judiciously withdrawn to Gaeta, on board a Spanish steamer. No part of his own fleet accompanied him—the reluctance of the officers to abide by a sinking cause having been increased, perhaps unnecessarily, by a threat from the Sardinian admiral commanding two vessels in the bay, that he would fire upon any crew who should adopt such a course. From Gaeta it was at first understood that the king would proceed to Spain; but it is since reported that he has received advice from the cabinets of Dresden, Munich, and Vienna, which will induce him to repair, instead, to Germany. In the mean time the ambassadors of Austria, Russia, and Prussia have received instructions from their respective Governments to follow him to Gaeta, a course which they had, along with the Papal nuncio, previously adopted. The representative of France has left Naples on his return to Paris.

When the news of Garibaldi's triumphant entry into Naples, and the king's withdrawal to Gaeta, reached Rome, a panic ensued, and insurrection broke out both to the north and south of the Apennines. The Papal commander declared all the towns which had exhibited symptoms of revolution to be in a state of siege. Monsignor Belli ordered the sack of Ostia, while at Fossombrone the inhabitants were vanquished by the overpowering numbers of the mercenary troops of the Papacy. Under these circumstances, on Tuesday, without waiting a reply to an ultimatum sent to Cardinal Antonelli, 25,000 Sardinian troops entered Umbria, and were followed on Wednesday by 25,000 more. They have since attacked Pesora, taking the fortress with 1,200 German mercenaries, and the commander, Monsignor Belli, who has been removed to Turin. In the mean time Ostia was capitulated to the insurgents, and Urbino has been fortified by the inhabitants, and placed under a provisional government. A deputation from Umbria and the Marches on Tuesday last waited upon Victor Emmanuel, to solicit his protection against the Papal troops, and obtained a promise of assistance, which was anticipated by the march of the Piedmontese troops over the frontier, and was followed on the same day by the publication of an address from the king to the army, in which the purpose of the intervention in the Papal States is explained and justified. "You do not go (he says) to revenge

injuries done to me and to Italy, but to prevent the popular hatred from unloosing itself against the oppressors of the country." Strong representations have been made by Russia and Prussia, at Turin, against intervention, but it is certain that those Powers will take no strong measures to oppose the progress of the Sardinian troops in the Papal States.

The interview of Louis Napoleon at Chantilly with the Sardinian ministers, M. Farini and General Cialdini, appears to have had a more important object than was at first imagined, it being now asserted that it was there arranged that Victor Emmanuel should forward the intimations to Cardinal Antonelli, above referred to, stating that, unless he disbanded his army of foreign mercenaries, the Piedmontese troops would enter the Marches and Umbria. If this course was dictated by Louis Napoleon—and it can scarcely be supposed that Piedmont would otherwise venture on the decisive policy she has since adopted—it is puzzling to explain the publication, a few days ago, of an article in a semi-official French newspaper, which expresses sympathy with the Pope, and threatens the withdrawal from Piedmont of the favour and countenance of France, should a policy of intervention be persisted in. We can only account for the apparent inconsistency between the actions and the professions of the Emperor, in this case, by supposing that he finds it necessary to conceal his real policy from those classes in France who consider any interference with the temporal rights of the Pope as little better than an heresy.

In the mean while Louis Napoleon continues his progress through the old cities of Provence and Languedoc, receiving the felicitations of mayors, presidents, and prefects, and replying to them in enigmatic speeches. At Marseilles he delivered another important address on the present state of affairs. "Although," he says, "some envious murmurs have reached France from afar, let her not be distracted on that account; they will be scattered against the influence of the people as the waves of the ocean are broken against the shore. Let Frenchmen labour to develop the resources of their country. The works of peace are crowns as beautiful as those of war." In the future of greatness and prosperity which he contemplates for his people, Marseilles occupies a prominent position, by "its proximity to the military port of Toulon, representing the genius of France holding in her hand the olive-branch, without casting away the sword which hangs at her side." From Marseilles the emperor is to proceed to Algeria, where he will be received by the Bey of Tunis and one of the Maronite princes, and preside at a great festival in honour of his visit, to which, it is expected that Arab horsemen will repair in thousands from all parts of the French territory.

In emulation of Switzerland, England, and Belgium, France is to have her rifle movement and shooting matches, a decree having been published, *more Gallico*, in an official paper of this week, calling into existence all the requisite machinery of annual *Plas* and prizes. The first meeting will take place in the Bois de Vincennes, on the 30th of this month, and will continue for nine days. For the chief prize of 2,400 foreigners are allowed to compete, so that the heroes of Wimbledon may have another chance of contrasting their skill with that of their continental rivals, and of deciding whether we still retain the firm nerve and snoring eye of our old bowmen.

The National Association of Germany, which has been sitting for some time at Coburg, has attracted, perhaps, less attention than its proceedings merit from the British public. The debates, reported at great length in the continental newspapers, have terminated in a series of resolutions which may be assumed to reflect the feelings everywhere prevalent in Germany. The Association deem it their duty, by all the legal means at their disposal, to promote the institution of a central executive power, and a common Parliament for all the German states. They expect that all Germans will make the sacrifices required, to secure the unity and greatness of their common fatherland. If Prussia is prepared to protect the national interests in every direction, they express a conviction that the people will be found willing to transfer the central executive power to her, as the largest state in the Confederation of purely Germanic population. To these resolutions they add a note, declaring that Germany ought to take no part in a war between Austria and Italy; that it is her duty to arrest the interference of France in the contest, but that she must at the same time beware of adopting a course calculated to perpetuate the servitude of the Italians who are now struggling so nobly for national regeneration. As a practical commentary upon this expression of sympathy with the cause of Italian liberty, 100 German volunteers set off last week to join Garibaldi, for whom the utmost enthusiasm is manifested, more especially in Prussia, in spite of the dilemma in which the national cause is placed by the antagonism of France and Austria.

For some days back reports have been circulated in Vienna that a strict and cordial alliance has now been entered into between Austria and Russia with the view of putting an end to a state of affairs which menaces the general peace of Europe. A meeting, it is added, between the two emperors is to take place at Warsaw, to which several of the German princes have been invited.

The Federal Council of Switzerland has made an appeal to Europe for the protection of the neutrality of the Confederation, to secure which they demand permission to fortify the Simplon Pass, and to obtain the cession of a margin of land on the south side of the Lake of Geneva, two miles in breadth.

From all parts of Great Britain good accounts continue to be received of the state of the crops, which the fine weather of the last eight days has enabled

the farmers to reap and bring home in good condition. All fears of a scarcity during the winter are now dispelled.

In the absence of parliamentary intelligence, public attention has been directed to a subject of the very highest importance to the future prosperity of this country, viz., the production on our own territories of the raw cotton and flax on an adequate supply of which our whole manufacturing industry depends. Mr. Bazley, as mentioned in our Money Article of last week, has addressed a circular to persons interested in the cotton trade, inviting their attendance at a meeting of spinners, merchants, and capitalists, to be held in the Town Hall, Manchester, on the 14th, convened for the purpose of forming a limited joint-stock company, to promote cotton cultivation in India and Australia. The Government have favoured the undertaking, agreed to make grants of land on terms almost equal to a gift, and promised to give assistance, where needed, in procuring labour.

In the flax districts less progress appears to have been made in organizing measures for the production of an abundant supply of the raw material, for a deficiency in the supply has produced very bad effects on the markets. Last week, however, Dr. Forbes Winslow, the reporter on the products of India to the Indian Government, delivered an address on the subject in the Town Hall at Leeds. This country, he remarked, depended for its supply of cotton on America, for its supply of flax on Russia. There were strong reasons, social and political, why we should become, if possible, independent of both countries. Northern India possessed a soil which was admirably adapted, by its mechanical and chemical properties, to produce flax. Why should not the example of the cotton manufacturers of Lancashire be followed? We did not require to plant colonies, or bring waste lands into cultivation; we had merely to convince the native cultivators in India of the advantages of growing flax, with the view of selling it to English purchasers, and Dr. Winslow had no doubt that if the course he recommended were adopted, not only an ample supply of flax might be obtained, but that a lucrative trade in the products of the West Riding would spring up with regions of Asia into which our commerce does not at present penetrate.

The annual feast of the eaters at Sheffield took place on Thursday last, Mr. Roebuck's annual speech on current topics was as spirited as it generally is, and was received with much enthusiasm. In spite of the London newspapers, he maintained that the House of Commons had not misapprehended the last Session of Parliament. Although they had passed few measures for the regulation of the internal affairs of the country, they had been the very harp of the liberty of the world—they had sent a voice across every sea and unbroken chain, everywhere proclaiming the supremacy of liberty, justice, and truth.

Kindred topics have just been discussed by Sir Archibald Alison at Glasgow, in an address which he delivered on Monday night, "On the best System of National Defence." The recent vote for the fortification of England he characterized as one of the wisest things ever done by the Parliament of this country. There are, he said, three grounds for fearing a general war in the present state of affairs. It might arise from French ambition; it might be provoked by an attack by the Italians on Venice; or it might spring out of the complication in Syria—it having long been the policy of France and Russia to effect a separation between England and India. But he believed that the resources of this country were such that, provided we took measures in time, and showed the spirit of which symptoms had been exhibited at Hyde-park, at Edinburgh, and at Knowsley, we might bid defiance to the whole world in arms.

Arrangements have been completed for the Queen's visit to Germany. Her Majesty she left Balmoral on Thursday, en route for Osborne, whence she will proceed, by Gravesend, to Cologne. During her stay on the continent, Lord John Russell will be the Secretary of State in attendance.

The Prince of Wales continues to make a favourable impression on his future subjects beyond the Atlantic. He has accepted the invitation made him by the inhabitants of New York, to visit the great centre of American wealth and commercial activity. The last information we have of his proceedings is, that on the 29th of the last month he reviewed, at Montreal, the volunteers and the troops of the garrison; and on the 31st ascended to Ottawa, by the river of the same name, he being met by six steamers and a flotilla of 150 barge canoes, manned by 1,500 hands-on, who closed up in two lines, and escorted him to the city.

News of a painful character has been received from New Zealand. On the 27th of June last, a military expedition left the town of Parnaki, to assault the Waikato to a pah where the rebel natives have been for some time entrenched. The attacking party consisted of about 350 men, including two companies of the 40th regiment, a naval brigade, and a body of artillerymen and engineers. A breach having been made, the English troops attempted to take the encampment by storm; but, after a desperate struggle, were repulsed with a loss of twenty-nine killed and thirty-three wounded. The rebels have since strengthened their position, and committed several depredations. On receipt of this intelligence in Melbourne, the whole of the troops in the colony of Victoria were despatched to New Zealand; those stationed in New South Wales, South Australia, and Tasmania, received orders to hold themselves in readiness to march at an hour's notice; and authority was granted by the Government for the enlistment, in the absence of the ordinary troops, of an additional volunteer force of 10,000 men.

MONEY AND COMMERCE.

THE extremely fine weather which set in early last week, and effected a very remarkable change in the feelings, if not in the fortunes, of the community, has continued in the present week, and been even finer and more beautiful. In the fortnight, a very large part of the harvest has been gathered; and though the harp-owners of Kent and Sussex will suffer, and potatoes are diseased and will be short, there is now every probability that the people will have plenty of bread at a reasonable rate. Since last week the corn markets have continued, on the whole, to decline; but, under present uncertainties, comparatively little business has been done, and prices are not very determined. The wheat, too, as it is thrashed out and brought to market, is found to be extremely diverse in quality, some wheats weighing 63 lbs. and 64 lbs. to the bushel, and others not more than 50 lbs. Great differences accordingly ensue in price; but, on the whole, it is rather lower than last week.

Most of the other markets have increased in activity this week, in consequence of the improved prospects of the food market. Even the cotton manufactures, which, depending a good deal on the foreign market, were slack last week, have revived this week. An unusual quantity of business has been done in the raw material at Liverpool, and the price has advanced. Other markets, too, feel the benefit of increased orders and increased consumption, and additional cheerfulness is experienced in them all.

We have, perhaps, but little reason to regret the slackness in the cotton manufacturing districts, so far as this is the result of the decline in the exports to India, for it is quite plain from the Board of Trade tables recently published, that much of the increase in those exports in 1857, 1858, and 1859 was due to the large English force necessarily employed there, and to the large portion of the national savings that were expended in India. If the trade be now less it is more profitable and useful to the nation; and the manufacturers who then benefited by it will now reap the profit of an enlarged home trade.

The consequence of the increased activity in the business markets is an increased demand for money. The applications at the Bank have been comparatively numerous, and yet the general terms of discount outside the Bank are not quite equal to its minimum rate. Money is likely to become dearer, in consequence of the improved harvest, and the spar which this is giving and will give to trade.

Cowals, as the index to the stock market, have undergone but little change in the week, but have been depressed somewhat below their proper value by political events. Only by them are they now unfavourably influenced, as the circumstances of the country are improving.

The railways show the effects of the improved prospects of the country, by a general revivification in the price of shares. The increased activity in all the markets will bring more business to the railways, and make up perhaps for deficient travelling and small their dividends.

The colonial markets, except that of rice, have improved, and been active in the week, but as supplies generally are ample, there is no pressure on them. Coffee has again advanced a little in price, and seems continually tending upwards.

The failure of Messrs. Smith, Seligman, & Co., in the linen trade, which we noticed last week, has been followed, as was expected, by some other failures of less importance; and, like many other failures, it has brought on some gentlemen a great deal of well-deserved censure. They are described as two young men, who started into business without any capital, but who have managed to get economically into debt. It is intimated that they have found in some bankers, too ready to discount worthless paper, auxiliaries in incurring these responsibilities. For taking credit improperly they are inexorable, but the persons who trusted them were parties to the delusion, and are as little as they to be censured.

One of the events of the week, too, is the occurrence of commercial difficulties in Australia. A minor crisis has occurred in New South Wales, and there have been several stoppages. Here again we find credit at fault. The mutual trust

has been excessive, and led to narrow a fund, which, if not paid, and cannot be said, in the present condition of the world, that credit can be dispensed with. All trade is carried, on to some degree on credit. The whole profits of the Joint-Stock Banks, and other Banks, are made by the confidence of the people who place their money in the keeping of those banks. The less capital they have in proportion to their business, the larger their profits. The most princely merchant takes credit on many of his transactions; and on almost every cargo that is shipped credit is taken long before it is sold, that other cargoes may be continually shipped and sold. It must then be recognised that trade neither is, nor can now be carried on without credit, and consequently it is the business of all traders to take especial care to regulate credit on a just basis. They should neither take it nor grant it, except for legitimate commercial purposes. What those are, it would take long to describe. To ascertain them is the business of merchants and bankers, and literary men can only state the fact, without pretending to give them instruction. We can only affirm that credit is now an indispensable part of business, and being rapidly progressive, from unavoidable causes, it becomes one of the most important duties of all traders and money-dealers neither to give nor to take too much credit, and neither give nor take any for improper purposes.

The Bank of England, at the annual Half-yearly Court of Proprietors, held on Thursday, has declared a dividend of 5 per cent. for the six months ended August 31st. This is equivalent to 10 per cent. per annum—a very handsome dividend, yet not equal to the dividends lately paid by the other Joint-Stock banks. The profits of the Bank in the six months are estimated at £710,143. On the 30th of August the "rent," or sum added to Bank capital from savings, was £3,736,169; and after deducting from it the sum necessary to pay the dividends, it would be £3,088,480.

The most markets are firm this week, at the late decline of price.

MEN OF MARK.—No. I.

BARON LIONEL DE ROTHSCHILD, M.P.

When Parliament assembled after the general election of 1847, a gentleman of Jewish physiognomy took his seat under the Gallery, and listened with great interest to the debate on a Jewish Disabilities Relief Bill. He was of the House, but not in the House—honoured with a seat upon the bench reserved for Peers, although not a member of the Upper House. The Session of 1848 found the same gentleman, upon all important debates, occupying the same seat. Was he a foreigner studying our laws and language? He was certainly a person of consideration, or he would not be allowed so conspicuous and honourable a place in that assembly. The Prime Minister of the day frequently went up to the Peers' bench to shake hands with him, and the most distinguished representatives of the people stopped to exchange salutations and remarks with this constant attendant upon their debates.

In the month of July, 1850, this gentleman, to the honour of Sir Robert Inglis, Mr. Plumptre, and Mr. Newdegate, quitted his seat, and walked up the floor of the House. The Clerk at the table seemed to mistake him for a member, for he presented him with the New Testament upon which members are sworn. The individual with the Jewish physiognomy thereupon said, "I claim to be sworn upon the Old Testament." Much confusion arose. Horror and astonishment were painted on the faces of sound Protestants and High Churchmen. The gentleman was desired by the Speaker to withdraw. A debate ensued, and it was agreed that the Speaker should ask the Jewish-looking individual—"Why he demanded to be sworn on the Old Testament?" "I wish you," rejoined Sir Robert Inglis, "Why, indeed?" said Mr. Plumptre. The gentleman who had been desired to withdraw now marched up to the table again. "Why do you demand to be sworn upon the Old Testament?" asked the Speaker. "Because (he replied with the utmost coolness) that is the form of swearing which I declare to be most binding on my conscience." Being again desired to withdraw, much debate ensued. The fancy of the Jewish individual to be sworn on the Old Testament was treated as somewhat absurd, but rather harmless than otherwise, and the House accordingly directed the Clerk to swear him on the Old Testament. Being again permitted to approach the table, our friend took the oath of allegiance and supremacy, kissing the Old Testament after each oath. The oath of abjuration came next. The House was crowded, but an intense silence prevailed as the Hebrew gentleman, *en route*, repeated the oath after the Clerk. When the Clerk came to the words, "On the true faith of a Christian," with which the oath concluded, the gentleman suddenly paused, and added—"I omit these words, as not being binding on my conscience." He then put on his hat, kissed the Old Testament, and quickly added, "So help me, God!"

The Ministerial benches cheered. The Jewish gentleman took up a pen, to sign the parliamentary roll, assuming that he was a member of the House, and had passed through the usual formalities. Great excitement prevailed. The very girls of Sir Robert Inglis became purple with fear and indignation. There was a strange getting into Parliament by a *coup de main*—a larger slipping through the door left ajar with the chain up. The Ministerial benches, on the other hand, cheered the act. In another moment the Jewish gentleman would have shaken hands with the Speaker, and rubbed noses with the Prime Minister. Luckily, Sir Frederick Thesiger started to his feet from the front Opposition bench. The gentleman was again directed to withdraw. Another debate ensued. The lawyers got hold of the question, and exhausted themselves in legal quibbles. Several minor bills were abandoned, in consequence of the time lost that year in demonstrating (what every one knew) that the Jewish stranger could not take his seat without an Act of Parliament. This proposition was formally put upon record by the Attorney-General of the day, at the instance of a *Procurator* who was the steady and consistent friend of religious liberty. The House resolved, by large majorities, first, that our Jewish friend could not take his seat without an alteration of the law; and secondly, that it would take the subject into its serious consideration at the earliest period of the next Session. A member named John Bright early asked Lord John Russell whether he would relinquish office if his bill for enabling the Jewish gentleman to take his seat were again thrown out by the Upper House? No response was made to this mischievous inquiry, while the ironical cheers and laughter of the House seemed to declare that no amount of talent could sweep up a Whig Ministry to this pitch of virtue.

For twelve Sessions that persecuting Jewish gentleman was seen on the Peers' bench of the House of Commons, separated only by a gangway from the House, at the table of which he regularly presented himself after every general election. Year after year the well-known features re-appeared upon all important debates, and especially when the Jewish individual himself was himself interested in the issue. He had to listen to motions for leave to introduce bills for his relief and "emancipation" to debates upon the first readings of these bills; longer debates upon second readings; discussions in committee; renewed debates on third readings; and "more hot words and more protests on the final question ("that the bill do pass.") It was supposed that some influential persons here else had strong objections to the relief or emancipation of the Jewish gentleman; for we never heard of any of those measures receiving the Royal Assent. At last members on both sides began to grumble. The Liberals grumbled that so much time was withdrawn every year from the business of practical legislation, in order to pass bills which were certain to be kicked out in the House of Lords. The Tories grumbled that the Jewish gentleman would not take an answer, and go away. Some said the question ought to be hung up for twenty years, by which time a silent and unperceived revolution might occur in public feeling—as if Parliament would not contain a *Sophter* in the end of all time!

The friends of our Hebrew friend at length lost all patience, and began to grow turbulent. They not only bullied Lord John, but they bullied Mr. Disraeli for not bullying Lord Derby and the bench of Bishops. The great Whig constitutional authority gave signs of coming down from his lofty pedestal of an Act of Parliament. He muttered a hope that he should not be obliged to admit his

Jewish friend after all by resolution of the House. He seemed to be falling on evil days. We perhaps never shall be told how dexterously and successfully that Derivative leader in the Commons turned the screw upon his chief in the Upper House, yet we know enough to recognise his advocacy of Jewish claims as the most honourable and statesman-like passage of his public career. The first thing the Hebrew stranger heard this descendant of his race say on taking his seat under the Gallery in 1847 was—"Where in your Christianity but for their Judaism?" He was then Lord George Bunsell's lieutenant, little expecting to be so soon his biographer. Ten Sessions later found Mr. Disraeli still manfully and heartily avowing his opinion that legislative powers ought to be given and might safely be entrusted to the gentleman under the Gallery. So strong were the feelings of irritation among his more bigoted followers in 1856, that if they could have met together in a room after the division on the second reading, they would have deposed the right honourable gentleman from the leadership of the Opposition. From 1847 to 1858, the Jewish gentleman was in a state of consultation with Sir Frederick Thesiger, a thorn in the flesh of Mr. Spooner, a note out of tune to the susceptible ear of Newdegate. All this seemed to trouble our Hebrew friend very little. He came and went at his pleasure. He left the House without ceremony, and sometimes failed to come down at all when the debates grew dull. He became in good case, grew stouter in the legs and fuller in the face, began to show a sprinkling of grey hairs, increased his racing-stud, and very nearly won the blue riband of the turf, in a year when Lord Derby, as usual, had had it all his own way in the House of Lords.

It was clear that the Jewish gentleman was a remarkable man—a representative man. During all these years he had never incurred reproach into the dirty life of the House of Commons. He had come to be regarded a mute and persistent witness of English intemperance. He weighed heavily on the conscience of the House. He was the English Mordchai, who sat at the king's gate, refusing to do homage to the Thamus of Idgity, and biding his time. At last came a day, in July, 1858, when the ancient people, in the words of their old chronicles, "had joy and gladness, a feast, and a good day." The Hebrew champion walked up the floor of the House. The ease, comeliness, and unpretending bearing which had characterized him throughout the years of his exclusion, did not desert him now. Very many an eye glared, and many a bosom swelled in sympathy with his triumph—the greater because so slowly and so hardly won. Here stood one of the sanctifiers of Scripture, a noble no longer left of his comrades, a prince returned from exile and degradation. The spectators remembered that he was one of a race who could look back along many thousand years to an ancestry beside which that of the representative and scribes of the proudest families who watched him was but of to-day.

There was but one thing wanting to the grandeur of the spectacle. The whole House of Commons should have risen to its feet to celebrate the event. The representative of a religious race, than which no other has ever been the mark of persecution so long sustained, of bigotry so resolute, of prejudice so intense, of calumny so enduring, was now solemnly incorporated into the sovereignty of Parliament, and became a member of the House of Kings. Then walk up the floor of the House of Commons was worth more than the Austrian heron which he had inherited from a sheerd and weakly sire. It was a prouder gift than any that could grace the most costly coronet. It was a nobler thing than the supremacy over merchant princes, although this also, it was said, belonged to the massing gentleman whom Lord John Russell accompanied to the table amid the cheers of the House. He was not desired to withdraw now. The Old Testament was tendered to him now without question and without scruple. He took the oath, and omitted the words "on the true faith of a Christian." The Speaker shook hands with him, and he had seen his full face too long, and should now be glad to see him in profile, and dismised the "new member" to the congratulations of his friends, and the fullest enjoyment and exercise of legislative privileges.

During these eleven eventful years, the hero of this biographical sketch had known no idle or uneventful life. Every day he was seen passing down a narrow lane in the busiest part of the city, through a gateway not incapable of being barricaded in the event of popular commotion. The letters placed before him every day bore the post-marks of every continent, capital, and indeed of every considerable city in the world. His day was in the intricate web of European finance as familiar to him as the lines and yards of a great ship to a sailor. His companions and relatives at Vienna, Paris, Frankfurt, and Naples, were clothed with prince, and on easy and familiar terms with their most trusted favourites and ministers. If a sovereign or a state wanted money, it was to one of his uncles or cousins they first turned, and on hour afterwards the news, never unexpected, was flashed in cypher to St. Switzburg-lane. If a revolution or an *evénement* broke out in any capital, the most active newspaper correspondent always found a mysterious-looking Jewish person at the telegraph office before him. The gigantic magnitude of the financial operations of his house enabled it to give princely rewards for credit and unselfish services to all. By watching the barometer of public credit, by following the signs of the times, and lastly by acquiring the confidence of the mercantile interests, this great monetary organization held imperial sway in the world of finance.

Considerable misapprehension, it is believed, prevails as to the nature of the monetary operations of the house of Rothschild. By many they are supposed to be gigantic speculations in the public funds of Europe, who alternately raise and depress the value of public securities, and who realize enormous gains by selling when Government stock is high, and buying when it is low. Those traditions had their origin in the days of the Baron Lionel's father, the late Baron Nathan Meyer de Rothschild, a native of Frankfurt-on-the-Main, who came to England in 1799, and who is so well remembered on the Royal Exchange. The late baron was a speculator, daring, original, and far-seeing. The present baron and his brothers are by no means speculators of this type. They are traders of a safer school. Perhaps it would be more correct to say that theirs is the greatest accurate agency in the world; for their operations are not confined to the con-

times of Europe. Like Alexander they have sighed for worlds to conquer, and have established a house in the United States, for which, in time, a victory-price may be found in one of the baron's sons. They are large traders in tobacco and other produce, and do not disdain an agency or a share under the Limited Liability Act. A few years ago they were extensively engaged in the quack-drug trade. As mercantile agents they pay the commissions and dividends of most foreign bonds and railways. They have largely invested in the French railways, and are extensive holders of Great Northern of France Railway stock. They are buyers (when the price suits them) of English, foreign, and colonial securities of all kinds; the one condition appearing to be that it shall be immediately convertible into money at some price or other. They have large loans transactions with the Russian Government, and also a Brazilian Government Agency of an extensive and lucrative character. Their operations as bullion dealers are facilitated by the careful watch kept upon the foreign exchanges, and form another and distinct branch of their business.

Their dealings in the English Funds are said to be to a considerable extent vicarious. Every post brings them commissions to sell and buy to a large amount in the English Funds. They are thus agents for foreign speculators, rather than speculators themselves, and do a safe and profitable business at a small percentage. When great political complications are imminent, the amount of their foreign and domestic commissions proportionally increases. The transactions of the stock-brokers whom they are known to employ are watched on these occasions with the utmost eagerness. The greatest discretion is demanded at such conjunctures, and their operations are said to be shrouded in mystery; the most ingenious measures being taken, not unfairly, to prevent outside speculators from benefiting by their special knowledge.

The trafficking in the public funds is a game of skill in which they are not called upon to show their hand to your adversary. To what extent the house of Rothschild goes into the market as a principal, and how far it acts simply as an agent, is one of those trade secrets which they are not likely to disclose, and which, if it came fortuitously into our possession, we should by no means divulge. What is more certain is, that the Marcha Charta of the house declares that the sum of one million sterling shall always be held in Consols, as a margin for contingencies, and a security against depreciation. The late Lord Ashburton used to say, "It is a good thing always to have a floating balance of a hundred thousand pounds at your bankers." The Rothschilds are their own bankers, and Lord Ashburton would doubtless regard their floating balance with peculiar complacency, only diminished by the difficulty of finding safe and profitable investment for the surplus when nominal accretions of per-centages, commissions, and interest swell it beyond a reasonable limit.

The Baron Lionel de Rothschild, was born in London in 1808. He was early destined by his father for commercial pursuits, and received his education at Göttingen, mainly in consequence of the facilities offered thereby for the study of the continental languages. When in his twenty-eighth year he formed a matrimonial alliance with his cousin Charlotte, daughter of the Baron Charles de Rothschild, of Naples. In the same year, 1836, he lost his father, whom he succeeded as a Baron of the Austrian empire, and also as head of the mercantile firm that bears his name. In 1847 he was first elected a member for the City of London, which decrees all honour for its successful fidelity to the cause of Jewish Emancipation. In June, 1848, after the rejection of the Jewish Disabilities Bill by the House of Lords, Baron Rothschild accepted the Clitham Hundreds, in order to give his constituents an opportunity of expressing their opinion on the subject. The Tories put up Lord John Manners to oppose him, but the Baron won in a contest, having polled 6017 votes, while the son of the house of Rutland only obtained 2811. In July, 1850, the constituency of the City, being impatient at the postponement of the Jewish Disabilities Bill, urged the Baron to claim to take his seat. Baron Rothschild complied, although it was believed with some reason at the time, that he was acting contrary to his better judgment. Thereupon ensued the scenes above described. Lord John Russell held that the Baron had been ill-advised, and the noble lord being then at the head of the Government, two resolutions were framed by him, the first of which, as above stated, declared that the Baron was not entitled to vote or sit in the House until he should take the oath of allegiance in the form appointed by law. When the Lords pertinaciously rejected the Jew Bill year after year, Lord John found himself hampered by his own resolution, for his constituents began to express doubts of his sincerity, and demanded that the Commons should admit the Baron by resolution of their own House, without consulting the Peers. For several years previous to his resignation, Mr. Maitland was very warm, and Lord John, from his official position, could not be asked to concern himself with the local business of the City. The electors, therefore, greatly needed Baron Rothschild's services, and would have had a fair excuse if they had elected some other representative until the Baron became able, by an alteration in the law, to take his seat and do them parliamentary suit and service. But they never for a moment faltered in their determination to re-elect Baron Rothschild, and they were at length rewarded for their enlightened public spirit.

The Baron derives great assistance in his commercial transactions from his next brother, Anthony, who is said to resemble the late Baron in some respects more than any of his brothers. All the children of an Austrian Baron also become entitled to the same rank. Baron Anthony received an English baronetcy on the death of his father in 1836, with remainder, in default of male issue, to his nephews, Nathan Meyer, Charles Alfred, and Leopold, the sons of his brother, Baron Lionel Rothschild. A third brother, Baron Meyer de Rothschild, has a seat in the House of Commons, having been elected for Hythe in 1859.

The munificent charities of the Baron and Baroness Lionel Rothschild are well known. The schools, hospitals, educational institutions, and societies for the relief of distress among the poor members of the Jewish population in the metropolis, receive not only liberal contributions, but frequent visits and personal assistance from the ladies of this benevolent family. The Baron's country

seat is Gunnersbury Park, Middlesex, famed for its horticultural productions and floral beauties.

The late Baron Rothschild, speaking with intimate knowledge and undoubted authority, said, in 1832,—"This country is in general the Bank for the whole world—I mean that all transactions in India, in China, in Germany, in Russia, and in the whole world, are guided here and settled in this country." Sydney Smith remarked:—"The warlike power of every country depends on their Three-per-cent. If Caesar was to reappear on earth, Wotchell's List would be more important than his 'Commentaries.' Rothschild would open and shut the temple of Janus." To be at the head of a firm of the greatest contractors and money-lenders in the world would be by many considered distinction enough for one man. But money-lending, loan-issues, scrip, and bullion, will never confer on Baron Rothschild a title of the honour and historic fame which has won in fighting the battle of Jewish Emancipation, and in being the first Jew who took his seat in the British House of Commons.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

If the town is empty and home topics scarce, the news from abroad makes up for the deficiency, and the excitement of foreign intelligence increases every day. The King of Naples has not only retired upon Gaeta and Capri, as I expected last week, but I have just learned that he has taken his departure altogether, and, what is of more consequence, has left his entire fleet under the command of Victor Emmanuel, "King of Italy," whilst Garibaldi has entered Naples—by the way of Livorno, as I predicted—one day before his promise. This promise in any other man would be called bravado, given at a moment when he was upwards of 100 miles from the capital. His reception, and the joy of the people, are well described by the correspondents of the daily papers, whose business is with wars and rumours of wars. I have seen private letters from civilians travelling at Naples, which more than confirm the accounts of the union and the good conduct of the entire population. These facts give the best guarantee for the permanency of the movement. There is no doubt that the "idea" of Italian Unity has made immense way since 1818, and that the people of the several states will make every sacrifice to maintain the position which they have won for the first time, and mainly by their own right hands. The King of Naples refused all sound advice. The Emperor of Austria ought to be warned in time. He can yet save his German and Hungarian rule by timely concessions. From all I can learn, I believe he is disposed to act fairly. He is certainly not now waddling in the Italian middle.

Victor Emmanuel has taken a decisive step, or rather Count Cavour, with his usual sagacity, has seized the right moment to come to the rescue. The atrocities of the mercenaries of Lamorice have emboldened the Sarlinian army to enter the States of the Church, for which they were evidently prepared.

Whilst chiding in with Napoleon in his prediction to respect the rest of the Pope's empire, and the small Italian neighbouring principality of Viterbo and Comacina—it is evident from his proclamation to his army that Victor Emmanuel is resolved that there should be no intervening hostile territory between the union of the north and south of Italy, for which Garibaldi has polished the banners in the royal palace at Naples. It is said that certain powers have protested. But the King of Italy has claims which no other power can prevent to, for settling the affairs of the Peninsula, and for stopping the massacre by the hirelings of the Pope of the people who have unanimously chosen him for their king. There is every reason to be confident that the rest of the Papal territory will be annexed, and that no diplomatic troubles will follow. The fate of Rome itself is another problem. But herein Napoleon and Victor Emmanuel are agreed, and it is certain that England will not interfere. Nor has Austria any intention to meddle with the settlement of the Italian question.

Much regret is felt in all circles for the premature death of the Right Hon. James Wilson. It is not, we believe, very generally known that the late Chancellor of the Exchequer for India, was at one time the writer of the city article for the *Morning Chronicle*, in the days when the *Morning Chronicle* was a power in the State. Although scrupulously diligent and perfectly accurate in the performance of his duties, still it was considered that his style was dry, and his manner of giving the reasons of his labours inefficient. For this purpose of stiling him, the performance of his task, Mr. Alexander Mackay, also connected with the *Morning Chronicle* (author of "The Western World"), was selected to sit Mr. Wilson in the construction of his sentences. The conjunct labours of both were found beneficial to the *Chronicle*. Time passed on; Mr. Alexander Mackay's abilities as a writer attracted attention, and he was sent out to India by the Manchester Chamber of Commerce, to report on the circumstances, national, social, fiscal, or legislative, which prevented the profitable culture of cotton in our Eastern Empire. The climate of India proved fatal to him; and he was called off in the prime of his early manhood. At a later period his more mature colleagues had also been struck down in India, when all the tolls of his useful life had been crowned with complete success. How little at that time did either of them contemplate such a similarity in their doom!

The Irish newspapers of the past week contain an account of the presentation of a magnificent sword to Marshal MacMahon, from the members and associates of the "Young Ireland" party. The sword was tendered as a testimony of the sympathy of that party with the cause that had been triumphant at Magenta. The persons who collected subscriptions for the MacMahon sword have also been acting as recruiting-sergeants to send Irishmen to Rome to fight for the Pope. At the battle of Magenta, the strongest and surest ally of the Pope was the Emperor of Austria. "The Young Irishmen" raise recruits for the Pope, and compliment the conqueror of the Pope's best friend! If the Austrians had defeated MacMahon at Magenta, Garibaldi would not now be singing

as *Le Diable au Corps*, nor would the Pope have ever been reduced to such a miserable strait as to seek for aid in either men or money from Ireland—and yet they who call themselves “the Pope’s friends” are found paying homage to the most successful and vigorous of his foes! Such is the inconsistency of persons who have no fixed principles, and whose sole motive for all they do is to obtain notoriety. How wise and just was the observation of Lord Macaulay, when applied to such meddlers in public affairs.—“Notoriety has for low and bad minds all the attractions of glory.”

Whilst the weather has so greatly improved, I was sorry, in a short trip to the country, to see what little advantage has been taken of the beneficial change. Even in the home counties there are still several fields of standing corn waiting for the sickle or the reaping machine.

There is not much doing in town improvements, though the season is now most propitious. The water has been let in St. James’ Park, and the pond cleared out. The concrete bottom is found to be in perfect order, and ought to be introduced also into the Serpentine, instead of squandering money from year year in puddling and abortive experiments.

The new street from Court-garden to St. Martin’s-lane is progressing slowly, under the dictatorial superintendence of the Metropolitan Board; whilst the great thoroughfare on the Surrey side, to connect London-bridge with Waterloo and Westminster does not seem to proceed at all.

The other new street, to release the Court Garden traffic, through Tavistock-street to the Strand, is nearly finished. On the left-hand side leaving the market, the new flower-market is progressing towards completion. There are three glass roofs erected, which have a light and cheerful appearance, and will form a suitable companion for the Floral Hall on the other side.

The basins for water in Trafalgar-square have been cleared out. Could not some attempt be made to improve the fountains themselves, and to make them in some degree worthy of their position?

I am glad to see that you advocate so ably the necessity of embankments on both sides of the Thames. These works must eventually be constructed, and the sooner we begin to look at the diffusive in the face the better.

Musical has migrated to Worcester, where one of the great festivals is now held, for which the Midland Counties have become so famous. “The May Queen” is the most attractive of the novelties. Clara Novello, Miss Reeves, and Weiss are the most popular of the singers—and Dalli, Pruten, and Salton of the instrumentalists.

The English Opera for the approaching season at Court Garden is announced. Mr. E. T. Smith has made no sign of any winter entertainment at the great house in the Haymarket.

The General Omnibus Company, which has hitherto all its original professions, and has never produced better vehicles, nor the promised system of circulation after the *Paris* model, has begun to raise its fares where the rival carriages are taken away, and the dangerous system of “cursing” is again renewed wherever opposition still exists.

The cabs, too, continue all their attentions to the public, which are made more complete by the abolition of the street.

The railways also produce their quota of autumn accidents, chiefly due to the excursion trains and the language of the signposts, which ought to be restricted to night traffic. These accidents are more common on the northern and central lines, and are scarcely known in the south.

THE GOUTY PHILOSOPHER.—No. X.

MR. VANSTAFF ARRESTS THE NECESSITY OF HAVING “A PECE OF THE DEVIL” IN ONE’S COMPOSITION.

It is no paradox to assert, with the old Scotch proverb, that if a man would keep the devil altogether out of him, he must have a little of the devil in him. The homoeopaths tell us that like kills like, and that poisons which create headache cure headache. Upon this principle a few gladiators of the essence of devil “taken medicinally” at proper times, may weaken the devil in the blood, if they do not entirely eradicate him from the system. For want of a proper flavouring, spice and fire of devil, an otherwise estimable person may lose caste, character, and usefulness. Of what avail is it that a man’s heart overflow with love of all created things; that he have the uttermost repugnance to harm a fly or a worm, much more a fellow-creature; that he be benevolent and beneficent, free-handed and open-hearted, liberal as sunshine, and garlanded with all the kindly virtues, if he cannot say “No,” when he ought to say it, or reprove a sinner, lest he cannot give the sinner pain! Such a man is commonly delicate to be too good for this world. At the best he is a lamb among wolves, a dove among serpents, a herring among whales, or a witness for the plaintiff among the defendant’s counsel and attorneys. The world is not his friend. He has fallen into an alien planet; and is as out of place as if he were in Lapland. The vulgar affirm him to be “soft,” or “green,” or say that “he has a date house,” or is “tendered in the upper story.” The ladies compliment his heart at the expense of his head, and call him “amiable”; while men of the world, with hard heads, pronounce him to be “silly,” and look upon him to be mischievous.

A person of this temper so earnestly desires to see everybody happy about him—so detests to be troubled with the folly or wickedness of his kind, that he allows the faults of his children to go unpunished and unsurpassed,—denies them nothing that their greediness or vanity demands; suffers his servants to be lazy or dishonest; allows his tradespeople to cheat him; lends his friends and relations money, which they never intend to repay; puts his name to bills of exchange to oblige blackguards; permits all sorts of rogues

and swindlers to defraud him; gives impudent beggars alms, not so much to relieve them as to be rid of them; and believes every lie that is told him. The result is, that he becomes a bad citizen and an encourager of misdeeds, and paves hell with his good intentions. Such a man is bad enough in private life; but when he is elected pope, or born into the condition of king or kaiser, grand duke or emperor, or any other hereditary ruler, let the nations look well to him! There are peril and revolution before them, civil or foreign warfare, bankruptcy, ruin, and desolation.

What caused the murder of Edward III. in Berkeley Castle, and started the night air with the—

“Shrieks of an agonising king?”

Nothing so much as the want of a seasoning of devil in that amiable person. What filled Richard III. with those too certain presumptions, wherein he lamented and prefigured his own doom, and talked of sitting upon the ground to—

“Tall and stately of the death of kings!—
How some have been decapitated, some slain in war,
Some haunted by the ghosts they have deposed,
Some poison’d by their wives, some sleeping killed,—
All murdered: for within the hollow crown
That rounds the mortal temples of a king
Death keeps his court?”

Surely his want of the essential condiment of devil. What lured the bosom of Henry VI. to the murderous sword of the Duke of Gloucester!—and brought the head of Charles I. to the scaffold! Want of the proper spice of devil. It was owing to this defect in their characters, quite as much as the violence or wickedness of their foes and opponents, that—

“Many an old man’s wig, and many a widow’s,
And many as cyphers water-standing eyes,”

rued the hour that such unkindly kings were born. All these monarchs were heroes of very doleful tragedies; and such heroes they could not have been, had they not possessed too much of the softness and grace of the feminine character, and too little of the strong, unyielding determination of the masculine. Going back no further than to the time of Louis XVI., and thus coming to the verge of living experience, is it not found that it was the utter want of devil in that monarch which made his reign compact of devil, and consigned himself, his wife, his sister, his children, his friends, his servants, and his adherents, to the very deepest depths of sorrow and perdition, and entailed upon the generation aimed whom his unhappy lot was cast an amount of misery and calamity unparalleled in the history of the world?—misery and calamity which did not die with the age and the nation where they originated, but spread themselves over all Europe, like devastating plagues! The end is not yet; for they are acting themselves out before our eyes at the present day; and no man can predict when we shall have seen the last of them.

It may be useless, but it is more the less curious to speculate how different the state of Europe might have been in 1809, if, in 1789, Louis Capet had been a man with a hard head, a hard heart, and a disabused determination of purpose. Napoleon and Wellington, Nelson and William Pitt, Robespierre and Sautere might have lived, and left no trace. The blood shed in the civil discords of the “Terror,” and the lives of a million of men sacrificed in bloody and needless foreign wars, might have been spared.

The more recent case of Louis Philippe—the king of the barricades when he began his kingship—the king Smith of a street cab when he ended it, is equally in point. Let us try to discover from his history what brought the balloon of his power to so inglorious a collapse. Was it because he ruled by the vilest corruption? There have been monarchs even more corrupt whose names shine brightly on the page of history. Was it because he was not a human nature? There are few kings who do not speedily learn that vice, even if it be not implanted in them by nature, and who thrive all the better for it. Was it because he was self-seeking and ambitious? Because he wished to extend his influence unduly? Because he grasped at more than he could manage? He might have had all those faults and many more, and lived a quiet life in spite of them. He might have had them in double or treble degree, and died in the odour of sanctity and royalty, as better kings have died before him. Where, then was his fault? He had not a sufficient spice of the devil. He was a merciful man. He did not love the shedding of blood. His own faults had taught him lenity to those of others; and when he had in his power a certain Louis Charles Bonaparte—the hero of Strasbourg and Boulogne; instead of cutting his head off, or shooting him, as he might have done, he simply had him imprisoned, in a not very strong fortress, whence he escaped.

With a similar absence of strong will, when a small mob, half disaffected, half curious, and partly composed of boys and idlers, began to shout upon the Boulevards, in February, 1848, he would not take vigorous measures to keep the peace; lost a few strugglers should have been slain. What was the result? The people thought his guilty conscience made him a coward. The mob increased. The insurrection—unmanageable enough at first—began to surge, and roar, and growl;—the bells called into a sea, the sea into a stormy ocean. Even at the eleventh hour, had he given positive orders to his commander-in-chief, the tumult might have been suppressed, at a cost of human life not a hundredth part so great as was occasioned in the following year, under the orders of Cavaignac, when the Red Republic was quenched in seas of blood redder than its own flag. He might have scattered the disaffected with the greatest ease, and lived a king to the last moment of his life, and left his sons or his grandsons to

succeed him. But for want of devil he would not enter the irrevocable word, and we all knew the end. He fled where there was none to pursue him. He reached Newhaven, as Mr. Smith—died in exile—and left a new name to point one of the oldest moles in history.

How different is the fortune of his successor! He, at least, never lacked devil. He can say "No"—a bold, long, imperative and impudent "No," whenever state necessity or individual passion commands it. "Shall I thousand or ten thousand human lives stand in the way of my purpose?" "No!" and again, "No!" "Shall any consideration of the world, or the world's opinion, prevent the presidential chrysalis from becoming the imperial dragon-fly?" "No." And thus he rules; and bids idle to fill, not alone a respectable, but a resplendent niche in French history.

But I will not be too severe upon the emperor. There are nations and races—though the Anglo-Saxon and Scandinavian are not of the number—who so admire strength and power of will in a ruler, that they will forgive, in the possessor of these qualities, any crime or cruelties whatever. Oriental nations, more especially, delight in the spectacle of power. The sultan, who, positively and not figuratively, crushes his people under his chariot wheels—who dashes into the crowd and hews the women and children down with his scimitar, and who cuts off two or three heads per diem, before and after breakfast,—is their model sultan. They may curse, but they love him. He has a proper spice of the oriental devil in him, and is great and glorious accordingly. But the spice in our latitude must be of wholesome strength, or the possessor becomes too much of a devil for European endurance, and runs the risk of being accused of monstrosity rather than of heroism. Robespierre, Danton, and Marat, were overpowered, and Louis seize too little. There is a golden mean in devil, as in everything else. Ninety parts man, one part angel, and one part devil, is a goodly proportion; but with no devil at all, the composition is too good for this world, and will not keep wholesome in our atmosphere.

RURAL ECONOMICS.

WHY THE LANDLORDS DISLIKED THE BANKRUPTCY BILL.

A FLUENT gentleman who now occupies one of the seats for the "immortal" borough of Leominster, Mr. Hardy, and who certainly is not an exemplar of the "wisdom of Parliament," lately made a speech at the Leominster Agricultural Association, wherein, reviewing the proceedings of last Session, he said, "The Reform Bill was pitched out along with another which was to benefit the landed interest by making them bankrupts." Thereat the jocular and agricultural Tories present roared with laughter. There is, however, another aspect of the subject, which is not quite so jocular—to the effect, that the landlords in Parliament actually disliked the very complete and useful measure for consolidating the law relating to bankruptcy and insolvency, so ably introduced to Parliament last Session by the Attorney-General, Sir Richard Bethell, in very certain, and it will not be said that the outside public should get a hint or two as to the sources of that dislike. The House of Commons, in the course of the proceedings, recollect that the Bankruptcy Bill was defeated upon a motion for denying the cost of compensations, which were necessary for carrying out the improved administration of the bankrupt law, otherwise than by a charge on the consolidated fund. This motion had a popular and plausible look. It gave its supporters the appearance of protecting the tax-payers, and afforded them the opportunity—always relished by the "querulously" of alaming the lawyers. But, above all, it served to conceal the real grounds of aristocratic opposition to the bill. Yet, in the debate on that motion, and in subsequent conversations in the House upon the Bankruptcy Bill, the true cause of its defeat peeped out. (Grave Mr. Henley objected to that portion of the measure—one of its most valuable provisions—which assimilated the law of bankruptcy and insolvency, and declared that if the bill should become law, any landed proprietor, after a tour on the continent, might return to this country and find that he had been made a bankrupt, and all his effects sold off by creditors of his estate. But that most essential pillar of the aristocracy, which forget to mention that such a catastrophe could only happen where the landlord-tourist was hopelessly insolvent, or that the sale of his effects would have been made for the purpose of applying the money so produced towards the payment of his debts. Now, such an argument, though some of the premises were stark exposed, was perfectly correct, and would have done well in the House of Commons; and discreet advocates of aristocratic privilege, having attained their object by rejecting the bill on a point apparently quite distinct from that which alarmed the "landed interest," were content to leave the matter there. Indeed, not a few contemporary writers have attributed the withdrawal of the Bankruptcy Bill to petulance and disappointment on the part of the Attorney-General, overlooking the real and just grounds for the disappointment which that learned gentleman must have felt. The bill was founded on the recommendations of a commission composed of merchants, jurists, and landed legislators. It was earnestly supported by the leading and responsible members of the House, and, effectively, have removed difficulties experience had shown to stand in the way of creditors seeking to be paid that which is due to them, even though the debtors might be aristocrats and nominal landowners. And this was its unpardonable sin in the eyes of the landed aristocracy. The defeat of the Bankruptcy Bill was felt to be a triumph of privilege; and accordingly we find jocular and glibly-pated Mr. Hardy, coupling its defeat with that of the Reform Bill, and talking of the former as a measure "to benefit the landed interest by making them bankrupts."

Let us understand what this means. As the law stands, there are two branches which relate to persons unable or unwilling to pay their debts—the one the law of bankruptcy, which relates to traders only; the other, the law of insolvency, which is applicable chiefly to persons not defined as traders under the bankruptcy statutes. The law of bankruptcy is decidedly an advance and improvement upon the law of insolvency, so far as it affects creditors and honest debtors. Under it debtors may be compelled, whether

present or absent—and absence, in certain cases, is a proof of inability to pay—to surrender all their property for distribution, pro rata, amongst their creditors, and having fairly surrendered everything, debtors are discharged from future liability for their debts which inactionally or through inadvertence they may have incurred. The creditors obtain all the debtors possess, the debtors are free to try their fortunes anew without the impediment of a load of debt which would probably render future success impossible.

The law of insolvency is more anomalous. It has grown out of successive and piecemeal legislation. Formerly persons not traders, or whose effects were insufficient to induce their creditors to make them bankrupt when in prison for debt, were only released under Acts of Parliament, passed from time to time, to enable them to petition for their discharge. Then came the establishment of the Insolvent Debtors' Court, to which persons in prison for debt could petition, and, giving up all his effects for distribution amongst his creditors, would obtain his release from goal. For a time the process of the insolvent law could only be set in motion by the debtor, who, if content to remain in prison, might receive and expend any income his creditors could not seize. Now, however, when a debtor has been a few weeks in prison without presenting a petition for his discharge, any of his creditors may obtain an order from the Insolvent Court which has the effect of vesting all his estate in a public officer, the provisional assignee, for the benefit of the creditors generally.

When, therefore, a debtor is once caught and imprisoned, the process of applying his estate towards his debts is similar to that of bankruptcy. But it is necessary first to catch the debtor. Besides, there is another distinction which, to the poorer classes of insolvent debtors, is most important—namely, that after discharge by the Insolvent Court, the future acquired property of the debtor is liable to his creditors, and the future acquired property of the insolvent debtor. The Attorney-General proposed to render all debtors—traders and non-traders—liable to an improved bankrupt law.

Let us apply this to the position of the "landed interest," whose continued non-liability to the bankrupt law Mr. Hardy so exultantly celebrates.

As we have seen, the landowners are generally good representatives of wealth and power; they really possess great wealth. Naturally owners of large estates, they are often beneficently entitled by very small incomes, and in such cases, to be in debt is their natural and normal condition. And nearly all landowners hold their estates—commonly entailed estates—subject to mortgages, jointures, portions, and the like, which, more or less, render their real much less than their apparent incomes. There, like most persons with fixed or certain incomes, there is a tendency amongst landowners to spend their incomes by anticipation. The half-year's rental is largely required to pay off the bills incurred for luxuries or necessities enjoyed at antecedent periods. Thus, without assuming the existence of any extraordinary extravagance, a vast proportion of English landowners are constantly so much in debt that they would find it extremely inconvenient to be compelled at once to pay or come to a general settlement with their creditors. With the majority of them a compulsory and general settlement would involve a considerable reduction of ordinary expenditure; and with a few of them it would be a permanent alienation, for the sale of their life-interests might be necessary to pay their debts, and then, though the estate might remain with the next generation, not a few persons, at present of apparent importance, might be lost to the world of good society.

Mr. Hardy, however, a landowner who has gone a little too far may go ahead and not trust or rely on his own income, being protected by the legal interest possessed by his mortgages or trustees, may be transmitted and enjoyed in the sunny regions of the South, without the interference of vulgar creditors. They have no power over such debtors, who, keeping out of the reach of the sheriff's officer, cannot have their property touched by any creditor. The bankrupt law made application to all debtors would put an end to this—shall we say dishonest—state of things.

POPULAR SCIENCE.

BAROMETERS FOR COAST STATIONS.

EVERY year there are published by the Board of Trade, and by the Life-boat Institution, small maps, which, by means of dots, crosses, and other signs, indicate the number and kinds of wrecks upon our coasts. These data are sadly plentiful. It is curious, too, to see them sprinkled in twos and threes along our coasts; and then to see in more restricted areas whole lines of these sad monuments thickly distributed together. From the cliffs in Sandwich to Yarmouth the wreck-marks swarm and huddle each other, exceeding only in their terrible number by long arrays off Sunderland and the Yorkshire coast.

Every black dot signifies a total loss, by stranding or foundering, and every black dot represents, therefore, many saddened homs, many eyes darkened for ever to the brightness of earth, many mourners, widows, and orphans, deploring the sad catastrophe.

Between 1824 and 1859 the boats of the Royal National Life-boat Institution saved from destruction upwards of 11,000 human beings. It is something to turn from our first picture to this; something to think of such a crowd of thankful hearts living on to bear testimony to the value of the science, skill, and daring of man.

The casualties from wind and weather in our islands are mainly due to shipwreck. The lightning may strike some solitary house, or the hailstorm shatter green-house glass; long-continued rain may flood our meadows with a foot or two of water; and our worst of hurricanes may blow down a tree or mow a house; but little is the loss of life, few indeed the serious casualties.

Not so with our coast. Hundreds of ships are yearly lost, and many a brave fellow is hurled down in the deep. It is washed a lifeless corpse upon the surf-whitened shore. It is most important, then, as one means of probably preventing loss of property and life, that at all important fishing and coasting stations or harbours good barometers should be accessible to all whose vocations cause them to incur the dangers of the sea.

The Duke of Northumberland has long been actively and honourably associated with the Royal National Life-Boat Institution, of which he is the president, and with many other benevolent projects. Along the boisterous coasts of Northumberland, where disasters are sadly rife in stormy seasons, he has, in connection with the Meteorological Society of London, establishing, under the direction of Mr. Glaisher, F.R.S., and Mr. Sopwith, F.R.S., and President of the Meteorological Society, a complete series of stations, not less than fourteen in number. The primary object of the Duke (who generously contributes one moiety of the expense, the remaining funds being furnished by the Meteorological Society, and by subscription) is the saving of life; but in associating the undertaking with the Meteorological Society and with gentlemen of eminence, he takes the best means of giving an important scientific value to these establishments, insuring good instruments, and an efficient attendance on the observations. Mr. Glaisher is now in the district, personally superintending the placing of the instruments, which have all passed under inspection, and had their accuracy tested.

The fourteen stations are,—one on each side of the Tweed at Berwick, one on Holy Island, the others respectively at North Sunderland, Beadnell, Newton, Craner, Boulmer, Alnmouth, Amble, Cresswell, Newbiggin, Calleroarts, and Tyne-mouth. At all these places the instruments will be put in the view, either in the interior of the establishment, or outside the building, so that every one that will may have access to them at all times. A record of each day's fluctuations of the barometer will be kept by dots on a ruled scale, and lines drawn successively day by day from one point to the other, so that thus a straight, or an irregular, or a curved line would be formed, which would indicate at the first glance the states of the mercury for several previous days, thus adding to the efficacy of the indication given at the immediate time of observation. These diagrams are also to be publicly exposed; and a sailor looking at one would see what had been the *tendency* of the barometer. If he found, by the line drawn, that the variation had been little, the dots being nearly horizontal, and the glass still steady, he would know that no change was probable. If, on the contrary, he found the diagram exhibiting an ascending or descending curve, he would know that there had been a progressive rise or fall, and comparing this with the actual state, he would be enabled to judge whether fair or foul weather was to be expected, and, consequently, whether it would be prudent for him to put to sea or remain on shore.

Each station is furnished with a barometer, and a maximum and minimum thermometer, all of strong, plain, good workmanship; and the plotting of the thermometer by the side of the barometer-index is a great improvement, as both can be read together. With them are issued very plain, intelligible printed directions for using them; besides which the local observers will have the advantage of personal instruction and initiation from Mr. Glaisher himself, to whom daily reports of the instruments and of the direction of the wind will be periodically transmitted.

The meteorological observatories in the United Kingdom are exceedingly few, and every addition is a gain to science. One has already been established at Alnmouth by his Grace, and two others at Alnheads and Bywell by Mr. W. B. Beaumont, M.P. A very efficient one has also been established at Osborne by His Royal Highness Prince Albert, and another at Huddersham by the Earl of Leicester; but the total number of reliable observatories in the United Kingdom we believe falls considerably short of sixty.

The National Life-Boat Society is also about to plant barometers at its most important stations. And if the Duke of Northumberland's excellent example be followed by noblemen in other counties, we might look for a very important decrease in the annual loss of life, while the meteorologists of the metropolis would be put in possession of accurate and valuable information. Their science is still, singularly enough, almost a household study, great numbers of facts and reliable data, and extended means of observation. The community of interests which will link together these coastal observatories will undoubtedly ensure the records being kept with care; and we sincerely hope the results may be successful in realizing the benevolent intentions which have caused them to be established. Some projects have been suggested for large indices, visible at miles distant, so that from vessels at sea the indications of the barometer might be read by means of spy-glasses. To this it is objected that such indicators must be moved by hand, unless they were strictly looked after by paid attendants, and even then, they would be subject to neglect and error, and thus might be productive of mischief instead of good. We are inclined to think that

such indicators might be properly managed. The Tyne-side Naturalist Field Club have also actively taken up the subject, and have already printed some of their results.

The advantage to the county of Northumberland would be general, from more extended and accurate meteorological observations; for, besides, the usual connections with agriculture, navigation, or engineering, that county having no terrestrial reservoirs, such as our chalk or greensand, depends for its water supply on the actual rain-fall. Meteorological indications can hardly fail, under such circumstances, to be locally of great value in guiding the practical operations carried on in the district.

We hope public attention will, from time to time, be drawn to the meteorological stations throughout the kingdom, in all their bearings, but more especially as to their capabilities of forwarding the approach of storms and tempests.

APROPPOS DE BOTTES.

ONCE upon a time, the poet tells us, there dwelt upon the banks of the Cephissus a certain giant named Damastes, better known by his surname of Procrustes, or "The Stretcher." This cognomen the giant owed to a very eccentric, not to say monstrous, line of conduct. He possessed a bed whereupon he was wont to invite wayfarers to repose their weary limbs, and if the bed and the traveller suited one another as to size, good and well; but two contrived to bedevil the luckless night whose length of limb stretched beyond its bounds, for Procrustes would ruthlessly dock those presumptuous members until they coincided with the length of the bed. Equally hapless was he who, when reclined, left any space between his feet and the bedpost. His miserable victims were snatched and snored by Procrustes, until his bones were pulled from their sockets, he at last reached the required length. Such were the inhuman practices that were carried on for a long time by Procrustes, until one day he was himself made to try the effect of his own system, and in his turn was cut off by the hero Theseus. But what has all this to do with boots or shoes? A moment's patience, gentle reader, and you shall see. The author of the little work before us has written on his frontispiece the motto *Procrustes ante portam*—because he feels assured that the old giant is still at our very doors. Yes, though he was slain when the world was young, in the old days of the demigods, yet here we have him again in the year of grace 1860!

Having passed in revolving ages through a varied metempsychosis, we find him now alive again in the form of the boot and shoe-maker. He is still true to his ancient instincts, and, though for a bed he has substituted a last, he is as obstinate and relentless as ever. He has set up his false ideal of what a foot ought to be, and will have all feet conform to it, whatever may be their original shape. In the middle ages, the torturing machine called "the boots," was reserved for heinous criminals; but now it is more or less inflicted on the most innocent members of society. Happily, however, this unscientific empiricism in the matter of foot-clothing will no longer be suffered to rule undisturbed. The work before us shows the utter impossibility of the present system of boot and shoe making, and the immediate necessity of reforming it altogether. Before considering the existing forms of boots and shoes, it will not be without value to examine cursorily those employed in former times. The ancient Egyptians, the people of whom we have the earliest existing monuments, appear from their paintings and sculptures to have worn for the most part, a kind of slippers made of basket-work. The Egyptian empire, by degrees, had its heels trodden upon by the Assyrians, who, true descendants of Nimrod the mighty hunter, delighted much in stout thick-soled buskins. The Persians, who followed hard upon the footsteps of the Assyrians, used principally to wear slippers.

The Greeks do not appear to have troubled themselves much about boots or shoes, generally going barefoot. Their attention was rather directed to clothing and protecting their shins, from which they acquired, as is well known, the epithet of "the well-greased Greeks." Not so the Romans, who, by degrees, managed to stand in the shoes not only of the Greeks, but in those of almost every other nation of the habitable globe. They had a boot or a shoe for every class of society; and a senator or a slave was distinguished by the shape of his sandals, just as a *marchal-de-camp* or a *sergent-le-ville* of modern France are respectively known by the different angles at which their hats are cocked. Hence it was considered a great solicitation of the Emperor Gallienus to adopt the "little spike bottom" shoes, called *the inch* or so more or less of shoe-leather made all the difference between tragedy and comedy, and a thick sole only separated the sublime from the ridiculous.

It was, however, in medieval times, that fancy actually revelled in an elaborate variety of foot-gear. A certain fashionable aristocrat of the twelfth century acquired the name of *Ransham*, from a strangely-twisted shoe which he brought into vogue. Nay, even royal personages did not think it beneath them to bestow a very minute attention to their *chamarrs*.

Thus we find King John ordering "four pairs of women's boots,"—we suppose for his royal spouse.—"one of them to be embroidered with circles." His successor, Henry III., had his boots powdered with lionsels. In the next century a taste for eccentric foot-gear extended itself to all classes. "Their shoes and puttees are mounted and picked more than a finger long, crooked upwards, which they call crows, resembling devil's claws, and fastened to the feet with chains of gold and silver."

During the two succeeding reigns, in spite of legislative enactments to restrain them, the boots and shoes of the wealthier classes reached the outrageous length of two feet, which, as a chronicler of the period remarks, "was the most ridiculous thing that ever was seen." What, however, even this of Parliament failed to do, was very soon brought about by ever-changing fashion. Shoes became as lead as they had before been lead, and under the very appropriate name of duck-bills, protected the feet of Henry VII. and his bluff son and successor. The reign of Elizabeth is remarkable for an important change in the form of shoes. In Shakspeare's "King John" (Act iv. sc. 2.) a certain tailor is mentioned as—

"making, dippers (which is a light)
But lately thrust upon contrary feet."

* Why the *Four Shoes*. A Contribution to Applied Anatomy. By HERMAN MANN, M.D., Professor of Anatomy in the University of Zurich. Translated from the German by John Stirling Craig, L.R.C.P.E., L.R.C.S.E. Edinburgh: Edmonstone & Douglas, 1860.

In this passage we, for the first time, hear of shoes being made right and left. How long this fashion remained "in" we are unable to say. It was, however, forgotten in the last century, for we find Dr. Johnson making the following note on the above passage:—"Shakespeare seems to have confounded the man's shoes with his gloves. He that is frightened or hurried may put his hand into the wrong glove, but either shoe will equally admit either foot." The observations show that in the time of the learned lexicographer, shoes were made just the same for either foot; the present fashion was revived about the beginning of this century.

It is unnecessary to pursue the subsequent revolutions in the form of boots and shoes, or to detail the innumerable crotches, ruffles, red heels, buckles, straps, and tassels with which they have been successively adorned from the seventeenth century down to the present time. All of these will doubtless be more or less familiar to the majority of our readers. One peculiarity of the period in which we live is this, that, while in ancient times distinguished personages were nicknamed after boots and shoes, these necessary articles of clothing now generally assume the names of military heroes or princely individuals.

Thus we no longer dream of calling a cabinet minister "top-boots," or a prince of the blood "high-logs," but we do designate certain descriptions of boots and shoes respectively as "Wellingtons" or "Blüchers," "Albion" or "Clarendons." We have often wondered whether the Prussian Field-Marshal really did patronize the exceedingly clumsy and uncomfortable "high-logs" which bear his name.

What, however, is more important to notice is this, that in all the revolutions through which boots and shoes have run hitherto, it has almost invariably happened that convenience and health have been sacrificed in a great measure to a false idea of beauty and the caprices of senseless fashion. Hence it comes that now, in the latter half of the nineteenth century, we are as yet without a boot or shoe which is perfectly satisfactory, either in the requirements of utility or ornament.

But, while we smile with contemptuous pity at the "golden lilies" of the Chinese ladies, we forget our own grazed heels and aching corners. Assuredly, in the matter of shoes and boots, we are superior only in degree to the celestial inhabitants of "the middle kingdom."

But do not let our fair readers be too much frightened, for their case is not so bad as that of the stronger sex. If they can only wear their feet out of their boots, they will certainly be much gratified by the following extract from the preface to the work before us:—

"As to the unbecomingness of distorted feet and shoes, there really can be no exaggeration. Since my attention has been more particularly called to the subject, I have naturally been led to make observations more carefully than usual on the state of all feet coming under my notice in the street and elsewhere, and I find this result: that nice-looking shoes and shoes being stronger, are less liable to distortion, and their feet more so, while ladies' feet suffer less, and their boots more than those of the other sex; so much so, that it would appear quite logical to state the conclusion I have come to, on reliable grounds, as to proportion of distorted boots among the fair sex. They may amuse themselves, however, by knowing that these deformities are only apparent, and that it is in reality the true form of the foot asserting itself against fashion's corrupt shoe, and that to remove them they have only to show sufficient moral courage to adopt the proper shape, as hereafter set forth."

To those who would deny the importance of the shape of the boot or the shoe our author says:—

"The shape of the shoe has too much influence on health and comfort to be left to the dictates of fashion. The influence of fashion on the shape of the shoe produces the most baneful effects on the mechanism of the foot and on its soundness, and thus materially affects our moving about, and our consequent ability to take a sufficient amount of open-air exercise. It is quite clear that the foot must get inside the shoe, and if the shoe differ in shape from the foot, it is as plain as the fact, being the more pliable, must of necessity adapt itself to the shape of the shoe. If, then, fashion prescribes an arbitrary form of shoe, she goes far beyond her province, and in reality arrogates to herself the right of determining the shape of the foot."

The author then proves that the present system of boot-making not only produces chronic deformity in the feet of most persons, but something worse.

"The consequences resulting to the foot itself from an improper form of sole, are not limited to the fact that the deformity becomes permanent, but are of a still more serious and important nature. These more important evils are caused partly by the pressure to which the foot is exposed, and partly by the bad usage to which the distorted foot is necessarily subjected in walking. . . . In this manner arise those uneasily and painful swellings at the root of the great toe which, either from mistaking their true nature, or from wilful deception, are called *chilblains* or *gout*, just as the one or the other term appears the most interesting. In many cases, moreover, this kind of inflammation of the bones, and their investing membrane, may lead to the formation of matter, and eventually to the disease known as *caries*, or ulceration of the bone."

The shoe but certain produces distortion which causes from the ordinary form of sole will be best understood from a glance at the annexed diagrams.

boot made according to the usual manner. It will be observed that the toes have already begun to be compressed together. Fig. 2 shows the skeleton of the same foot.

The next cut (fig. 3) shows a yet further distortion. The toes, not finding sufficient room side by side, have been pushed over one another until, the position having become habitual, the distortion is permanent. Fig. 4 exhibits the skeleton of such a foot in a still more abnormal condition, when the joints, having been pushed out of place, have become inflamed, resulting in large diseased osseous growths at the root of the great toe.

The cause of all these distortions, alike uneasily and painful, is the prevailing form of sole, which is made as in fig. 5. The difference between it and fig. 6, which Dr. Meyer declares to be the only true form for soles of boots, will be evident on comparing the two outlines.

When distortion has resulted from improperly-made boots, boot-makers constantly pretend to remedy it by various contrivances. But Dr. Meyer shows most conclusively that, so far from these plans tending to remedy the harm already done, they rather increase it, and render it permanent. In fact, the theory of boot-making is at present at fault, and error lies at its very basis in a false form of sole. Having exposed these fallacious methods of cure, our author proceeds to show—*How a sole may be constructed for either foot.*

The following are his directions:—

"The length of the foot from the back of the heel to the point of the great toe is laid down in a straight line, *a, b*. The half of the breadth of the heel, *c, d*, should then be marked off on this line, and the centre of the heel is thus ascertained. The length from the point of the great toe to the point where the hollow of the foot commences—that is, to say, to the posterior margin of the ball of the great toe, *e, f*, about two-fifths of the whole length of the foot, is now to be measured and marked off in its proper place on the primary straight line, and thus the broadest part of the foot is found. At this place a line should be drawn, cutting the longitudinal straight line at right angles, and on this transverse line the greatest breadth of the foot is to be marked, so that just so much of the foot lies on one side of the long line as corresponds to half the breadth of the great toe, *g, h*, the rest of the whole breadth of foot falling on the other side, *i, k*. The longitudinal line is now curved in a little further forward, and when, passing to *l, m*, the inner margin, *n, o*, of the anterior sole is to be drawn, and for this purpose we begin at the inner termination of the transverse line, which indicates the greatest breadth of the foot. All the points essential to the construction of a proper sole have thus been obtained, namely, the inner margin of the anterior sole, the posterior boundary of the heel, and the greatest projection of the little toe. Around these points a sole may readily be constructed, as may be seen from the annexed drawing (fig. 21), in which the outline of the sole is filled up with dotted lines."

Having explained the construction of a sole for healthy feet, the author comes to consider the formation of the sole for those to which the toes have been distorted. His theory is at once simple and logical.

"The sole ought to be cut exactly as if the great toe were in its proper position. The ground for this is clear, for, if the sole be made to suit the foot, the ordinary shape is simply reproduced, since the deformity has arisen precisely through the foot accommodating itself to the shape of the shoe. The continuation of the injurious defects would thus be insured, and they might perhaps even be increased. If, on the other hand, the sole be made of the proper shape, it becomes possible for the great toe to resume its normal position, and thus restore the foot to its true form."

In the concluding pages of his book, after noticing the uselessness and absurdity of small and high heels, our author considers the best form of upper-leather. He condemns tight-fitting Wellington boots, but praises broad half-boots; many, however, will not agree with him as to the merits of elastic or self-boots, which he advocates as the best, to be, except for mere dress-boots, both uneconomical and uncomfortable wear.

The form of the upper-leather is, however, by no means so important as that of the sole; for the foot can stretch the former to its own requirements, but must accommodate itself to the latter. Hence we cannot too earnestly recommend to all our readers the attentive perusal of the little work before us, for the question of which to treat is one of universal interest. It is the duty of everyone to keep each part of his body in its normal and undistorted condition, as well as to see that the health and comfort of his friends and neighbours are not impaired or destroyed by blundering ignorance or fashionable caprice.

This useful pamphlet is no pretentious puff of some *ad-hoc* anatomical boot-maker, but the learned, though compendious *brochure* of a physiologist of great professional acquirements, and considerable literary experience in this special department of anatomy. It has, moreover, every appearance of having been translated with great fidelity and knowledge, and is furnished with a preface which at once elucidates it, and adds, if possible, to its value.

THE HELMSHORE DISASTER.

RAILWAYS are now as necessary to society as ever were common roads. There can be no longer any question of their usefulness, and it would be idle to expatiate on their advantages. Whatever lessons spring from the commination of man with man, from extending the knowledge of the material world, and of society, railways contribute to them. Excursion trains have naturally grown up with the system, and are now obviously a necessary part of it. Their increase and diffuse the advantages of railways. Between London and Brighton, London and the Isle of Wight, London and

FIG. 1. FIG. 2. FIG. 3. FIG. 4.
In the first cut (fig. 1) is shown the sole of a foot laid over the sole of a

the Highlands of Scotland, and London and Ireland, excursion trains run continually in season, and to many of them no accident has ever happened. Excursion trains, then, taking due precautions, can be run without accident; and though accidents have frequently occurred to excursion trains, numerous exemptions prove that they are preventable.

Excursion trains being especially useful in extending the advantages of the railway system to the multitude, railway directors must not be blamed for providing them, though they have only their own profit in view. Like other merchants or newspaper proprietors, who find their advantage in supplying material or mental food to a hungry multitude, railway directors, by running excursion trains, only meet, excite, and gratify a growing want. But in seeking their own advantage they must never serve the public. In fact, the two are in the end identical. Railway accidents are as injuries to the property of railway companies as they are destructive of life and limb. Excursion trains demand more care even than express trains; and there are some obvious rules concerning them which ought to be strictly followed. They should not be very long. If they consist of more than one *enfilade* of carriages the *enfilade* should not follow each other at too short intervals. They should rarely be run for any called chance purpose, not at very late hours, when the vigilance required for their safety cannot be easily exercised. Excursion trains, properly managed, serve the public, and are profitable to railway companies, but to attain the ends proposed they must be run safely.

We must be careful not to deprecate individuals for seeking their own advantage by serving the public. To this end we all minister to each other; wane; the inventor and improver in arts and the discoverer in science keeps his own interest in view, and blames the public if it does not reward him for any advantages he confers on it. He must leave others, however, to judge of his merit, and in serving them it is not induly to grasp power or profit. This is equally true of all classes of men. The subtlest and most just they are not, therefore, to be envied. It is, perhaps, more scandalous for statesmen to take advantage of their necessities to assume despotic power, to fleece or oppress the people, than for railway directors to run excursion trains without providing for their safety. Ignorance needs instruction; but those who dispense it are not, like the ignorant, to be despised, or to be treated with contempt and power for themselves. To supply each other's wants is not a crime, for our own profit, is indispensable—it is the real cement of society; but we are all bound to do so honestly, faithfully, and justly. This is equally the duty of railway directors and statesmen, and no more is exacted from the former than the latter. To perform our duty, no sacrifice should be spared, though it carry us to die like the soldier in the breach, or the sailor in the sinking ship.

The question with reference to the directors of the Lancashire Railway—the deplorable accident on which we recorded last week—is, Did they do their duty to the excursionists whom they undertook to carry from Haslingden to Manchester and back? It is not easy to say; the directors have not come to the end of the investigation, but enough has transpired to enable us to say decidedly that they did not. We will not relieve them by throwing the blame on their manager, Mr. Shaw; we fix it on them, for they are responsible for his appointment, his regulations, and his conduct. It is not said that the return from Manchester was delayed, but it is said that the train did not come till past eleven o'clock, or near midnight, before the last train left. It is dangerous to run regular trains at that hour, but to run irregular and exceptional trains when guards, engineers, and porters must be all drowsy, or worn out by the labours of the day, these trains carrying 2,500 passengers to and from a scene of enjoyment, the multitude elated and excited, and not unwilling guards to share their tipple as the train stopped, must be excessively dangerous; and the directors are to be censured for running such a large excursion train at the solicitation of the keeper of a public garden for such a purpose at such an hour. It appears, too, that there was no telegraph on the line to convey a warning. Such telegraphs are not only common in the manufacturing districts; we never before heard of them, and they are totally different in character and consequences from those excursion trains which carry multitudes from London to the sea, and return, unless some accident happens, long before midnight. The purpose and the time of this excursion train were wrong. It was a means of improvement, kept hurried hours, and encouraged dissipation for their own advantage.

Such schemes necessarily fall into confusion. For the train the guards were too few. This is Colonel Yelland's opinion, and, in spite of Mr. Shaw's contrary belief, is undoubtedly correct. If fourteen guards were on the train, too, had been on duty nearly sixteen and the other nearly fourteen hours. The breaks, therefore, if they were not too few, could not be, and were not, properly applied. An individual, not a servant of the company, exerted himself to work a break, and make up for the company's deficiency, but he could not succeed in stopping the train. If fourteen guards were on the first train required two guards, two guards to thirty-one carriages in the second train, of which the coupling-chain broke, was wholly insufficient. The neglected train drew up too quickly at Helmsboro, and the rebound broke the coupling-rod. To see that the coupling-rod of all these thirty-one carriages were in good condition—and the more carriages are multiplied, the greater must be the strain on the earlier coupling-rod—was one John Borke was specially appointed. One drowsy man, to examine the coupling-chains of thirty-one carriages in one train, fourteen in another, and twenty-four in a third, at midnight, is plainly insufficient. This single fact, and the manner in which Mr. Cooper, an officer of the company, spoke of it, betrays gross neglect and indifference. The management is culpably bad which is satisfied with asking John Borke, a porter, if the coupling of all these thirty-one carriages in three trains is properly secured, and with his assurance that it is. But this, it appears, is the general practice on the line, and the management is obviously defective. Excursion trains by night, it is admitted, require more care than day trains; yet one porter has to look after sixty-nine carriages, and to thirty-one carriages there are only two guards.

The disasters that happen under such management—the coupling-chains that break as coupling-chains have broken before, without warning the Lancashire Railway Company into thought—are not accidents, they are inevitable consequences of scandalous negligence. They are the results of criminal carelessness in the men who invite and receive payment for services which they neglect to render. If the law, which is too often scorned, cannot effectually reach such offences, at least they should be severely stigmatised by the

public. We join, therefore, from Mr. Mihill Slaughter's work on "Railways," corrected "to the present time," the following list of the directors of the Lancashire and Yorkshire Railway, that the public may address every one of them, if it please, according to the recommendation of our celebrated friend the "Goaty Philosopher," by the title of "His Scandalous Negligence."

Chairman, H. W. Wickham, Esq., M.P., Kirkless Hall, near Mirfield; Deputy-Chairman, George Wilson, Esq., Manchester; George Anderson, Esq., Chesham, near Leeds; Richard Adkins, Esq., Kirkstall Lodge; James Andus, Esq., Selby; Thomas Barnes, Esq., Farnworth, near Bolton; Wm. T. Blacklock, Esq., Pendleton, near Manchester; Jos. Craven, Esq., Steeton, near Keighley; Thos. Dugdale, Esq., Blackburn; Samuel Fielden, Esq., Todmorden; John Hartgreaves, Esq., Silwood Park, Berks; James Haslam, Esq., Manchester; James Holme, Esq., Liverpool; Wm. H. Horsley, Esq., M.P., Blackburn; John R. Kay, Esq., Eury; Wm. Leaf, Esq., Pendleton, near Manchester; Wm. Marshall, Esq., Penwortham Hall, near Preston; Jas. Pilkington, Esq., M.P., Blackburn; James Radcliffe, Esq., Rochdale; Jas. R. Ralph, Esq., Halifax; James Riley, Esq., Halifax; William Sturt, Esq., Liverpool.

INEDITED LETTERS OF LORD NELSON.

[Continued from p. 231.]

THE "battle" alluded to in the following letter was a controversy Nelson had become involved in with the Genoese Government, who accused him of having violated his word, a charge which he indignantly refuted, to the complete satisfaction of the King, who communicated to the Lords of the Admiralty his entire approval of the conduct of Nelson in his transactions with the Republic of Genoa.

La Mirra, Porto Ferraio, Dec. 27, 1796.

MY DEAR SIR,—As Sir John Jervis has wrote you, it is needless for me to attempt telling you any news from the fleet; and as I have related to Lady Hamilton my battle, &c., I shall only trouble you to assure the King of Naples that the neutrality which he has thought it proper to adjust shall be most inviolably sacred with me. My individual conduct, long as I have been in command, has been, and shall continue to be, uniform. The good faith of His Majesty, and good conduct of his Ministers, claim for as every attention and respect.

I was very sorry to hear that a Spanish vessel was taken out of St. Stefano, and if she is still at Porto Ferraio, she shall be instantly restored. The Admiral is equally displeased as myself. Should she, or her cargo, be sold, every proper reparation shall be made.

I have to beg that the letters for the Adriatic may be sent off express; they are most important in their object. I have not time to say that I must be forwarded. It is most probable, my dear sir, that this may be the last public occasion I shall have to correspond with you, therefore I have to request that you, from your own knowledge of my public conduct, since I have been in the Mediterranean, will, as a letter, or, as one line to Lord Nelson, inform me, if I think most proper (I believe it ought to be to the Duke of Portland), that I may lay my humble services at His Majesty's feet.

The late Victory has handsomely offered such a letter, and I do not Mr. Drake and Mr. Trevor will do the same. Believe me, dear Sir, your most obliged servant, HENRY NELSON.

Sir William Hamilton, K.B.

After some captures and adventures while in command at this station, Nelson went in the February of the following year to reconnoitre Toulon and Carthagen, and, touching at Gibraltar, finally joined the fleet off Cape St. Vincent, when he hoisted his broad pennant on board the *Capitain*. The hero was fortunate. The battle of St. Vincent took place the day after his arrival, and he was in the thickest of it. The list of killed and wounded affords conclusive testimony to the part Nelson bore in that famous fight. On the part of the British there were engaged, against twenty-seven Spanish sail of the line, for the most part of greater weight of metal, two ships of 100 guns each, two of 98, two of 90, eight of 74, and one of 64. The *Capitain* was a 74. Here were shattered thirty ships, in which the total killed was 73, and the total wounded 227. Of this amount, Nelson's single share, by means of this brave exploit, was 21 killed and 26 wounded. For his brilliant services on that memorable day, Sir John Jervis was created Earl of St. Vincent, and Nelson received the knighthood and Order of the Bath, and was promoted to be Rear-Admiral of the Blue.

Nelson now changed to the *Irresistible*, his own ship, the *Capitain*, having suffered great damage in the action. In the following April we find him blockading Cadix; but leaving the blockade in the hands of Sir James Saumarez, he returned to Porto Ferraio, to bring off the troops there. Towards the end of April he writes to Sir William Hamilton from on board the *Capitain*, to which he had shifted again, although he tells us that it was little better than a wreck, to be soon exchanged for the *Thecus*. At this time he is cruising off the southern end of Corsica, and the convoy to which he alludes was one which had troops on board, under the command of Captain Freemantle.

Capitain at Sea, August 17, 1797.

MY DEAR SIR,—I am just seeing a Spanish frigate and company, by the arrival of which I send you a line to say we are well, and the whole garrison of Porto Ferraio under my protection. You will be pleased to hear the King has conferred on me the most honourable Order of the Bath, and I expect Earl St. Vincent will be commissioned to invest me on board his ship, the *Life*. For his illustrious services I have only to beg my last respects to Lady Hamilton, and that you will believe me your obliged humble servant, HENRY NELSON.

Right Hon. Sir William Hamilton.

There is a letter of Nelson's, written at this time to his wife, which possesses a special interest, as showing the modest humility he placed upon his personal ambition, at a moment in which the highest honours his sovereign

natural, so easy, and so true to life, that it is surprising how Mr. Boucicault has contrived to evade a reputation which it is clearly in his power to make in this unoccupied line of acting.

The reception of the play is worthy of its merits; and if we were to suggest any improvement in its future representation, it would be to restrain the Anglo-Saxon brouhaha which at present interrupts much of the enjoyment of the audience. Apart from the inconsistency of allowing Mr. Billington and Mrs. Billington to deliver themselves in plain English, while the rest of the characters are to be accompanied by a dialect which is neither English nor Irish, the dramatic interest is seriously marred by the obscurity into which the dialogue is frequently thrown in the attempt to give it what is supposed to be the Hibernian turn. The scenes between Mrs. Mellon and Mr. David Fisher, for example, would be greatly heightened in interest if they were brought somewhat nearer to the English ear; and this could be easily done, without compromising their native humour, by the slightest tinge of the Irish intonation.

Miss Agnes Robertson appeared afterwards in a trifle called "She would be an Actress," intended to show her skill in the assumption of several characters; and the entertainment terminated with Sir David Fisher's clever little sketch "Music hath Charms," played with unflagging spirit. Mr. Fisher's Mr. Poppidon Pettinau is one of the most perfect bits of light-comely acting extant on our stage.

Reviews of Books.

THE VALLEY OF THE INDUS.*

EVERYBODY who was in the habit of going the rounds of London society a few years ago, must remember a tolerably portly Asiatic, with an agreeable expression of face and a royal air, who was generally to be met with in most of the circles, moving through the rooms in a fashion of stately urbanity. He was no less a personage than the famous Meer Ali Moomed, who, up to 1856, had been the recognised native sovereign of Upper Sind, and the proprietor of a large portion of his territories, in consequence of a charge of fraud brought against him, and substantiated on testimony which he declared to be suborned, had come over to England to obtain restitution. It was not so easy, however, to obtain restitution of Indian impositions in those days, when Lord Dalhousie, carrying his schemes with a high hand, was supported at home by a power which might or might not stand between the appellant and the crown. Of the merits of Ali Moomed's case we will not venture an opinion. He was charged with having substituted, in a certain treaty, the word "Pungmah," which means district, for "Deh," which means village; thus fraudulently obtaining the cession of a province instead of a town. The persons who appeared against him were alleged to have been of notoriously infamous character, and the principal witness is said to have confessed, on his deathbed, that his evidence was false. The Meer all along asserted his innocence. Guiltless he may have been, or guilty only through the craft of others, and his own entire negligence in the conduct of public business; but be that as it may, he determined to come to England to sue for justice at the foot of the throne, and the Court of Directors determined, on their part, to frustrate his object, by refusing their assent to his presentation. His mission, consequently, was barren of everything but disappointment and mortification; and when the Meer broke out, he vented his services to keep the peace in his own country, and his object was soon gladly accepted by the Government, for the sake of getting rid of him; and he accordingly set out for India, not without an understanding, or a hope, that his loyalty to the British alliance, which, in the worst of times had never been called in question, would secure for him, at last, the restoration of the alienated districts. In that unfulfilled hope—if, indeed, hope is to him justice turned into despair—he still lives, and will, no doubt, go down to his grave.

Captain Langley's relations with Meer Ali Moomed arose out of these circumstances. He had known him, and been employed by him, during his residence in London; and when the Meer had reached Trieste, on his way back to India, the moral difficulties of a large and prodigious Oriental train, who could not speak a word of an European language, and who were involving their master in pecuniary embarrassments, beset the unlucky Sovereign, and Captain Langley was invited from London to take the part of secretary, and accompany him to India. His mission was not only accepted, on the stipulation that the engagement was not to last beyond a twelvemonth; and Captain Langley set forth on his expedition to the rescue at Trieste, accompanied by a "distinguished parliamentary friend," who figures in his pages under the initial "F."

The volumes before us contain the results of Captain Langley's observations during his residence at the "court" of the Meer, and a great deal also about Indian life and sports, picked up from former experience, and gleaned from books. The publication has no pretensions to literary skill, and is to be read rather for its matter than its manner. The descriptions of the places visited were evidently taken down at the spot, and bear the unmistakable marks of accuracy; and the panorama through which we are thus carried, if not very admirable as a work of art, is entitled to confidence for its fidelity. Perhaps there is a little too much dry information introduced. We could spare some of the pages about soil, and climate, and troops, and local statistics. Figures and technical particulars have an inflexible tendency to make books dull. But they are given by Captain Langley with so much sincerity of intention, and are presented to us in places where they so usefully illustrate the immediate scene or subject under consideration, that we do not feel their momentum as forcibly as we should do under other circumstances, and we go on with the book in spite of them. The sporting anecdotes are capital, and the accounts of the scenery and life generally in the valley of the Indus will be read with interest.

The Meer's passion is Sport in all the shapes in which it can be pursued in India, and through all its agencies, from hawks up to elephants. He looks soberly on horseback, and is an inspired man out of doors, compared

with what he is within. As to the affairs of state, he still governs a region over which he exercises sovereign power; they may go by the mast, so long as he can get good shooting; and we can easily understand how a prince of this sort devoted to one absorbing amusement, and willing to delegate hard work to others, at any risk of being made responsible for acts which he would scorn to commit in his own person, may have been duped by crafty instruments in the affair of the treaty. Such a construction of his complicity is not without some probability, and seems to be strengthened by Captain Langley's apparently honest estimate of his character, and, above all, by that preposterous entire conviction of his innocence. At all events, it is clear that the life of Ali Moomed is that of a man who is unconscious of the responsibilities of his position, and who is, therefore, liable, at any moment, to become the victim of the chicanery which his own negligence encourages around him.

His household is much the same as that of all other Eastern potentates, only that it transcends them all in the inadequacy of the means to the end. It is a sort of squalid prodigality. Everybody about him is in a state of ostentatious beggary; and the terrible struggle between show and prudence set out on the fat of the land before it comes to maturity yields one of those pictures of Oriental wretchedness of which we had a faint recollection in the latter days of the Oude dynasty at Harley House.

Turning from the ministers and the soldiers to the ladies of the establishment, we have some close pictures of the interior of the Zenana, which are curious in their details, and valuable for their authenticity. The particulars are furnished by Mrs. Ghulam Hussain, a lady of the household, who resided for weeks together with the princesses, and who had more favourable opportunities of observing the domestic habits of the inmates of the palace than any other European lady ever possessed. She describes the life of the young princesses, daughters of the Meer, as being very monotonous; but we have no account of the source of the debt which she incurred, to which we recommend the perusal of the work, will doubtless find them interesting.

ÆSOP'S FABLES, IN GREEK AND ENGLISH VERSE.*

It was at one time maintained by a very learned British Jesuit, that all the writings of ancient classical authors, with very few exceptions, were borrowed unthinkingly from the exceptions being the works of Cicero, Pliny's *Natural History*, the *Satires* and *Epistles* of Horace, and the *Georgics* of Virgil. As to "The Æsop," the Jesuit Father declared, it was manifestly the composition of a Benedictine monk of the thirteenth century, and its object plainly to give, under the semblance of the voyages and adventures of Æsop, an allegorical description of St. Peter's journey to Rome. He also affirmed it to be no less clear that "The fables" of Horace were followed by the same hands that composed the "Æsop," adding that "Lalage," the charming nymph of the poem *Æsop*, was, in all probability, not a child of "the Christian religion!" It is scarcely necessary to state that the well-known *Fables of Æsop* must be included in the denunciation of the Jesuit, of whom his opponents said he was "in credulity a boy, in audacity a youth, and in old age a roving madman."

"*Cruditiora puer, audacior juvenis, delirior senex.*"

So far as "Æsop's Fables" are concerned, researches made within the last five-and-twenty years fully justify the accuracy of the strange and universally-contradicted assertion made by the learned Jesuit in the seventeenth century. The prose collection of the fables of Æsop, which were at one period a very common school-book in this country, are now proved to be "spurious"—and actually the composition of "some monk!" The earliest edition of these fables turns out to be "so clumsy a forgery," that it mentions Æsop, who lived 250 years after the date of the composition, and contains a whole sentence from the Book of Job. A second collection of the same fables is traced to Marinus Plineus, a monk of Constantinople, in the fourteenth century. It is proved to contain one Hebrewism, and many modern Greek words.

The monks who gave these prose narratives of Æsop's fables, did not invent the fables themselves. Some of the fables are to be found in ancient authors, each telling them in his own manner. Where, then, did the monks find the fables? Modern research has traced out the source from which these versions are derived; and it is now demonstrable that the prose collection of Æsop's fables, and the classic and Latin versions, have been mainly based on the writings of Babrius—the author whose works were not only translated from before the public. Here, then, we have in the fables of Babrius that which may justly and rightfully claim to be "the basis, or stock material, of all that comes down to our day under the name and credit of Æsop."

This is a very interesting fact; for who is there that has not taken a delight in the fables of Æsop, whether he has read them in "the spurious" Greek prose, or the Latin version of Plineus, or in the fine old story of Sir Roger L'Estrange? And now, it appears, after the lapse of so many centuries, that the world is indebted to the diligence of an author whose name and writings had been buried in complete oblivion. The sermon of Beutley had indicated the remains of some such poet as Babrius. Search was made for his literary remains by Tyrwhitt. Fragments were discovered in the Bodleian, and more abundant materials in the Vatican, libraries; until at last a Babrius was discovered in 1841 in the convent of St. Laurens, on Mount Athos; and in 1846 the first edition of Babrius was put forth in England by our present Secretary for the Home Department, Sir George Cornewall Lewis. Of that edition it is said, and with perfect truth, that "its editor's Latin notes, concise, and to the point, strike the scholar as the model of what Latin notes should be, and which he would have been glad to see who, if it may be asked, was this Babrius, to whom the world is indebted for all the pleasure and instruction conveyed to mankind under the name of 'Æsop's Fables!' Alas! all is doubt and surmise on this material point. We have naught to rely upon but probability and conjecture. Vossius is silent respecting him; Lemprière is a blank; and his name does not appear in the last edition of Feller, in 1847. It is believed he was a Greek, having

* Narrative of a Residence at the Court of Meer Ali Moomed; with Wild Sports in the Valley of the Indus. By E. A. Langley, late Captain Madras Cavalry. 2 vols. London: Hurst & Blackett.

* The Fables of Babrius. In Two Parts. Translated into English Verse from the Text of Dr. R. C. Lemprière. By J. J. Vossius, M.A., sometime Scholar of Lincoln College, Oxford. London: Lockwood & Son, 1861.

some connection with Asia, and that he was contemporary with the Emperor Alexander Severus, who died A.D. 235. The first Greek metrical version of the *Æneid* fables is supposed to be that of Babrius. His fables are written in the Ionic dialect, and in Chaldaic metres.

Such is the sum-total of the information to be communicated with respect to Babrius. And still we are beset with the suspicions of the unbelieving Breton Jesuit. First of all "the moral" to each of the fables,—the quaint, epigrammatic, shrewd morals,—what is said concerning them! Comparing those attached to the "young Whigs" with Babrius' "versified" version of the same "morals," there are numerous differences discoverable between the one and the other. Sir George Cornwall Lewis has marked down fifteen as undoubtedly spurious, seven as doubtful, and thirty as genuine. This is not all that is to be said on the charge of forgery. A second part of Babrius was edited, in 1859, by Sir George Cornwall Lewis, from a transcript furnished by M. Malay; and with reference to that it is said that at first considerable suspicion of forgery, with reference to the MS. from which the transcript had been made, was entertained. That suspicion is now at an end; and therefore it may be concluded, the literary world is placed in secure possession of the writings of a veritable ancient author.

The task which the Rev. James Davies has imposed upon himself is, to give as close a translation as can be effected, through the medium of English rhymes, of the verses of a Greek poet. The original work in Greek is described by the translator (we use his own words) as "easy, pure, and elegant." Neither, while it is far from being ornate, is it in any degree bold or vulgar. The translator adds that "his great aim has been to produce a version which, while literal, should preserve as far as lay in his (the translator's) power, the elegance and terseness of the original."

We wish we could compliment the Rev. Mr. Davies upon the success of his efforts; but what is to be said of such verisimilitude as the following:—

"Some came out at the helter skelter to kill,
Who loathed us, to them, destructive skill."
—*Æneid*, p. 25.

"The young'st hand, foremost with a shaven crown,
Was being 'washed by the perfumed crown,
Long did the foremost fill an ample dish,
By four shaven throats being discomfited."
—*Æneid*, p. 26.

A book of "fables" is one certain to be read by the young, and little doubt need be entertained that this new version of *Æneid* will be eagerly sought for. The translator ought to have calculated on the probable popularity of his work, and consequently left out whatever could not be pursued but with advantage by persons of tender years. Until we met with the fables of Babrius, we had restricted the notion that the most infamous of the many Italian tales to be found in the "Decameron" of Boccaccio, was derived from the abominable romance of Petrus Alfonsi. According to Babrius (part I., fab. xxi.), it is as old as the days of *Æneid*. But wherefore should it be translated into English verse? Why not mark it as amongst "the unimproved?" In the original form it could do little mischief, and certainly no English mind, previously pure, be contaminated by it.

If our space permitted, we might contrast the 118th fable in Part I. of Babrius, with Horace's version, lib. ii., sat. 6, lines 70 to 117, in order that it might be seen how superior was the Latin to the Greek poet. But this cannot be done. It only remains to say that, considering the preface, the notes, and the translation of Babrius, as executed by the reverend author, he is not open to the same reproach that was cast upon Verrius; for none can, with truth or justice, declare concerning him, and the time he has devoted to his work:—

"*gaviti miles
Zu se fabulos.*"

INCOMPREHENSIBLE POLITICIANS.*

The author of "Historical Recollections of the Reign of William IV." apologises, in his preface, for dwelling upon a period which has already occupied the attention of such well-known writers as Mr. Roebuck, Miss Martineau, and Sir Archibald Alison. For an eye-witness, and one having a personal acquaintance with some of the leading political characters in the Williamite era, no such apology is needed, provided the author is able to tell the public something not hitherto known, or that his position enables him to throw new lights upon past transactions.

Is the author a Whig, or a Tory, or does he belong to the new Irish party? He does not say, and we cannot venture to guess; but his work affords us the opportunity for stating a few facts of which Irishmen ought not to be ignorant. We are aware that the party has of late years grown amongst the Roman Catholics in Ireland, calling itself, *par excellence*, "the Irish Party," which shews, on all occasions, a disposition to conclave with the Tories, and oppose the Whigs, and yet is without Mr. Malay's abilities or learning to afford a plausible reason for the faith it professes, and the policy it pursues.

Mr. Malay, whether he is or not a member of the new "Irish Party," has written the ablest book that has yet been put forward in vindication of its policy; and we shall therefore take the liberty of calling attention to circumstances on which he has not dwelt, and of which the young "Irish Party" seems to be in absolute ignorance.

Instead of going back to the sixteenth or seventeenth centuries to discover the origin of the two great parties—Whigs and Tories—we shall at once come to modern times, to the generation that were men when William IV. ascended the throne, and who are now grandfathers. The generation of that day had grown up from infancy under the influence of a monarch under the domination of the Tories; for the Tory party had been in power from the year 1783 until the accession of William IV., with the exception of a few months in 1806, when the Whigs were in office, and when—the young "Irish Party" ought to be informed of the fact—the Whig party abandoned office rather than comply with the condition sought to be imposed upon it by George III., of renouncing for the future, its advocacy of the Roman Catholic claims to religious equality.

From 1783 until 1830 the Tory party was in power. What was the condition of the Irish Roman Catholics during the whole of that period? In a

review of Mr. Madden's "Lives and Times of the United Irishmen," we have shown what was the miserable condition of Ireland, and of the Roman Catholics in particular, previous to the session of the two Parliaments. The provisions made to the Roman Catholics by the Tories previous to the Union were perfidiously violated. The abortive insurrection, or rather, the five minutes' *insurrection* of Robert Emmet, in Thomas-street, Dublin, afforded a pretext for a renewal of the atrocities practised upon them in 1798 and 1799. As regards the poorer classes of the Irish Roman Catholics, the policy of the Tory party was ever the same. It was an unvarying system of ruthless cruelty. What was its conduct to the middle classes of Roman Catholics? The Roman Catholic newspapers, or Liberal-Protestant journals, advocating emancipation, were beset with prosecutions for libels. Journalists were crushed with scandalous fines and wasting imprisonment. For instance, the proprietor of the *Dublin Evening Post*, Mr. John Magee, was sentenced to two years' imprisonment and a ruinous fine. Mr. Malay ought, unless he was a boy when William IV. ascended the throne, to be old enough to remember that publishers were punished even with the pillory in the city of Dublin. The meetings of the Roman Catholics were beset with spies. British subjects were prosecuted by a Tory Attorney-General, and tried by a packed jury of Tory corporators, because they assembled together for the purpose of preparing a petition to Parliament for Catholic Emancipation. Roman Catholics were rigidly excluded from the corporations in towns; and in all cases of great importance they were shut out of the jury-box. They were, so long as the Tories were in office, treated as an inferior caste in their own country.

Such were the Tories in Ireland from 1783 to 1830. They proved themselves to be relentless foes to Irish Roman Catholics; and during the whole of that period the Whigs were advocates for Roman Catholic Emancipation; and in London supplied the office for the sake of the clients; and were at all times, during the reign of George III., of the Regency, and the reign of George IV., urging the concession of Catholic Emancipation upon the Crown, the Ministry, and Parliament.

The Roman Catholic Relief Bill received the royal assent in April, 1829; the Tories resigned office for nine months afterwards, and during the whole of that period the Relief Bill remained upon the Statute Book—dead letter! The Irish Roman Catholics were retained in the same condition of servitude and degradation in which they had been previous to its enactment. This was an inglorious policy, and produced its natural consequences. It was a display of justice from the Tories, as a party, that first originated the cry for a repeal of the Union; and all the agitation that for years afterwards distracted the empire.

Mr. Malay finds great fault with the Tories for this conduct; but he does not see very clearly, as we conceive, that when the Whigs came into office in England, the Tories continued in power in Ireland. On the contrary, he blames the Tories for what was then done by the Prime Minister of the Tories (the present Earl of Derby). We do not accuse Lord Derby of then wilfully betraying the party with which he professed to act, but though in name then a Whig, all his acts were those of a Tory. He placed Tories on the bench, his Attorney-General was a Tory—he sent a Tory as to take upon himself the odious task of opposing an address to the Whig Master of the Rolls, the illustrious John Philipps Curran. As a Tory, but calling himself a Whig, Lord Derby (then Mr. Stanley) patronised more but notorious Tories, and disavowed all in Ireland who had been previously acting with the Whigs, whether they were liberal Protestants or Roman Catholics. He was not, as the Secretary of Lord Grey, a Whig, or even a friend of the Whigs. His delight seemed to be to harass, thwart, and persecute all who had in Ireland been the sincere advocates of Whig principles. He was like the golden-drawn in the Lay of the Last Minster, when assuming the form of the young Buccuchin:—

"For so the Dwarf's lips are all grey,
And his shape that of that young boy,
He thought the Dwarf's mouth all grey,
The countenance of the young boy, such
He picked, and took, and overthrew,
Nay, some of them he overthrew."

The monument of Lord Derby's Tory policy in Ireland was the Reform Bill. Instead of enlarging the constituency, its operation was (as he was forewarned it would be), to diminish the number of the electors, and it diminished them so thoroughly and completely, that in 1832 there were only 72,460 parliamentary voters in a population of six millions!

With the downfall of Lord Derby as Irish Secretary for the Whigs ceased the reign of Tories in Ireland, which had prevailed over that country from 1783.

Under a Whig administration, the Irish Roman Catholics were first elevated to the rank, rights, and privileges of free men. No longer as the reign of the Tories was supreme and uncontrolled, they had been treated as serfs.

The young "Irish Party" seems to be ignorant of these facts; but fortunately the young "Irish Party" represents only a small noisy section of their countrymen, not the great body of the Irish Roman Catholic gentry, merchants, shopkeepers, and farmers. Those who deserve the name of "the people," are not forgetful that Whigs were their advocates when they were suffering—that Whigs sustained them when they were oppressed; and they well know that to the Whig party are they indebted for the change that has taken place in their condition—for their being, at this moment, in all things, on an equality with Englishmen. And no doubt they will, should danger threaten the empire, set like Englishmen with life and wealth—to prove they are attached to the British constitution—true and devoted; the loyal subjects of an English sovereign.

THE CORSAIR AND HIS CONQUEROR.*

ACCURATE, and therefore reliable information upon Algeria as a place of residence for persons afflicted with consumption, may be obtained in the book, *The Corsair and his Conqueror*, and how it is doing at Hyères, and hearing marvellous reports as to the climate of Algeria, with regard to its influence on chest complaints, he determined to

* *Historical Recollections of the Reign of William IV.* By A. J. Malay, Esq. Two volumes. London: J. F. Hoger, 1859.

* *The Corsair and his Conqueror: a Winter in Algeria.* By Henry E. Pope. London: Richard Bentley, New Burlington-street, 1860.

test what he had been told by his own personal experience. The results of his investigation are given in a work which he has entitled "The Corsair and his Conqueror: a Winter in Algiers." Independent of the hygienic information collected by Mr. Pope, his pages will be found interesting, from the insight they afford into the condition of Algeria as a French colony. The Gallic conquerors, it appears, are detested by the tribes they have subdued; and the feelings of the latter are strongly typified in the credence given to an old prophecy for some years current amongst them. The prophecy is to the effect, "that Algiers should be first stormed by the English, then taken by the French, and then retaken by the English, who were to occupy it permanently." Upon this prophecy the author observes: "The first two of these events have already been realized in the expedition of Lord Exmouth, and the battle of Sidi-Ferruch, and many of the native population are eagerly expecting the conclusion of the prophecy, to which they look forward with singular pleasure."

THE HEDGE IN THE GREEN LANE.

Uprais the hedge where I recline,
Screened from the sultry summer-shine,
I have a garden fair to see,
As good as the duke's, if it please me.
And there my flowers: the slim harebell,
With slender cups where the fairies dwell;
And the dewy daisy, crimson tipped;
As pure as a child, and as ray-tipped;
And golden-yellow, all glistening up,
The celandine, and the buttercup,
And the dandelion, with milky rings,
Coins of the mintage of the Spring;
And the pimpernel, that sleeps at noon,
Like an Eastern maiden flushed with June;
And the blue forget-me-not, flower of maidens
Who dream of love in the evening shades;
And the wild wood-strawberry, opening fair
Its petals five to the sunny air;
And the trailing ivy that braids and weaves,
And makes a carpet of its leaves,
Or climbs like a child to the garbled knee
Of the great, high-spreading old oak, tree;
And the woodbine, scattering sweet perfume,
And the mandarin-sweet, and the homie broom,
Dear to our hearts for a thousand songs
Of love's delight and lovers' wrongs;
And briary, cousin of the vine,
Up-climbing with its fingers fine,
And hanging from each sheltering tree,
Its garlands of embroidery,
With sea-green berries and twisted rings,
Fit for the diadems of kings;
But far more fitting and bright and rare,
As a wreath for childhood's forehead fair,
Twined 'mid the curls of its sunny hair.
And all these blooms in my garden grow,
All in this hedge where the wild winds blow;
And a hundred others as fair as they,
That I could count in a summer day,
Under the hedge where I sit alone,
Lulled by the bee with his trumpet tone,
And the blithe lark singing from the sky
My concert, and my lullaby.

MAPS OF SOUTH AMERICA.—A very valuable work has just been published by Messrs. Trübner & Co. The book is in the Spanish language, and its title-page may be thus translated:—

"A Collection of the Titles of all the Maps, Plans, Views, &c., relating to Spanish America, Brazil, and the Adjacent Islands, chronologically arranged, and preceded by an Introduction upon the Cartographical History of the same, by F. C. LACROIX, M.D., Ph.D., Professor of Chemistry in the College of Our Lady of the Rosary, &c., &c."

The title-page does not convey an accurate notion of the contents; for it is, in point of fact, an annotated catalogue of a vast number of maps, plans, &c., relating to South America. There is, for instance, a full account of 178 maps of America in its entirety; 84 maps of North America; 100 maps of California, Florida, and Texas; 285 maps of Mexico; 265 maps of the Antilles; 130 maps of Central America; 150 maps of South America in general; 130 maps of Guayana; 179 maps of New Granada; 53 maps of Venezuela; 20 of Ecuador; 193 of Brazil; 16 of Bolivia; 138 of Peru; 119 of the Argentine Confederation and Uruguay; 126 of Chili; and 126 of Patagonia and islands in the Pacific. The dimensions of these maps are in most cases specified, and any peculiarity in them pointed out and minutely described. This valuable work was commenced by its author in Brussels, then enlarged in Spain, and finally completed in Paris. It was prepared with a view to its use by the friends of the friendly aid and encouragement of the Messrs. Trübner. It is in these words the author, writing from Bogota, expresses his gratitude to the London publishers:—

"Mi amigo, el Sr. Trübner, me ha obsequiado no sólo por su generoso, valeroso, al fin, con sus tentativas mi deseo."

The publishers have conferred, not merely a favour upon a friend, but a benefit upon the public, in giving to the world this mass of information. We hope the success of his book may be equal to its merits. If it were translated into English, we would recommend it as a valuable addition to the library of every literary institution in the British empire.

NECROLOGY OF EMINENT PERSONS.

SIR HENRY GEORGE WARD, G.C.M.G.

Sir Henry George Ward, Knight, Governor of Madras, only son of the late Robert Plumer Ward, of Gilston Park, Hert's, Esquire (author of "Tremaine," and other popular works), by his

first wife, Catherine Julia, daughter of Christopher Thomas Maling, of West Herrington, Durham, Esquire. Born February 27, 1797; married in 1824, Emily Elizabeth, second daughter of Sir John Swinburne, Bart. He was Charge-d'Affaires to the Republic of Mexico from 1825 to 1827, and afterwards joint Plenipotentiary for the treaty of commerce with that

state. In 1840 he was appointed Lord High Commissioner of the Ionian Islands, and received, according to usage, on that occasion, the Grand Cross of the Order of St. Michael and St. George. In February, 1855, he was appointed Governor and Commander-in-Chief of the island of Ceylon, from whence he had just arrived at Madras, to the government of which he had succeeded on the recall of Sir Charles Trevelyan, when he was attacked by cholera, and died on the 2nd of August. Sir Henry was proprietor of the *Weekly Chronicle* newspaper, from its establishment till May, 1840. In the House of Commons Mr. Ward sat for several years as representative for St. Albans and Sheffield, and attracted considerable attention by his speeches on "the Abuses of the Irish Established Church." His mission in 1834, for the appropriation to secular purposes of the surplus funds of the Church, led to the breaking up of the Grey administration.

THE DOWAGER LADY RIVERS.

Thursday, September 5th, at Rushmore Lodge, Downshire, the Right Hon. Frances Barends Rivers, only daughter of the late Lieut.-Col. Francis Hales-Birby, of Mistley House, Essex, born in 1756, married February 6th, 1808, Horacio Williams, third Baron Rivers, by whom she leaves surviving issue — 1. The present Lord Rivers; 2. Lieut.-Col. the Hon. Horace Pitt; and 3. The Hon. Harriet Elizabeth, wife of Charles Dashwood Bruce, Esq.

THE LADY ADELA IBBERTSON.

Tuesday, September 4th, at Osterley Park, near Hanwell, the Lady Adela Cornelia Maria, youngest daughter of George Child Villiers, fifth Earl of Jersey, by the present Countess Dowager of Jersey. Born March 25, 1828; married November, 1846, Captain Charles Parke Ibbertson, then of the 11th Hussars. Within the brief period of twelve months the Countess Dowager of Jersey has been bereaved of her husband, George (fifth earl), her eldest son (sixth earl), and her only remaining daughter, the Lady Adela Ibbertson.

THE COUNTESS MANVERS.

Friday, Sept. 8th, at Throbury Park, Nottinghamshire, the Right Hon. Mary Letitia, Countess of Manvers, eldest daughter of the late Anthony Harlegh Eyre, of Groby, in the same county, Esq.; born October 11th, 1781, married at Grove, August 23rd, 1804, Charles Herbert Pierrepont, the present Earl of Manvers, by whom she leaves surviving issue — 1. Sydney William Robert, Viscount Newark; 2. The Lady Mary, wife of the Hon. Edward Egerton, M.P.; and 3. The Lady Anna Charlotte, wife of Charles Watkin Williams Wynn, Esq., M.P.

THE RIGHT HONOURABLE JAMES WILSON.

The Right Hon. James Wilson, Financial Member of the Council of India, born at Hawick in 1806, married, in 1832, the daughter of William Preston, of Newcastle-upon-Tyne, Esq., by whom he has left a family of nine daughters. Mr. Wilson was originally engaged in business; but meeting with misfortune, and having a large family to provide for, he established, in 1843, *The Economist* newspaper, in which he advocated with great energy and ability the principles of Free Trade. In 1847 he obtained a seat in Parliament as member for Westbury; and in May, 1848, was appointed a Secretary to the Board of Control. In December, 1852, he became, under Lord Aberdeen's Government, Secretary to the Treasury. In 1857, he was elected M.P. for Dorchester; and in June, 1859, Vice-President of the Board of Trade and a Privy Councillor. In the August following he was sent to India as Financial Secretary, where his health becoming seriously affected by the climate, he decided to go to a Hill Station; but his strong sense of duty inducing him to remain on the scene of his labours, he was attacked by acute dysentery, and died at Calcutta on the 11th ult., in the 55th year of his age. Mr. Wilson was the author of several pamphlets on the late Corn Laws, Currency, Banking, and other political and financial subjects.

CARLETON'S NEW WORK.

Now ready, at all the Libraries, in One Volume, crown 8vo., with 12 Illustrations, by Fitzpatrick, price 10s. 6d.

THE EVIL EYE; OR, THE BLACK SPECTRE. A Romance. By WILLIAM CARLETON, Esq. Author of "Traits and Stories of the Irish Peasantry," &c. &c.

THE IMPROVED PATENT HARMONIUMS.

MANUFACTURED BY ALEXANDRE & SON, OF PARIS.

CHIEF WHOLESALE AGENTS: METZLER & CO.,
37, 38, & 35, GREAT MARLBOROUGH STREET, LONDON,—W.

ALEXANDRE'S HARMONIUMS are universally admitted to excel all others in durability, and in the power and quality of their tone; and as they rarely require tuning, and give no trouble in their management, they are coming daily into more general use.

The following is a complete List of all the Instruments manufactured by them, forming a large Assortment, suitable for either the Church, School, or Drawing-Room.

WITH THE PATENT PERCUSSION, OR PIANOFORTE HAMMER ACTION.

The invention of the PATENT PERCUSSION ACTION has entirely removed the sole objection to these admired instruments—namely, the rapidity of articulation when used for French Music. It consists of a set of Hammers which strike the Vibrators at the same moment that the air is admitted, thus facilitating the execution of the most brilliant and rapid passages, and also producing a fuller and very superior quality of tone, and imparting to this instrument all the advantages of the Pianoforte.

CONSOLS INVESTMENT DEPARTMENT.

CONSOLS INSURANCE ASSOCIATION,

FOR RECEIVING INVESTMENTS OF LARGE OR SMALL SUMS OF MONEY, AND FOR EFFECTING LIFE INSURANCES,
ON GOVERNMENT SECURITIES.

INCORPORATED PURSUANT TO ACT OF PARLIAMENT.

VICE-PRESIDENTS.

The Right Honourable Lord KRAKE, Stetchworth-park, Newmarket.
Lord CLAUD HAMILTON, M.P., Eaton-square.

The Right Honourable W. F. COWPER, M.P., Curzon-street, Mayfair.
THOMAS MANN, Esq., General Registrar-office, Somerset-house, London.

TRUSTEES OF THE CONSOLS LIFE INSURANCE FUND.

Dr. SOUTHWOOD SMITH, The Pines, Weybridge, Surrey.

AUDITOR OF THE CONSOLS LIFE INSURANCE FUND.

Dr. FARR, Registrar-General's Office, Somerset-house, London.

DIRECTORS.

Major JAMES ADAMS, 16, Royal Crescent, Nottingham.
JOHN DAVID BAKER, Esq., 45, Theobald-square, Birmingham.
The Rev. WILLIAM BLAIR, 6, Angel-road, Brighton, and Westwick Lodge,
Worthing.
HENRY CLARA, Esq., M.D., F.S.A., Milland-house, Southampton.
NICHOLAS DESNYS, Esq., F.R.S., 48, Devonshire-road, Holford.

HENRY WILLIAM FULLER, Esq., M.D., 13, Manchester-square.
LAWRENCE LAWRENCE, Esq., Grange Villa, Dulston.
PETER MORRISON, Esq., 41, Purchase-square, Hyde-park.
JOHN WILLIAM WILLIAMS, Esq., 8, Serle-street, Lincoln's Inn, and
4, Gloucester Villas, Paddington.

MANAGING DIRECTOR.

THOMAS H. BAYLIS, Esq. (to whom all communications should be addressed).

AUDITORS.

Messrs. COLEMAN, TERQUAND, YOUNG, & Co., 16, Tokenhouse-yard, City.

MEDICAL ADVISER.

Dr. FULLER, 13, Manchester-square.

SOLICITORS.

Messrs. BENHAM & TYNDALL, 18, Essex-street, Strand.

ACTUARY.—GEORGE SCOTT, Esq., F.I.A.

EXPLANATION.

THE CONSOLS INVESTMENT DEPARTMENT is a safe and eligible channel for investing Large or Small Sums of Money, withdrawable in full, at short notice. The advantages the Department presents are, (1) that the sums invested are protected by the Security of an extensive Association, composed of several hundreds of responsible Shareholders; (2) that Five per Cent. per Annum

Interest is paid; (3) that the Investments are not subject to fluctuations of any kind; (4) that by an arrangement peculiar to the Consols Investment Department, each Sum Invested becomes Active instead of Passive Capital, as in most Monetary Institutions.

CONSTITUTION OF THE ASSOCIATION.

The Association is incorporated pursuant to Act of Parliament, and is authorized to extend its capital to FIVE MILLIONS STERLING.

It possesses a large and continually increasing body of responsible Shareholders, consisting of several hundreds of parties, who have executed the Deed of Settlement.

The liability of the Shareholders is limited to the amount of capital subscribed.

The Association is empowered to effect Life Insurances on Government Securities, to grant Annuities, to receive Investments of Money at Interest, withdrawable at short notice, and to make advances on First-class Securities, in connection with Life Insurance.

The Association undertakes all these profitable branches of business, which are kept distinct from each other.

INVESTMENTS.

Investments varying from Five Pounds upwards, withdrawable at Six Months' Notice, or on the expiration of a given number of years, are received by the Association.

The rate of Interest allowed on Investments, withdrawable at Six Months' Notice, is Five per Cent. per Annum.

Investments made for a term of years are received on more favourable terms, dependent on the current value of money from time to time.

No expense is incurred by investors on making Investments.

Forms of Proposal for Investment are furnished by the Association, Free of Charge.

Money intended for Investment may either be lodged at the Branch or Chief Offices of the Association, 429, Strand, London, or be remitted direct to the Managing Director, by Half-Notes, Bankers' Orders, or Post Office Orders made payable at Charging Cross Post Office.

FORM OF SECURITY GIVEN TO INVESTORS.

The Securities Investors receive for their money are Consols Debentures guaranteed by the whole body of the Shareholders in the Association, by the Directors, and bearing the Corporate Seal of the Association.

The Debentures secure the full Amounts Invested, as well as the Interest.

Consols Debentures are First Class Financial Securities, bearing Five per Cent. per Annum Interest. They can be transferred from one person to another by

simple endorsement, like a Bill of Exchange, entitling the HOLDER to receive the Interest and Principal Sum on giving the proper notice.

By this arrangement Investors are enabled to lodge Money with the Association, bearing Interest day by day, and they can employ the Debenture issued by the Association as positive Security in Financial Operations. To parties engaged in Trade, or who are likely to require money at short notice, this advantage will be of paramount importance.

EMPLOYMENT OF FUNDS.

The Funds of the Consols Investment Department are employed in First Class Securities, by making advances to respectable parties in connection with Life Insurance.

Besides making advances to Landowners and others, under the Encroachment Fund, for Improving Estates, purchasing Property, &c., the Association finds abundant employment for Capital on perfectly safe Securities.

The Lending Conditions on which the Association makes advances are—1. That the Security in each instance is ample for the advance. 2. That the Rate of Interest is remunerative. 3. That a Life Insurance forms part of each transaction. 4. That the period within which the advance is to be repaid is limited to a reasonable term.

CONSOLS LIFE INSURANCE DEPARTMENT.

A separate and detailed prospectus of this department, with Tables of Rates, a Valuation Table for determining the Values of Policies, examples of the Consols System, and full information have been prepared, and may be had on application, either personally or by letter, addressed to the Managing Director, at the Chief

Office, 429, Strand, London; or of any of the Agents of the Association in the United Kingdom.

Applications for Shares, Agencies, Forms of Proposal, and information respecting the general business of the Association, are requested to be made, either personally or by letter, to the Chief Office, 429, Strand, London.

THOMAS H. BAYLIS, Managing Director.

"UNA" AND THE LION.

THE popular cry at Naples, and everywhere throughout Italy, is, "Una!" "Una!" The Genoese and the Neapolitans, who differ as much from each other in moral and mental characteristics as the Saxons and Celts of our own islands, are possessed, together with all the intermediate Emilians and Romans, with one enthusiasm for the one object—the Unity of Italy. "Una," the fair Italian maid—interesting as her namesake in the "Fairie Queen"—walks, like her, through perils so manifold, that the whole world is smitten by her beauty and distress. The question is, will that grim Lion, the Emperor of the French, the only foe that the poor damsel has to fear, turn and rend her! or will he crouch at her feet as tamely as his prototype in the immortal allegory! Time will unfold the secret. In the mean while, although the *Lion Grylls*, it is doubtful whether he will bite. No one knows the secret of his intentions but himself. It seems probable, however, that the displeasure of the lordly brute, if not exactly an idle make-believe, is a piece of acting, to secure, not the fair Una herself, but some of her treasures—such as Genoa and the island of Sardinia. The peace-loving people of France would certainly have no objection to either *bonnes bouches*. They have tasted Nice, and have quite stomach enough for Genoa. They possess Corsica already, and the map of France would look more perfect if Sardinia were painted in—with outlines of the same colour.

The occupation of the States of the Church, by the armies of the King of Italy—(we may as well give him his full title at once, and drop that of King of Sardinia, which has become about as appropriate in his case as that of Queen of the Isle of Wight would be for our own sovereign)—has drawn upon himself a diplomatic reproof. There is no longer a French Ambassador at Turin. But Victor Emmanuel can afford to take this little rebuke without groaning or even wincing. The chastisement will not hurt him much, if at all. His friend Napoleon, finding fault with him for invading the dominions of the Pope, is in the position of Satan, when he rebuked him. Satan, in that case, had his own little hypocrisy to serve, and so has the Emperor. If it be wrong for Victor Emmanuel to invade the territory of the Pope in 1860, on the plea of the liberation of Italy, it was equally wrong for Napoleon III. to invade the territory of the Emperor of Austria in 1859, on the same pretence. But great sovereigns only take account of the logic of words when logic happens to be on the side of their own ambition. At all other times they scorn it, or stick by the more powerful logic of swords, which, in a material and illogical world, is the more certain and satisfactory policy.

Garibaldi is—as he was last week—the master of the situation. Though the King of Italy has gallantly, and, as we think, very wisely, adopted the cause of Garibaldi and the Revolution as his own, and endeavoured to step into the first rank—to which he is entitled, and which Garibaldi does not dispute with him,—the whole world admits that Garibaldi, by dint of honesty and singleness of purpose, remains the ruling spirit. He neither is nor desires to be a king; but he is, by moral force, the virtual lord and Sovereign of Italy. It is he and the Emperor of the French—and not Victor Emmanuel and the same potentate—who are pitted the one against the other, in one of the most remarkable conflicts the world has ever seen. Either of them may make a false move in the mighty game. But in this, as in all other games, the excited player has fewer chances than the cool

one. We should say, therefore, to Garibaldi, if we could hope that our words would reach his ear, that although audacity answers great purposes, it does not answer all. Audacity and Garibaldi have conquered Sicily and Naples; but Audacity and Garibaldi will not conquer the French Emperor, if he determine to throw his whole strength into the support of the Papacy. If the Emperor did so, not Garibaldi, and all Italy at his back, could shake him in the encounter. It is a brave saying and a brave boast—worthy of a hero,—to declare, as Garibaldi has done, that he will proclaim the Unity of Italy from the steps of the Quirinal. But to do this he must defeat, not only one French army—true to its colours and staunch in its allegiance—but all the armies that France could and would pour into Italy. This would be an undertaking which, if not impossible, is so very difficult, that Garibaldi may, without the slightest imputation upon his patriotism or his courage, be content with brave words, without following them up by rash deeds. At present the Emperor of the French is in a false position; and if Garibaldi, who is in a true position, will humour him a little, and make allowances for the superstition of the French peasantry and the French *curés*—who, quite as much as the army, maintain Napoleon III. upon the throne,—he may secure the real Unity of Italy, at an earlier period, and at a much less cost, than if he drew French blood in the struggle. Circumstances will in due time reduce the territorial dominion of the Papacy to a very attenuated and gradually vanishing minimum, without diminishing the real Unity, or assuaging the solid Independence of Italy. It is one thing to run amuck against a despotic imbecile like the ex-King of Naples, but a very different thing to oppose by force of arms the policy of such a very strong man as the Emperor of the French, who has home prejudices as well as foreign reasons to satisfy, and who may find the support of half a million of soldiers to be very fragile and uncertain, unless it be flanked and buttressed by priestcraft and the religious sentiment of the masses of his people. "Una" will have the Lion at her feet by and by, if she will but be patient.

Altogether, the affairs of Italy at the present moment exhibit a very decided *imbroglio*. But they have not yet rotted into a *fiasco*; and it only requires a little forbearance, as well as audacity, to put order into them. There are five great actors on the stage: Garibaldi, Victor Emmanuel, the Emperor of the French, the Emperor of Austria, and the Pope. It is in the power of the first and the last to exalt one of these to the proper position all Italy expects him to occupy, and to reduce the opposition of the other two within manageable limits. Pio Nono began his papal career as a reformer. If he would but coalesce with Garibaldi, and crown Victor Emmanuel King of Italy, in St. Peter's, he might not only do good service to his friend Napoleon, by helping him out of a difficulty, but he might preserve the Papacy and the States of the Church for two or three generations longer. Such a result is surely better than dingy exile to the castle of Avignon, or a splendid, but uncomfortably, banishment to Jerusalem.

As for the Emperor of Austria, and the great question of Venetia, if the Quadrilateral is so desperately strong, and Austria so desperately needy, why should not "Una," that rich virgin, buy the little corner at a fair price! Austria may refuse to be driven out—and "small blame to her,"—but she might be very glad to be bought out. The women of Italy would sell the jewels, and the men would cheerfully tax themselves of the tobacco and all their other luxuries, for a

twelvemonth, for such a consummation. Ten millions sterling would be no great price to pay. Let "Una" make Austria the offer. We fancy that it would be gladly accepted; and it would be cheap for Italy—in blood as well as in money.

RACE AND CREED:—THE ORANGE DEMONSTRATIONS IN CANADA.

THE Duke of Newcastle—the first colonial minister who has ever visited a British colony—will not return from Canada with the belief that the Canadians are altogether so happy a family as they have been represented. In Canada, as elsewhere, a large infusion of the Irish element into a population seems to be the best possible assurance of future riot and antagonism. The demon of Disunion appears to follow in the wake of Roman Catholic Irishmen as a shark is said to follow a ship with a fatal disease on board. No sooner have they set foot on new soil, than the "boys" go in for a row, no matter the object—Pope or politics, a mass or a majority, St. Patrick or the Prince of Orange. A shindy—not "love"—is the sort of a mate Irishman—an idea which Irishmen endeavour everywhere to demonstrate. In the United States these demonstrations may be said to be slightly international. In Canada it is—if it be not a "ball" to any—it is—the same, with a difference. The French Canadians—forming the majority of the people of Lower Canada—are Romanists, and with them the Irish Papist has no quarrel about creed. It is not so in the Upper Province, where the population is strongly Protestant. Of this population some 80,000 are said to be Orangemen, embracing Protestant English, Irish, Scotch, and Germans. Here, as a consequence, the Irish Roman Catholic is at once met in that most implacable of all spirits—the hatred which springs from religious feuds of long standing, and, as may be supposed, no little heart-burning, and some jostlings and struggles, both physical and political, occasionally arise. These, it is true, are never of very serious character, as they mostly vent themselves in newspaper scurrility; or, at the worst, in a tap-room fight. It is not to be denied, however, that the feeling is more than sufficiently rancorous. There is, however, generally enough of respectable moderation to restrain the violence of the more active partisans.

The visit of the Prince of Wales, which ought to have been an occasion for the decent oblivion of all such feelings of rancour and disunion, seems, on the contrary, to have excited them to unnatural activity. But the crimes are not so wholly religious as might at first glance be supposed. Various circumstances have conspired to throw the balance of power in United Canada into the hands of the French Roman Catholic party—the Lower Canadians. At all elections this party is sustained by its Irish co-religionists, and thus united, the two have been able to seize, and for years to retain, the reins of government. The Protestant majority of Upper Canada—which in the population of the United provinces cannot be less in excess of the ruling minority than four hundred thousand—find this yoke almost more than they can tolerate. Perceiving that creed and nationality are allied for the purposes of their political depression, and for the subversion of those principles which it is their desire to maintain, the Protestant Upper Canadians have resorted to the weapons of their antagonists, and have met party by party, race by race, creed by creed. We do not seek to vindicate but only to explain the circumstances, and to show the people of this country that the Irish Roman Catholics in Canada have been the aggressors, and that, had it not been for their unwise political tactics, Orangemen would have been as unknown in Upper Canada as it is in England or Scotland.

A correspondent, whose Orange sympathies are not disguised, sends us the following history of the very unfortunate outbreak of party zeal which has clouded the sunshine of the Prince of Wales's visit, and done so much to deprive it both of its grace and its utility:—

"The visit of the Prince of Wales to Kingston—the old capital of Upper Canada—was expected to take place on the 4th of September. It should be known, in order to rightly understand the untoward quarrel which has broken out, that notwithstanding there is here a college under the government of the Romish Church, the inhabitants of the city are not only Protestant, but the town and country around are strongly Orange. Unwisely, as we cannot but think, the Orangemen resorted on welcoming the Prince with triumphal arches, adorned with flags and banners, and all the emblems and motives of their association. This was so distasteful to the Roman Catholic convent in Regina College, that an appeal was made to the Duke of Newcastle, who ultimately refused to permit the Prince to land, or to countenance 'any party demonstration.' The Prince did not land at Kingston accordingly. Many thousand pounds were uselessly expended in preparation, many thousands persons were disappointed, and such a shock given to the nervous system of the body politic of Upper Canada as may take all the doctors of Downing street many years to remedy.

"From Kingston the Prince, with his suite, proceeded to Belleville, some forty miles further up the St. Lawrence. Belleville is one of those places of rapid growth known only on the north-western shores of the Atlantic. It, too, is especially Protestant; and the Orangemen, who are numerous throughout the

district, had made preparations to receive their royal guest with all honour. The town, however, had gone forth, and like their brethren in Kingston, they were required to withdraw their emblems, to lay aside their distinctions, or not to join in the procession. They adhered to their own expiation of their loyalty in preference to that of the Duke and the Roman hierarchy. The Prince did not land at Belleville, in consequence. Toronto, the capital of Upper Canada, and, until last September, the seat of government, is a city of some 50,000 inhabitants. In it is situated the educational establishments of the country—the Normal Schools, and the University and Trinity Colleges. Here, also, the Orange Association had designed, at considerable cost, to evince their attachment to those principles for the maintenance of which they had combated, and upon which they had supposed the constitution they and their fathers had so long cherished was based. It was arranged that at this point a general muster was to be made, in order to give to their future king assurance that the spirit which triumphed at the Boyne existed in this distant portion of the empire available for a like emergency.

"There is, moreover, another unfortunate circumstance. The laying of the first stone of the parliament buildings at Ottawa, on the 1st instant, also gave occasion to what may be viewed as the exercise of a discourteous and arbitrary power. The order of Freemasons assembled at Ottawa, under the impression that they, as usual on such occasions, were to take part in the proceedings. Upon their arrival on the ground in their regalia, they were *brusquely* informed they would not be permitted to interfere; that the Prince would perform the ceremony without their assistance; and that they might, therefore, lay aside their appliances. With much good taste, they quietly did their 'aprons and jewels,' and became ordinary spectators. The calm, however, did not prevent a storm. It was soon perceived that a very unnecessary offence had been given to a highly-respectable body of men, many of whom had come hundreds of miles to honour the occasion; and it was thought that an invitation to lunch with the Prince would heal the sore. The pill was not taken; and it is to be regretted that the same propriety which characterised their early disappointment did not mark their refusal of the invitation. It is said the notes containing it were returned unopened. Mr. Harrington, the Grand Master for Upper Canada—a man much respected among Masons, as by all who enjoy his acquaintance, is also Deputy Receiver-General of the province, and, as we learn, was told, with an amount of indiscretion which the irritation of the moment can hardly excuse, that he must see the refusals instantly withdrawn, and that the Masons appeared at the lunch, or the position he held in Her Majesty's service would be jeopardised. The main reply was that the commission he held was at the service of the Government whenever it was required, but that he should support the becoming dignity of the craft."

Whatever difference may exist respecting the Orange difficulty, none can be entertained respecting the Masonic one to which our correspondent refers. The policy of such discourtesy, to use no harsher term, in a community where a certain amount of democratic license cannot be ignored, and which no amount of oligarchical chicanery can subvert, is surely of very questionable wisdom on the part of the Duke of Newcastle. We cannot share the feeling of our correspondent, that it was right for the Orangemen of Kingston—even supposing they had a provocation from their Roman Catholic opponents—to act as they did upon an occasion which they ought to have combated with their Irish and Roman Catholic fellow-subjects to make an auspicious and agreeable one. We in England, who have outgrown such quarrels of creed and race, feel inclined to say to Canadian Orangemen as to Canadian Papists—"A plague on both your houses! Can you not enjoy your liberty like honest and sensible men, and cultivate the New World without importing into it the senseless animosities of the Old?"

THE INTERVENTION IN SYRIA.

IN this journal, we have stood almost alone among our contemporaries in denouncing the horrible barbarities committed both by the Druses and the Maronites, as having been instigated for ulterior purposes by Powers that were hostile to the Sultan, and desirous of expediting the overthrow and partition of his empire. Recent disclosures are beginning to prove that we were correct, and that the barbarous Druses, and the equally barbarous, though half-Christian, Maronites, were mere puppets, set in motion by cunning hands in Russia, if not in France. It is clear, from the letter of "The humble Seraphim, Bishop of Tyre and Sidon," just published, that the Maronites received instructions through him, and through a superior authority, whom he calls "His Holiness, Our Lord, the Exalted Patriarch," to commence a war of extermination against the Druses; and that the latter, knowing the day fixed for the execution of this plot, anticipated it, and inflicted upon the so-called Christians the pent-up vengeance of ages of civil and religious strife.

It would be no loss to civilization, and but little to humanity, if Druses and Maronites realized in their squabbles the old story of the Kilkenny cats, with which every one is familiar; in which case perhaps the Baron Rothschild, Sir Moses Montefiore, and other wealthy Hebrews, might buy the country at a cheap rate from the Sultan, and gather the children of Israel to their old home, and the birthplace of their fathers. But since this is not the case, and as the Druses and Maronites will continue to inhabit the land, which both of them disgrace,—it is satisfactory to learn that the Sultan has been able to vindicate his authority in the province, and to visit the Druse assassins with the condign punishment which they

merit, without the aid of the French army, despatched thither with such undue precipitancy at the first news of the massacres.

The best thing that the French Emperor can do under the new circumstances, created by the ruthless but much needed energy of Fud Pacha, is to recall his troops without further delay. Their presence in Syria, or on its coasts, weakens the authority of the Sultan—exhibits him to his subjects as incompetent for the performance of his duties, and excites the dissatisfaction in every part of his dominions. The whole business has been a miscalculation from first to last, on the part of its too cunning and too eager promoters; and in the interest of France, as well as in that of the peace of Europe, which the Emperor declares he has so deeply at heart, the French troops should be forthwith ordered home. The Sultan can evidently manage his own affairs, as far as Syria is concerned; and to thrust aid upon him at this moment is to do him an injury.

BACKSLIDING AT MANCHESTER.

THE new joint-stock company contemplated at Manchester to promote the growth of cotton, for its chief object to buy cotton in India of an improved quality, and ship it to this country. The Government is said to have promised to assist the project by grants of land, by securing a supply of labour, and by protecting the interests of the company. To promote the prosperity of India, is the duty of the Government; and English capitalists cannot employ their capital more honourably than to enrich India and increase the supply of cotton. The objects are excellent, and every one must wish that they be attained.

But why should the chief spokesman of the company, a member of the Legislature, and foremost man of the Anti Corn Law League, have departed from these objects at the late public meeting, in order that he might say something invidious of America! Most justly did Mr. Bazley expatiate over the greatness of our cotton manufacture, and point out the number of people employed by it, and the vast wealth it produces. The marvel, however, of it was, he explained, that this immense trade has all come into existence within a century. But by what means did it grow into existence! The State never patronised or protected it, except as it protects property. It grew up from the inventions of Watt, Hargreaves, Compton, and others,—from the coal and iron under the feet of the men of Lancashire and Staffordshire,—and from the general want of clothing. No efforts, such as this company is to make, nourished it into existence. The energies of individuals in Lancashire seeking their own advantage, accomplished the magnificent work. All their exertions and ingenuity would, however, have been unsuccessful,—all the coal and iron would have existed in vain,—but would not have called our cotton manufacture into its present vastness without an adequate supply of the soft vegetable wool which Nature has destined for our clothing, as she has destined iron for tools and coal for our fires. And how has the raw material of this great manufacture been hitherto obtained!

Last year, according to Mr. Bazley, we used 1,000,000,000 lbs. of cotton, and of this 800,000,000 lbs. came from the United States. But, however suitable may be the climate of the Southern states to grow cotton—and it is peculiarly suitable, as almost all tropical regions are—"Cotton," according to Mr. Bazley (which is doubtful), "was not indigenous in the States." By the exertions, then, of the Americans using, in common with all the European colonists of the tropics, "imported labour," the bulk of the cotton for the gradual increase of our manufacture has been supplied.

The few hundred thousand pounds of cotton we required more than a century ago came from the East and from the European colonies of the Antilles. But these countries, which generally cultivated sugar in preference, or lacked the spirit of improvement, did not increase their growth of cotton. The energetic Americans did. They saw what was wanted in Europe. They invented the gin for clearing the wool from the pods, and they soon understood the cotton-growers of all other countries. Just as we, by our ingenuity and exertions, have under-sold almost all other countries for the manufactured article—even going far to extinguish the native manufacture in our Indian possessions, and have become the chief clothiers of nations—so the Americans have become the chief producers of the raw material. After their success, cotton could not be profitably grown elsewhere for our markets; but never since they entered into this business has there been anywhere, for any considerable period, a serious deficiency. The price, as Mr. Bazley admits, has become "very moderate indeed," from having been exorbitantly high, and the supply, instead of being precarious and uncertain, has become so equable, that the annual and certain increase and steady prices are securely relied on.

Our cotton manufacture, then, is as much due to their exertions for supplying us with the raw material, as to the exertions of our own miners and their spinners. For nearly a century, too, has this combined system grown harmoniously in its several parts, and human experience seldom finds a longer warranty for the continuance of any system. Incessantly has the growth of cotton increased in the States,

and is increasing as the manufacture of cotton has increased and is increasing in England; incessantly have more and more people been employed in the business in the two countries, and incessantly has the welfare of both been steadily augmented in union; but while in this progress there has been no change, every political state of Europe—but our own—has been subverted. And even our state has undergone numerous, great, and unexpected changes. We have good reason, therefore, in the past, for relying on the future; and without making any peculiar efforts hereafter, any more than heretofore, may securely calculate on the continual increase in the supply of cotton from America. It is equally essential to the prosperity of both nations.

With such facts, known to all the world, and especially well known at Manchester, it is grievous to find a gentleman like Mr. Bazley, and others, losing their reliance on the course of events, and fancying that the supply of cotton will fall short, if they do not look after the growth as well as after spinning and weaving. Because the Queen's dominion extends over India, the gentlemen of Manchester are to become cotton growers, as well as cotton manufacturers. Mr. Bazley excited the envy of his auditors by telling them that the Americans would probably receive £50,000,000 in the coming year for cotton which he implied could, with more advantage to us, be obtained from British India. At the same time he described the few millions of slaves in the United States as not great consumers of British manufactures, thus exciting prejudice against the States, both on account of what they were to receive, and what they would not take. He calculates on "receiving a legitimate and more extensive return trade from India than from any other country." Facts do not warrant the supposition. India has been peopled for ages, and the population of the States has grown into existence within a brief period. With India we have been connected by trade for upwards of two centuries, and last year the value of our trade imports and exports together with the two countries was as follows:—

| | 1859. | India. | United States. |
|--------------------|------------|--------|----------------|
| Imports from | 15,246,808 | | 34,281,860 |
| Exports to | 19,863,999 | | 23,601,033 |
| Total | 35,079,003 | | 56,885,963 |

Thus the trade with India last year, when it was much increased by our own great expenditure there, was nearly 40 per cent. less than our trade with the United States. The latter, too, is continually increasing, without any effort on our part, while the former still requires to be fostered, and, whatever exertions we may make, is not likely to keep pace with our ever-growing trade with the States. To murmur at the States supplying us with cotton is to treat their great exertions with ingratitude, and be discontented with our best customer. Such sentiments, as expressed by Mr. Bazley, find their counterpart in some patriots of the United States, who only agree with the backsliding gentlemen of Manchester when they demand high tariffs to encourage the manufacture of cotton and iron at home, in preference to importing them from us. How can we be surprised at the slow progress of economical truth abroad, when so many examples are supplied day after day that it is going backwards at home! It is clearly possible to encourage trade with India, and promote the cultivation of cotton there, without depreciating trade with the United States. In Manchester and Liverpool Mr. Bazley's course must appear preposterous; and probably the knowledge that such a course would be taken by the gentlemen who promote the formation of the company accounts for the fact, regretted by Mr. Bazley, that "few gentlemen actually representing large spinning and weaving establishments of the district" were present at the meeting.

BRITISH PERPLEXITIES:—WHAT TO DO! OR WHAT NOT TO DO!

GREATNESS brings with it so many cares and responsibilities, which it is the fashion for the favourites of fortune to bewail, in a somewhat affected strain, their success, and envy the poor cotter, whose troubles are confined to domestic life. England is in this position. She is a first-class Power, but if there ever was a time when she might be justified in having a sigh over her greatness it is the present.

We might, for the moment, almost wish ourselves Homburg or Nassau, with our national finances depending on the success of a Gaming Table, and our foreign relations confined to the distinguished visitors from abroad who frequent it. Unfortunately we are expected, just at this moment, to take a leading part in European politics, and are in a state of profound perplexity as to what that part is to be. The principal characters of the piece have been already cast. Garibaldi is the dashing hero; Louis Napoleon the successful intriguer; with the Emperor of Russia, Kossuth, Abd-el-Kader, Cavour, and a host of others as his minor instruments. The Sultan, who has been plentifully drugged, is asleep in one corner of the stage; in another, the Emperor of Austria is on his knee before the Prince Regent of Prussia, demanding protection. Britannia, meanwhile, wanders

vaguely about, her right hand literally not knowing what her left is doing; first she pours a pocketful of sovereigns into Garibaldi's cap; then she puts the Austrian Emperor on the back, and tells him to be a man; then sticks pins into the old Turk, in fruitless endeavours to wake him; accepts any insult from the Emperor of France, and passes them on to the Prince Regent of Prussia; finally, we presume, she will take refuge in the last resource of her sex, and sit down and cry. Seriously, if we are to maintain our position as a first-class European Power, we must adopt a decided course of policy, and carry it out. Either we should withdraw from all interference whatever in continental affairs, or throw ourselves decidedly into the contest upon one side or the other. Our present shuffling and uncertain policy, for which the nation and not the Government is responsible, draws down upon us universal contempt. We have denuded ourselves of friends in every direction.

The despotic Governments of Europe detest us, because we lecture them dogmatically upon their system of government generally, contriving to season our discourse with a dash of impertinence; the nationalities of Europe despise us, because, while we offer them a barren sympathy, we are generally found, at the last moment, supporting the Sovereigns whom we have previously insulted. At the present juncture three decided courses are open for adoption: first, total abstinence; secondly, a decided and thorough support of existing governments, irrespective of the principles upon which they govern; thirdly, the out-and-out espousal of the revolutionary cause throughout Europe. Each of these courses present serious difficulties and objections. To adopt the first would be, for the present, at all events, to forfeit our position and influence on the continent, and to destroy, at one blow, the structure which has been raised by the wars and diplomacy of years. It is just possible that the sacrifice may be worth making, for the sake of peace. And there are those who maintain, with much plausibility, that a policy which would thus ensure tranquillity to the nation would so surely advance her material prosperity that in the end we should have no cause to complain of having voluntarily withdrawn from taking our share in the councils and contests of Europe. On the other hand, by such a policy, if we leave ourselves without enemies, we deprive ourselves of the possibility of having friends; we become no longer necessary to the balance of power, and no one Power has therefore any interest in preventing a combination being formed in Europe which it would be impossible even for our navy to resist, and which should at last involve us in a war far more expensive and perilous to the national honour than those in which, in alliance with other Powers, we might at an earlier period have engaged to nip any such combination in the bud, or to prevent any such overwhelming predominance of one as should be dangerous to the other European states. It is scarcely, however, necessary to discuss a course which opens a wide field for argument, because it is certain not to be adopted. The Government has gone too far in the same track to make so decided a divergence, and Mr. Bright himself can scarcely expect to see the abolition of the Foreign Office and the suppression of the whole diplomatic body in his day. If, then, we are to indulge in this expensive piece of machinery, it is quite clear that the article which it manufactures, namely, our foreign policy, should be of the best possible description,—a fabric of a strong and substantial texture. But the policy of the Foreign Office is in fact governed by the will of the nation; and in the present condition of the Continent it becomes necessary for the nation to consider which side it will espouse,—that of the monarchs or of the people.

The first question which presents itself for consideration is one of principle, the second one of interest. There can be no doubt that any intervention of one Power in the internal affairs of another is morally wrong, but the country was not prepared to carry out the principle, when the only means of preventing such intervention in favour of an oppressed nationality was to go to war with the intervening Power. In the case of the late war in the north of Italy, we abstained from any interference on this ground, but matters have considerably changed since then: the whole of Europe is preparing for a general struggle, and monarchs and nationalities are ranging themselves side by side, without reference to any other standard than that of their own interest. Hence the most unnatural alliances are taking place. Russia, anxious to stride across the Danube, is calmly fostering revolution in Hungary, on her own frontier; Austria has put aside her determined antipathy to Prussia, and humbly sues for her protection. Louis Napoleon, who is the incarnation of despotism in his own country, is the representative of freedom elsewhere, and on him the oppressed nationalities fix their hopes. Right and wrong have become so confounded, there is so little of the first in the whole complication, so much of the latter, that a purely moral policy, which should still be active, would seem impossible. To maintain despotism by force of arms would be an outrage to the liberal sentiments of England; to engage in a war in favour of the people against their Sovereigns, who have in no way injured us, involves a principle which even the most ardent advocates of free institutions will hesitate to maintain; while, to remain neutral would be to allow the two Powers whose predominance we have most reason to dread, to divide between

them the absolute control of the affairs of Europe, and to partition for their own benefit the Ottoman Empire.

To retain our position, and come out of the struggle upon equal terms with France and Russia, we must either sacrifice our principle to our interest, as they have done, and put ourselves at the head of the European revolutionary movement, which would obtain for us the whole sympathies of the people of Europe, and fill most completely our antagonist; or we must sacrifice our interest for a principle, and make the intervention of any nation in the internal affairs of another a *casus belli*. The latter course would be extremely disagreeable, but morally right; and any government proposing it would be at once turned out of office. The other course would be the most profitable and advantageous to this country, and if dexterously carried through might lead to great results; but it would be morally wrong, and any government proposing to go to war, to free either Italy or Hungary, would also be turned out by a coalition of that party which is in favour of peace and economy with those who are advocates of justice. Hence the Government are forced into the course of vacillation which we have described; and the nation will continue to waver between right and wrong, because its sympathies and its moral sense, until the danger becomes so imminent that the Government and nation will unite in adopting that firm and decided attitude of resistance to individual or national aggression which, if it had been taken up at the outset, would have saved us from the catastrophe into which we are being inevitably drawn. It is a penalty we must pay for the luxury of free institutions, that we can never hope to have a foreign policy worthy of the name, and that we shall continue to blunder on in obedience to the will of the majority, who cannot possibly be properly informed upon the internal condition of foreign countries, or acquire that early appreciation of inevitable political necessities which is essential to an able diplomacy, until we are driven by our own mistakes into a position from which the only escape is by the strong arm of the nation, backed by its united will and immense resources.

REFORM IN RUSSIA.

THE real state of Russia is important to be known to the western nations of Europe, at the present perilous juncture of European politics. Whether that great empire be stagnant or progressive,—whether it be youthful in vigour, or old in decay—is a question that is of more or less importance to every citizen of every state in the civilized world. To the majority of Englishmen the word "Russia" conveys the idea of a gloomy despotism, where thought is stagnant, personal freedom non-existent, and the wishes of all controlled by the authority of one. If they think of it at all in connection with foreign countries, it is as an abominable power, desirous of extending its sway from the Baltic to Hindostan, and from the White Sea to the Hellespont. Though there be some truth in this picture, there is considerable error. It would be easy to show that great misconception prevails as to the domestic as well as to the foreign policy of Russia; but, leaving its foreign policy for another opportunity, we proceed to record some of the steps that have been taken since the death of the Emperor Nicholas in the path of domestic reform.

The removal of that remarkable sovereign from the scene of his uncontrollable ambition was a relief to Russia. Circumstances and his own indomitable character had given him a power far greater than any of his predecessors; and, alarmed by the progress of liberal ideas in the rest of Europe, he not only repressed with the utmost severity anything like Liberalism at home, but in order to counteract that longing for liberty which had sprung up in the breasts of his subjects, he kept their minds occupied as much as possible with foreign wars. Just before the Revolution of 1848 the sparks of Louis Philippe's resistance to reform, to a liberal-minded and free-spoken nobleman attached to the household of the present Emperor, then grand-duke, he said, "The king is quite right; their rulers are the best judges of what the people want. I would sooner lose my life than yield anything to a popular cry." Nicholas was a thorough despot—cruel, but not blood-thirsty. He allowed of no opposition, and his death was undoubtedly accelerated as much by vexation at the growth of liberal opinions among his people as at the adverse results of the Turkish war.

When Alexander II. ascended the throne, the people breathed more freely. The new czar was known to be opposed to the repressive policy of his father, and his first proclamation showed that the reign of darkness was at an end. Under Nicholas there was no religious freedom, no liberty of the press, the finances were utterly mismanaged, and the serfs saw no hope of emancipation. Freedom of conscience was recognised, indeed, in the fundamental laws of the empire; but the Greek religion being eminently illiberal, it was hardly to be expected that the czar, as head of the Church, would hold opinions much in advance of the Church itself. In Russia, orthodox exclusiveness assumed a variety of forms. Lutherans and Mohammedans enjoyed complete liberty. Romanists were subject to certain restrictions, being expressly forbidden all attempts at proselytism; Jews could worship as they pleased, but had no civic rights; while Dissenters from the orthodox Church were treated with as much

severity as the Covenanters in the reign of Charles II., or the Camisards under Louis XIV. Dragoonades were employed to enforce conformity; the knout and the stick were not spared; and the holy communion was often administered by force. By this Act the Disenter became an orthodox Christian, and relapse was punishable with death—though that penalty was rarely inflicted, the police preferring a heavy fine to the life of their victim. Successive relaxations have done much to alleviate this condition of things. Disenters are now so far recognised that they are not to be called in question for their creed, and heterodoxy is no longer a disqualification; but the propagation of "heretical opinions" is still forbidden. As regards certain sects, this is perhaps a wise regulation, for unless they are grossly belied, their practices are incompatible with morality. The Jews are no longer an excluded class in the army—they are permitted to rise to certain ranks; but here popular prejudice thwarts the benevolence of the sovereign, for the orthodox soldier refuses to obey his Jewishish officer. One of the most recent decrees (dated 12th April) concerning this persecuted class, extends their privilege of employing Christian servants, and so far the Greek Church has shown itself less fanatical than that of Rome. A new translation of the Gospel has been issued "by authority," and the whole of the Bible is to follow in due course.

One of Alexander's earliest measures was to remove some of the most oppressive restrictions imposed upon the press by Nicholas. The thirty years' war carried on by the late czar against the liberty of printing was terminated by a decree allowing new reviews and journals to be started; and the censorship, hitherto partitioned among a dozen different bureaux, was concentrated in one, under the immediate responsibility of the Minister of Public Instruction. The working of the system is more liberal than the programme; new foreign books and newspapers are still suspiciously watched, and political matters need very tender handling in the Russian language, though a greater licence is allowed if French or German be used. There is no more difficulty, however, in procuring prohibited books in St. Petersburg than in London. We have before us now some numbers of the *Kozakod*, a Radical Russian work, published in London, which was regularly sent through the post, and freely circulated from hand to hand in the capital. The real position of the press may be estimated from the fact that the Government has recently "invited" discussion on the questions of serf emancipation, the spirit licences, and popular education.

The progress of popular education is necessarily slow in a country situated like Russia; but, independent of its state and communal system, not unlike the Scotch, the Government has invited private aid, and the response has been most hearty. The latest symptom of vitality has been the springing up of Sunday-schools, not only in the two great capitals, but in remote towns on the borders of Asia, in lonely villages, and on private estates. At Tver, the professors of the college have volunteered to teach, and a rich merchant provides the necessary books, paper, &c. At the Kiev school, which is but a few months old, the scholars amount to 148; of those, 32 belong to the peasant class, 25 to the *bourgeoisie*, 25 are soldiers' children, (*kantonists*), 5 belong to the nobility, and 1 only to the class of traders. Ranked by occupation, there are 112 workmen, 22 servants, and 12 of "no profession." As regards age, there are 56 between eight and fifteen years, 63 between fifteen and twenty, and 29 above twenty. Nor has the education of girls been neglected. In one place the mayor endows a school for his town; in others, the landowners provide reading-rooms for the young peasant girls. At Kozlov (Tamboff) the priest's daughter looks after the little pupils; at Talyvong (Olonetz), the vergier's wife undertakes the training up of several young women. There, and a hundred similar instances, plead loudly in favour of the Russian people, so misapprehended, and so little appreciated at home by those who should know better. In the colleges and universities a similarly progressive spirit prevails. The philosophy classes, suppressed twelve years ago, have been revived; logic and psychology are no longer to be considered a part of Christian instruction.

The question of the Emancipation of the Serfs, a problem of more difficult solution than the abolition of negro slavery in the United States, we reserve for another article.

CAVENDISH TOBACCO.

EXCISE and customs duties, to which some writers are immoderately partial, are imposed completely in ignorance of all their other consequences than the expectation of revenue, which is not always realised. They are enacted in the dark, and may inflict on the community immeasurable evil. Generally, it is the opinion of the Commissioners of Inland Revenue that their regulations are so admirably framed that they do not interfere with the progress and improvement of manufactures subject to Excise duties. When the conclusion of the commercial treaty with France, however, carried with it the admission of foreign spirits into this country, and the distillers came to demand a proper adjustment of duties in their interest, the commissioners were obliged to admit that their regulations increased the cost of the manufacture of spirits by a sum not

less than 5s. 2d. per gallon. As there were nearly 25,000,000 gallons made last year, it is plain, on this admission, that their regulations for this one article cost the country £600,000 per annum. This is pure waste. It is the pecuniary representation of an evil inflicted on the people, in order to collect the spirit duty. The commissioners recommended some changes in their regulations, by which the loss is now reduced to 2s. per gallon. This, however, omits all consideration of the possible improvements in distillation, which might be made in this refined art did they not interfere at all. It is perfectly clear that neither the legislators nor the land revenue commissioners have any idea of the vast loss and mischief they cause to the country by Excise and Custom-house duties.

A novel example of the mischief they do was brought before the public last week, in a letter from Messrs. Cope, Brothers, & Co., of Liverpool. These gentlemen state that nine smokers out of ten prefer Cavendish tobacco to any other. This tobacco is manufactured in America, on which our Excise regulations confer a monopoly. It is liable to a duty of 9s. 6d. per lb., but is so largely smuggled, they say, that it is sold at the current price of 3s. to 4s. Every sailor arriving from America imports it; every man-of-war, they add, is a nest of smugglers, for the crews are never without Cavendish which pays no duty. To meet the demand for this preparation of tobacco, paying the duty on the raw material, the Messrs. Cope turned their attention to the mode of manufacturing it by the help of machinery, and succeeded in making it equal in appearance to the best brand of America. They could not make it equal in reality, because the excise regulations absolutely prohibit the use of mechanical matter in any form in the manufacture of tobacco; and without this addition the finest article "seems poor and tasteless." They gave employment to a number of deaf and dumb girls, to whom they taught the art of manufacturing Cavendish, and who were able to earn from 8s. to 12s. per week. It is Messrs. Cope's opinion, that if the Excise did not interfere with this manufacture, hundreds, and even thousands of females might find employment, at wages of 10s. to 14s. per week, and give a fortune to their employers. But the Excise regulations prohibit this profitable exercise of industry, and encourage prostitution in the industry of the Americans. They give a bounty on labour abroad, and discourage it at home. This is only one illustration of Excise and Custom-house duties. They collect, it must be admitted, a certain amount of money for the State, at an enormous cost to the industry, the progress, and the welfare of the nation. The latest report of the Inland Revenue Commissioners, including the account of the punishments inflicted, and the many experiments, chemical and others, made to detect violations of the law, is a history of labour mispent in restricting and torturing the community.

PETITIONS OF RIGHT.

THE country is indebted to Mr. Borell for the Act of Parliament which he succeeded in passing during the late Session for the improvement of the law relating to Petitions of Right. This is one of the very few acts which will rescue the House of Commons from the charge of being, during that carnival of talk, wholly regardless of useful legislation. It is impossible to conceive anything more unsatisfactory than the state of the law relating to the above important subject existing before the passing of Mr. Borell's measure. The method of procuring redress for the wrongful acts of the Crown, or to speak with deference to the maxim, "The king can do no wrong," to obtain restitution for acts done by inadvertence, or through misapprehension, by the Crown, injuriously affecting a subject, was most vexatious and expensive. The proceedings were circuitous in the extreme, and it is almost impossible to say with accuracy how many steps had to be taken by the petitioner. After he had presented his petition, and the consent of the Crown to the proceedings had been obtained, a commission was appointed, to enquire into the facts of the case. The lawyers' fun then began, and the legal pantomime was enlivened with as many scenic changes as its historic original. Even if the litigation resulted in the petitioner's favour, he was not allowed to recover his costs against the Crown, except in one or two particular cases. The consequence of this machinery of justice was, that but few persons were rich enough to assert their rights; and only when the interests involved were of sufficient magnitude did they ever feel disposed to risk so great an expenditure of money and trouble.

Mr. Borell's Act, however, has at length removed the difficulties which made the law a dead letter; and a short and simple mode of procedure, similar to that in the superior courts in cases between subject and subject, has been established. Costs will be payable by the Crown to successful petitioners. It is feared that in some cases the Act will not apply, and the old law will still prevail; but in the great majority of cases we believe the latter has been entirely superseded.

YICHTA.—The first time this name occurs in English history is in belonging to a "Master (Master) Victoria," who was one of the attendants, "Gentyl-women," upon Queen Katherine, when she accompanied her husband, Henry VIII., to the gorgeous meeting of the Field of the Cloth of Gold (June, 1520). Each gentyl-woman was allowed "a woman, ij men servants, and ijij horses." And the Queen had 265 of all ranks, and they, in turn, had 999, making the total number 1260 persons. The King's retinue amounted to 4,644; Wolsey had above 400.

THEATRE ROYAL, HAYMARKET.—On MONDAY, September 24th, and during the week, will be performed (for the third time) Mr. Falconer's new and successful comedy, entitled *THE LEAVE MEY* in which Miss Anne Sedgwick will appear. Mr. Buckstone, Mr. Chappeland, Mr. Howe, Miss Florence Haydon, and Mrs. Wilkin will also appear in this comedy. **THEATRE OF THE PATENT, HAYMARKET.**—On MONDAY, September 24th, will be performed the new and successful comedy, entitled *THE LEAVE MEY*. Box office opens daily from 10 till 2.

NEW THEATRE ROYAL, ADELPHI.—Sole Proprietor and Manager, Mr. R. WEBSTER.—Great Success of the New Drama by Don Boucicault, Esq., *THE COLLEGE BAWN*.—Miss AGNES ROBERTSON and Mr. JOHN BOUTCHARD, every evening—On Monday and during the week, *THE RIFLE CORPS*. Messrs W. Smith, D. Fisher, Jolly, Miss Wm. Billington, *THE COLLEGE BAWN*. Messrs D. Boucicault, D. Fisher, Billington, C. J. Smith, Robert, Ward, Miss Agnes Robertson, Miss Wm. Billington, and Mrs. Chatterley. After which, *THE WOULD BE AN ACTRESS*. Miss Agnes Robertson, Miss Louisa, Mrs. Chatterley, Mr. D. Smith, P. Bedford, Mr. Rogers. To conclude with *MUSIC HATH CHARMS*. Mr. D. Fisher, Robert, Ward, Miss K. Jolly, Comedian at Seven.

CORREGGIO'S EVE HOMO, the long-sought Replica of the National Gallery Picture, which the most eminent judges pronounce the finest painting in this country, is ON VIEW at No. 11, New Bond-street, at GARDNER'S GALLERY, 118, Old-street.

RELIEF OF LUCKNOW.—Barker's Picture.—This Grand Historical PICTURE is NOW ON VIEW at 279, Cornhill.—S.B. The Portraits of Lord Clyde, Sir J. Outram, Sir John Inglis, the late Sir H. Havelock, Col. Alcock, &c., will also be exhibited. Admission free by private address card.—RAYWARD and LINDSAY, 279, Cornhill.

M. HOLMAN HUNTS PICTURE OF THE FINDING OF THE SAVIOUR IN THE TEMPLE.—This Picture is now on view at 279, Cornhill, at GARDNER'S GALLERY, 118, New Bond-street, from Nine till Six. Admission, 1s.

MADLE ROSA BONHEUR'S PICTURES OF "SCENES IN SCOTLAND" AND "SPAIN AND FRANCE" ARE NOW ON VIEW at GARDNER'S GALLERY, 118, New Bond-street, from Nine till Six. Admission, 1s.

SUBSCRIPTIONS FOR "THE LONDON REVIEW" received by Messrs. W. H. SMITH & SONS, at 106, Strand, and at all their Railway Book-stalls.

PISSEZ & LUBIN'S SWEET SCENTS.—Frangipani, Kias-mo-quick, White Rose, and others from every flower that breathes a fragrance, in bottles, 2s. 6d. each, or three in a case, 7s. 6d. Sold by every fashionable druggist and perfumer in all parts of the world.—Laboratory of Flowers, 1, NEW BATA STREET, London.

SCALE OF CHARGES FOR ADVERTISEMENTS.

FOUR LINES 2s. 6d.

Every additional line, after Four Lines, Sixpence.

Advertisements exceeding One Column in Width are charged in proportion.

THE LONDON REVIEW

AND
WEEKLY JOURNAL.

SATURDAY, SEPTEMBER 22, 1860.

The States of the Pope are divided by the Apennines into two regions; one sloping to the shores of the Adriatic, and the other to the seaboard of the Mediterranean, into both of which separate armies have entered from Northern Italy. The western army, proceeding from the highlands of Tuscany, has descended into the basin of the Tiber, towards Rome, by Castello, Perugia, Todi, and Orvieto. It has stopped in its progress at the place last named, where it is in immediate proximity to French troops, who have marched northwards from Civita Vecchia, to check an insurrection at Viterbo. While this is the position of the Piedmontese forces to the west of the Apennines, the great body of the army has descended southward along the seaboard of the Adriatic, taking in succession the towns of Urbino, Fano, and Sinigaglia.

Under the walls of Ancona, a short but desperate battle took place on Tuesday, the 18th. The Papal troops, headed by Lamoriceio, to the number of 10,000, attacked the position of General Cialdini, but were totally defeated, the wounded, among whom was General Pisanini, with 600 prisoners, falling into the hands of the Piedmontese. After the battle, the greater portion of the Pontifical army capitulated, although General Lamoriceio, with a few horsemen, succeeded in reaching Ancona by passing through the defiles of Monte Casaro. Beyond the walls of Ancona there is not now one Pontifical battalion. The Royal troops occupy a strong position in the neighbourhood, while the Neapolitan naval squadron, under the command of Vice-Admiral Persano, having doubled Cape Spartivento, have attacked the city from the sea.

For some time back Garibaldi had been fully employed at Naples, where he has found it necessary to introduce legislative changes, which, however excellent in themselves, will provoke a formidable opposition to his power. He has liberated all political offenders from the prisons of Naples, abolished the custom-house barriers between Sicily and the mainland, introduced trial by jury in penal causes, and suppressed the order of the Jesuits in all parts of the kingdom. To carry out such measures a strong government is clearly requisite, and it is unfortunate that Garibaldi is obliged to quit Naples when his presence there is so necessary. He is determined, for some time at least, to retain the dictatorship. In a recent proclamation to the people of Palermo he reminds them that if he had listened to the miserable men who spoke of immediate annexation, he would not now have addressed them from the beautiful capital of Southern Italy. To this announcement he unfortunately adds, that he will proclaim the kingdom of Italy, not at

Palermo or Naples, but from the summit of the Quirinal, which has been interpreted into a threat that he will, should he find it necessary, attack the French troops at Rome.

The advance of the Sardinian army into the Papal territory was followed, on the 14th, by a short note in the *Monitor*, which announced the withdrawal of the French minister from the Court of Turin, and the dissatisfaction of the Emperor with the course adopted by the Government of Sardinia. This note has been followed by elaborate articles in the *Pays* and *Constitutionnel*, which endeavour to justify this step, and to show the consistency of the policy pursued by France. A more intelligible memorandum or circular has, in anticipation of these documents, been addressed by the Sardinian Government to their representatives at foreign courts, accompanied, it is said, by a confidential despatch, stating that Garibaldi had given the Sardinian Government to understand, that if the Sardinian army did not enter the Roman territory, the Neapolitan army of invasion would do so.

At Toulon, it was reported in the beginning of the week, that another attempt had been made to assassinate the Emperor of the French,—this time not by a political fanatic, but by an ordinary maniac. The statement has been since contradicted in the Paris evening journals of Wednesday, which are instructed to say that it is altogether false. Whatever may have happened, certain it is that no incident has occurred to interfere with the imperial tour. In the end of last week the Emperor left France for Africa. On Saturday he disembarked at Port Mahon, where he had arranged to meet the Queen of Spain; and at noon, on Monday, he arrived at Algiers, where he was received by the Bey of Tunis.

From Austria the news is of the deepest interest. The Government are making every exertion to increase the army, but they find that so many Austrian subjects have been allowed to enter the service of the Pope and the King of Naples, that men are not to be obtained to fill the gaps existing in the service. A large bounty is in vain offered to volunteers, and lads of fifteen are readily accepted as recruits. The utmost dread is felt that Garibaldi, instead of attacking Venice, will proceed from the western to the eastern coasts of the Adriatic, and, disembarking there, will enter Hungary, and, at the head of the Magyar population, descend upon Vienna. At Fiume, accordingly, the Austrians are concentrating troops and constructing earthworks. The Hungarians are, it is believed, ready to rise at a moment's notice, while correspondence, published in the newspapers of Milan, shows that the inhabitants of Istria and the districts round Fiume are enthusiastically devoted to the cause of Italian liberty.

If a Hungarian revolution should burst forth, it is to Russia alone that Austria must look for assistance; and that assistance may be obtained in this quarter is not improbable. Count de Toli, aide-de-camp general of the Emperor of Russia, in fact, arrived at Vienna on Monday last, with an autograph letter of the Czar, inviting the Emperor of Austria to an interview at Warsaw, which has been accepted. The Prince Regent of Prussia agreed to be present at the interview, which will take place on the 14th of next month. The *Tribune* doubts the possibility of any reconciliation between the two emperors; and, in a series of articles on Pan-Slavism, virtually incites the Slavonic population of Austria to seek for a union with Russia. That Russia anticipates a struggle, in which she may be involved, is apparent. In the camp near Warsaw, 50,000 men will soon be concentrated. More than an equal number of troops, originally intended for the same destination, have been ordered to proceed to the south, where they are to form a second line of attack against Turkey.

While the Czar is concentrating his forces in Bessarabia, while discontent is manifested openly with the Turkish Government in every part of the empire, and while the disasters in Syria are not yet remedied, a much more serious evil has come prominently into view, which threatens, in a few months, to bring the present system of government to an abrupt termination. The finances are in a hopeless state of embarrassment, the Government having it no longer in its power to borrow on the security either of taxes or customs. More than half of the revenues of the State have been already absorbed in payment of loans made to the State during the previous seasons, and the balance does not suffice to pay the current expenses of the executors. The salaries of the civil servants of the Government have not been paid for six months, while the pay due to the army is eighteen months in arrear. The last sum obtained by the Sultan amounted to 75,000 Turkish pounds, for which 60 per cent. is to be paid, on the security of a residue of the unpledged dues of the Constantinople Custom House. There is not a copper left in the treasury. A foreign loan alone can avert revolution. Under these circumstances, the Grand Vizier is on his way to the Courts of Paris and London.

What may be described as a fourth great Volunteer review took place on Tuesday last at Gloucester, a city chosen with great propriety as a rendezvous for the riflemen of the English south-western and Welsh counties, not only as a centre to which the railways from all quarters converge, but as the place which set the example to this part of the island in the formation of rifle corps, when the movement was first thought of. The total number of troops on the ground was 6,003, five thousand spectators being accommodated with stands, while ten thousand were scattered over the muster-ground—a huge flat common, almost inclosed in a bend of the Severn, and situated in that picturesque part of the great vale of England which lies between the

Cotswold and the Malvern Hills. The day was fine, and the spectacle was in every way one of which Englishmen might be proud.

The next great gathering takes place on the 25th current, at York, where the Volunteers from all the three Ridings will assemble; so that a demonstration on an extensive scale may be anticipated.

There can be little doubt that the Volunteer movement begins to develop the military instincts in the English population. But for it would Captain Styles have met with so much success in London, Manchester, Liverpool, Glasgow, and Edinburgh? The first regular body of the "Excursionists," two hundred and fifty strong, left the Fenchurch-street Station, between five and six on Sunday morning, en route for Naples. They embarked on board the *Melrose* steamer at Tilbury. They will be followed by another detachment, nearly one thousand strong.

Notwithstanding the general enthusiasm for the Italian cause, the Garibaldi Fund has not, in all parts of the empire, been contributed to with the liberality which might have been anticipated. To make a collection in aid of this fund and to express sympathy with Garibaldi, a meeting was held on Tuesday night at Deyfords, Mr. Angerstein, the member for Greenwich, taking the chair. In an effective speech the Reverend Mr. H. N. Barnett, of South-street chapel, stated that he had seen the two hundred and fifty excursionists before they embarked at Tilbury. He was proud to say that they were not the rag-tag and bob-tail of the country, but fine tall fellows, young gentlemen, for the most part conversant with the outrages which have been perpetrated upon the suffering populations of Italy, and actuated by pure and patriotic motives.

The meeting of persons interested in the growth of cotton in the tropical possessions of England, referred to in our last number, took place on the 14th current, in the Town Hall at Manchester. Mr. Bazley, who took the chair, dwelt at some length upon the spininess exhibited, more especially in the Manchester district, on this question, which was one of interest, and not, as some persons seem to have imagined, of pure philanthropy. The promoters of the undertaking, however, do not seem in any way daunted by the lack of enthusiasm hitherto manifested for their scheme. They confidently anticipate a return of 25 per cent., and one of their number was sanguine enough to assert, that it will be the fault of the directors if the proposed association do not become a second East-India Company, entering upon its career under better and more favourable auspices than its great predecessor.

The missionary movement in the English universities, which Dr. Livingston has striven so anxiously to combine with colonial enterprise and cotton cultivation in Central Africa, but which contemplates as well direct intercourse with the Christian sects of the East, has recently shown symptoms of undiminished vitality. The Patriarch of the Armenian Church has met the advances of the great theological seminaries of England. He has expressed a strong desire for a closer communion with the Anglican Church, and to effect this object the Reverend George Williams, B.D., a Senior Fellow of King's College, Cambridge, has set out for Armenia, with the view of assisting the Eastern Churches in establishing hotels at Cambridge for the education of young men from Armenia and Georgia, and the neighbouring provinces of Russia, Turkey, and Persia. The government of St. Petersburg have already resolved to found one seminary at Cambridge for the education of their Armenian subjects, and it is understood that their example will be followed by the native Christians south of the Russian frontier, who are expected to send a number of young men to Cambridge, headed by an Armenian bishop, who will watch over them while they remain at the University.

The coroner's jury, in the case of the Helmsford accident, have now completed their inquiry, returning, in conformity with the evidence, a verdict of accidental death, but finding at the same time that the amount of break-power was insufficient, the number of guards too small for so large a train, and recommending the attention of the directors to the evidence of Colonel Yolland, who gives his opinion that a station should never exist at a point where the descent is so rapid as to admit of the carriages running away. The couplings were, it appears, as strong as they should have been, too great strength in these articles being undesirable, as they should be made so that they may snap if dragged off the line by any accident to the locomotive.

The Queen arrived at Osborne on Tuesday morning. This day she will embark at Gravesend for the continent. Her Majesty will be met, on landing, by the King of the Belgians, at Coblenz by our ambassador at Frankfurt, and at Aachenburg by the English ambassador at the court of Bavaria, who will accompany the royal party to Coburg Gotha.

On the 1st of September, the Prince of Wales laid the foundation stone of the new Houses of Parliament at Ottawa, which has been fixed upon by the Queen, at the request of the Canadians themselves, as the site of the future capital of Canada. At his entrance into the Great Lakes a rather unpleasant incident occurred. The Orangemen of Kingston resolved to erect an arch, and to march in procession. Knowing the state of feeling between Protestants and Catholics in this part of Canada, the Duke of Newcastle intimated that the Prince would not lead unless the Orangemen agreed to suppress all party demonstration. This they declined to do, so the Prince proceeded to Toronto at the other extremity of Lake Ontario, where preparations for his reception had been made on a scale which even exceeded in splendour those accorded him at other Canadian cities.

MONEY AND COMMERCE.

THE rainy weather, which returned at the close of last week, and continued through the early part of this, has again increased the upward tendency of the price of wheat; at least, in the language of the Corn Market, it has become firmer. A check has, in consequence, been given to business in other markets, and in these slackness has been the rule. Of course, the great daily buying and selling in all markets goes on incessantly, but has gone so regularly this week that there is no change of importance to notice. Prices, even on the Stock Exchange, were almost unaltered till Wednesday, when the influx of the precious metals, and the comparative dullness of enterprise, making money rather more plentiful, and there being no political cause for increased distrust, they improved somewhat. Railway shares, too, have continued to increase in value, though much business has not been done in them. Traffic, it is noticed, is rather declining on the western lines, while it is increasing on the others. The rate of discount, generally, remains unaltered; but money is more easy, and first-rate bills can be discounted at 91 per cent.

The appearance in the Bankruptcy Court of Messrs. Streetfield, Laurence, and Mortimore, the great leather-dealers, who failed on July 2, is the chief commercial event of interest. No partner of the name of Streetfield is now in existence, the name having been kept before the public after its owner had disappeared from the scene. Instead of Streetfield, however, a Mr. Schrader appears as a partner, carrying on business, in conjunction with Laurence and Mortimore, at Liverpool. The house in St. Mary Axe has been established, it appears, fifty-four years, and seems to have been, in common with many other houses, in difficulties in 1857. At that period it had discounted with the Bank of England to the extent of £120,000, and the Bank would discount no more without collateral securities. Title deeds were deposited in 1859, which never afterwards were redeemed. The difficulties of the house must have been long apparent to the managers, and so others dealing with them; yet, in 1859, it is found under solvent to Overend, Gurney, & Co. to the extent of £160,000 to £180,000, and will sought more advances, and more were made to it—it was propped up. Mr. Chapman, according to the evidence of Mr. Laurence, said, "You must not stop;" and the result was that the house which was "propped up" which had propped up others in believing them all to be equally sound, at length failed for £295,395, of which £271,375 was lost by "propping up" smaller houses. The total assets were £195,245. But while these immense losses are incurred by the house, the partners' separate estates are said to show a surplus.—Laurence's of £30,387, Mortimore's of £28,303, and Schrader's of £1,818. They took, however, from the concerns which were making, not profits, but losses. Mr. Laurence, in 1857, the sum of £51,966 for their private pocket, or about £5,000 a year; and their separate estates might well be large as they thus lived on their credit. All the books were so well kept as to merit much praise, and all parties to their transactions seem to have been satisfied with the careful entries of all the multiplied transactions. The bankrupts were consequently allowed to pass. There is for us something very curious in these "satisfactory accounts;" for, notwithstanding their great accuracy and their great minuteness, they did not make Mr. Laurence acquainted with his own position. He believed, according to his own deposition, that just before the failure, the house had a surplus of £228,000, including a reserve fund of £45,000. What an enormous delusion did those very accurate and minute accounts encourage in this eminently great business man, who kept up many small houses, and who at the time of his failure was under discount to the extent of £117,237. Looking at the balance-sheets presented to the public, and the manner in which this gentleman was deluded, and deluded others by his books, we cannot help concluding that the very minute and accurate way of framing "balance-sheets" now common, rather than keeping a register of loss and gain, is calculated to mystify both the dealer and the public. Since the business of an accountant has become so extremely lucrative, it may be supposed that the experts, like experts in other professions, like to hallow their own business in mystery, and hamper themselves. We cannot join others in railing at facility of discounts and extent of credit, because those are now essential to society. Credit is only another name for confidence, and a merchant or money-dealer is no more justified in entering into large transactions with another without some satisfactory assurance besides a mere show of wealth and respectability, than he has to take a man into partnership because he is well dressed. As the rule, owners of money-capital are not employers of capital. Those are to be found in the active, enterprising, skillful, younger portion of society, and only in their hands and by their skill and habits can the realized property of others be put to a profitable use for the good and the whole of society. The enterprising man must therefore be trusted, and when great failures occur, we may be sure that, as in this case, the lenders have not used due caution in carrying on their business.

Next to the faulty mode of keeping accounts, which deluded the unfortunate Mr. Laurence, we must attribute the failure to the rashness of the concern. In modern times some undertakings and speculations ramify into so many branches that, so far as magnitude is concerned, they resemble matters of state,—the very gigantic nature of which causes them to be improperly comprehended and imperfectly dealt with. As Mr. Laurence knew nothing certain about his own concerns, it is not at all surprising that he was ignorant of the condition of all the minor concerns he propped up, nor that all were rotten together. Ignorance, either real or assumed, combined with a desire to get wealth—the ruling passion—for all men, from the first minister of state downwards, may "they must have money!"—like at the bottom of these lamentable disasters. We cannot join others in railing at facility of discounts and extent of credit, because those are now essential to society. Credit is only another name for confidence, and a merchant or money-dealer is no more justified in entering into large transactions with another without some satisfactory assurance besides a mere show of wealth and respectability, than he has to take a man into partnership because he is well dressed. As the rule, owners of money-capital are not employers of capital. Those are to be found in the active, enterprising, skillful, younger portion of society, and only in their hands and by their skill and habits can the realized property of others be put to a profitable use for the good and the whole of society. The enterprising man must therefore be trusted, and when great failures occur, we may be sure that, as in this case, the lenders have not used due caution in carrying on their business.

The price of rice has risen in the week; and the price of cattle and sheep has further declined, so has the price of tea.

THE GOITY PHILOSOPHER.—No. XI.

MR. WAGSTAFF DISCOURSETH UPON "SLANG."

I AM not satisfied with the manner in which Slang has been treated by "THE LONDON REVIEW," or by its correspondent, Mr. Slanham. I have perhaps said enough about Slop, and the Slop system, as proof of the insidious as well as the immorality of the age. But Slop and its ramifications by no means exhaust the question. To the instances of deterioration—material and moral—which I have cited as characteristics of our time, a few words may be added on the deterioration of our noble English language—[the richest, most pliable, most useful, and most expansive language in the world]—by the constant introduction of slang words and phrases, and the daily use made of them, by persons of education and supposed refinement. It is especially among the young men of our day that the vice has taken root; and from the young men it has extended to the young women—too many of whom take as naturally to a course of weak and attenuated slang as to hoops and red stockings.

Perhaps the prevalence of slang words, and slang ideas, in this age may be caused by excessive mocking and its ignoble concomitants, or by the depraved taste for comic literature, falsely so called [there is little comedy and no wit in it], or by that general lowering of the tone of public sentiment, of which "Slop," moral as well as material, is one of the most unwholesome symptoms. Our forefathers had a very odious vice—that of profane swearing; but I am not sure if the vice of their more effeminate sons—that of vulgar-speaking—is not more detestable, and that it does not show a greater depravity of moral feeling. If a round hearty shout implied anything, it was either honest indignation, hearty derision, silly impetuosity, or more parrot-like imitation; but the habitual employment of slang words and phrases implies something worse, and meaner than any of these. Slang words imply, in him who uses them, a want of reverence for things that are worthy of it. If a son constantly speaks of his father as the "Governor," or the "Believing-officer,"—he may be a good son, but he has not that respect for the sacred name of "father" which every true son ought to express as well as feel. If a man cannot use the simple word, "the sea," or "the ocean," but must say that he has been walking by or bathing in "the briny," we may be quite certain that he has fallen into the evil habit of irreverence, and that the contemplation of the sea yields no such emotions of joy or beauty to his mind as it yields to others of finer sensibilities and taste less corrupted. When another speaks of his "old woman" and his "kids," he may love his wife and children as much as he ought; but he betrays by his language that he has associated with low-minded companions—been contaminated by evil communications—lost his good manners, if he ever had any, and failed to reach that high mental and moral plane where stands the true gentleman.

When a man, young or old—worse by far if he be old,—speaks of his clothes as his "togs," of his hat as his "till," of his pocket-handkerchief as his "wipe," of his cravat as his "choker," of his watch as his "ticker," of his food as his "grub," of his money as his "tin," of a shilling as a "bob," of pence as "brads" or "browns," and offers to pay his reckoning by stating that he will "fork out," or "shell out," or "come down with the dust," he is not a gentleman. He may be a lord, or a baronet, or an honest poor fellow; but he who speaks a language not fit for costermongers—and a jargon that ought to be left to the low betting-man, the burglar, and the pickpocket.

When you hear a man or a woman use the word "jolly" on all, or most occasions, instead of very,—saying that A is "jolly green," or B "jolly stupid," or C "jolly slow," or that the weather is "jolly hot" or "jolly cold,"—or when you hear another use the epithet "awful" in a similar sense, saying of such one that he is an "awful swell," or an "awful ass," or an "awful kumbag," or that so-and-so ran or walked, or ate or drank, or roared or laughed "like one o'clock," erase their names from your visiting-book, and cease companionship or acquaintanceship with them as quickly as you can. They are not of the right colour of mind. The true image and superintention are not upon their faces. They are of base metal, and should not pass into, but out of, the society of gentlemen and ladies.

If a person newly introduced to you says he will "do the handsome," or "the needful," and characterizes anything that astounds him as a "stunner," or a "screamer," anything that pleases him as "plummy," "spicy," "cheesy," or "the cheese;" talks of his friend as a "brick," or of his rival as a "weed," you may do business with him, if you have a business, but you will be ill-advised if you invite him to dinner.

As for women (I cannot call them ladies) who use such words;—however fair and chaste they may be;—if they are lovely as Venus and immaculate as Diana,—they injure their chances of matrimony if they be single, and injure matrimony itself if they be married. Men are indulgent to their own vices, but they detect and abhor to see the same vices in a woman. A man may smoke and talk slang without loss of character; but let a woman do either, and the man who is most guilty of either practice will be disgusted. The ladies, God bless them! do not smoke; every true lady detests tobacco smoke as an outrage to the purity of her presence, as well as to that of her dress, and the furniture of her room; but there are women in our day who have caught from the lower classes the contagion of male—it cannot be called manly—Slang, and who talk of giving a servant "the sack," of their husbands having "kicked up a shindy," of their having had "their dauder up," or of their having "been choused" out of a

new shawl or bonnet. Let such fair inconsiderates, whether they be wives of grocers or of peers, reflect a little on the offence of which they are guilty. A solecism in language is as painful as a false note in music. It grates harsh discord upon the ear, and creates pain as well as displeasure. It is not given to every one to be refined; but it is given to every one to be natural. The plain, rude dialect of an uneducated boor may be agreeable to the man of taste and learning; but the slang of the educated and the half-educated is simply vulgar and detestable. Better and far nobler the broad, honest speech of the peasant and artisan, with all its peculiarities of accent and grammar, than the heartless, brainless jargon born of the streets, the stables, and the tap-rooms of great cities, and which thrusts itself upward to infect the minds of the young at the imitative period of life, when anything and everything evil may be learned. The youth of fourteen thinks it manly to walk up and down Regent-street with a cigar in his mouth; so, for the same reason, he thinks it gentlemanly to ape the language of his elders. The evil is no slight one, and is not simply a question of taste, but of morals and religion and of national character. It may be a proof of advanced civilization; but the advance borders upon rotteness, and prefigures dissolution. Chaucer, in a noble line of his almost forgotten poems, says that

"Men shall not weave everything a lie."

but those who speak slang, do woe everything a lie. They are men without reverence, who, worse than the diplomatist who said that speech was given to us to conceal our thoughts, use it as if it were only given to us to delude and defile them. They are jesters without wit, buffoons without drollery, scoffers without an object, scorners without a conscience,—fellows who laugh without mirth, speak without sense, and parody without intellect. It may be said that the Slang to which I take such objections, and to which I attribute so many evil qualities, direct and indirect, is so gross and palpable as to be of necessity left to the conversation of the great and the little vulgar, and to be entirely excluded from literature—but it is not so. We not only find Slang on the stage, and in what are called the comic publications of the day,—in the books of the "fanny" men who write Comic Histories of England, and Comic English Grammars, and who would write a Comic Bible if they could clear a few pounds by the performance,—but in that higher class of literature which takes the shape of leading articles in the daily newspapers. There is a kind of literary and professional Slang, which though of a less vulgar character than the Slang of the streets, nevertheless tends, in no inconsiderable degree, to sully the purity and impair the strength of our language.

Take the word "ventilate," for instance, which is now so constantly used in newspapers, in Parliament, and in good society, as an equivalent for "discuss." There is neither necessity for, nor force in the expression. To ventilate is to let in air or wind; and if to ventilate a question, mean to let in wind upon it, in the form of mere talk and windy words, there may be some appropriateness in it, in a metaphorical sense; but when the Marquis de Malaprop declares in the House of Lords that he is anxious to "ventilate" the affairs of Italy, and Mr. Pogram asserts in the House of Commons that the administration of the navy, and the jobbery of the dock-yards cannot be too often or too much "ventilated," they cease to be metaphorical, and speak a parliamentary or professional Slang. Newspaper editors, critics and reporters, as well as novelists and essayists, also make use of certain favourite phrases, which by their daily iteration become Slang. When a journalist cannot say that he "suspects" anything, without informing the world that he "shrewdly" suspects it,—or when a novelist cannot describe the handsome face of a man, or the lovely face of a woman, without stating that the features are finely "chiselled," or the eyebrows finely "cut,"—they are severely guilty of the use of literary Slang. The particular suspicion may be very "foolish," and not at all "shrewd"; and how can a living face be "chiselled," or an eyebrow be "cut," unless by a sharp instrument!

Among the most common Slang phrases of this description which are continually thrust before the eyes of readers, are that such a scene "beggars description," or may be "more easily imagined than described,"—that fire is "devouring elements," that the writer "can safely say" so and so; that such a man's writings are "household words;" that such and such a fact "speaks volumes;" that such an event happened "not a hundred miles from" Little Peddington; or that such and such an article or poem in a magazine or book "is well worth the whole price of the volume." Now the price of the volume may perhaps be a shilling, or half-a-crown;—this, the article or poem in question is worth a shilling or half-a-crown. This is but poor praise at the best, and very loosely worded.

But these offences are comparatively venial. If they are silly they are not immoral. Not so the Slang or Argot spoken by gipsies and thieves. Even that, if it be confined to thieves, may be admitted to be a very interesting subject for philological study. Thieves' language, as such, and when it is spoken by people who know no other, merits the respect which every real thing commands, on account of its reality, if for nothing else; but when it gets into the mouths of honest men, and of those who would knock you down if you dared to say they were blackguards, it becomes not alone disgusting, but pernicious. I may be called by such people, in their own slang, an "old fogie" for saying so, but its common prevalence shows, I think, a deterioration of the moral character of the age, and may have a greater effect in producing swindlers, forgers, and fraudulent bankers than is commonly imagined.

MEN OF MARK.—No. II.

LORD LYNDHURST.

It may be doubted whether any country in the world can boast three such men as Lord Lyndhurst, Brougham, and Campbell. A neighbouring state may produce one or two great lawyers and judges who have also distinguished themselves in her legislative assemblies; but revolutions and changes of dynasty have at one time condemned them to silence, and at another have exposed them to charges of political apostasy. It has been the happier destiny of the great men we have selected as the subject of this and a following article, to preserve a golden continuity in their public aims, and as much consistency in their political career as can be expected from fallible mortals. Three judges equally venerable, equally distinguished for learning, integrity, and impartiality, could scarcely be found, either on the European or American continents. But, when we remember that they are not less celebrated for their knowledge of the law than for the success with which they have laboured for its reform and improvement—when we spread to their claims as law reformers their world-wide fame as orators and politicians—when we recollect that they have not only taken a large and active share in home politics, but have done much to uphold the reputation of the British Senate as the great platform of freedom, and the last and sure refuge of the oppressed of all races and all climes,—we may congratulate the England of Bacon, Somers, and Mansfield that her great men have not all died out, or left themselves without witnesses in those later days.

And first of all Lord Lyndhurst. We shall suppose it to be some five-and-twenty years ago. We are in the House of Lords. The month is July. Some great event is surely expected, for the House is unusually crowded. Melbourne, gay, easy, smiling, *insouciant*, is Prime Minister. He looks, perhaps, more indifferent than he is; his colleagues undoubtedly appear glib and ill at ease. The "Great Duke" is the central figure on the front Opposition bench. On his right is a tall handsome man, who looks about fifty, but may be older, who divides with Wellington the gaze of "neighbouring eyes." Monkeys come in from the Commons, and fill the space below the bar. Peel, Stanley, Graham, and Goulburn, occupy the arms in front of the Throne, which is reserved for eldest sons of peers, ministers, and ex-ministers from the Lower House. When the auditory have composed themselves in their places, the handsome-looking man advances to the table. His well-proportioned figure is set off by a surcoat of faultless elegance, and he looks a gentleman, every inch of him. His features are regular, and indicate to the most careless observer great intellectual power. The mouth is compressed, but has a "knowing," and, as the Scotch would say, an "assuring" look about it. It is clear that he is a man of his word, and that the figure called irony is not unknown to him. With a glance round every part of the House, which denotes perfect self-possession, and elicits encouraging cries of "Hear" from the peers behind him, the orator may be supposed, under their Lordships' permission, to enter upon a brief REVIEW OF THE SESSION.

It would first be necessary to carry their Lordships back to the speech from the Throne, and the ministerial announcements in the other House of the measures to be proposed to Parliament. It would then be necessary to trace those measures separately, and to see how much had been left undone, and how much had been accomplished. By this time the stranger in the gallery has remarked a singular elocution, terseness, and simplicity in the speaker. There seems to be no straining after effect—nothing artificial in the structure of the sentences. Just so many words, and no more, are used as are necessary to put you in complete possession of his meaning. The elocution is perfect, the voice clear, the intonation musical. A graceful gesture with the right arm is at first sparingly introduced, to infuse attention and impart dignity to the exordium. By and by, as the proofs of the demonstration crowd upon the orator, and become more momentous, his gestures become more impetuous, as of one who strives to subdue and overbearn. That is a terrible catalogue of five-and-twenty years ago! Two or three of the great measures of the Session have been totally wrecked. One or two considerable measures have received the Royal Assent; but they have been either grievously mangled by legislative misadventure, or have been miserably improved by the orator's friends. The Budget has been a ridiculous failure; and their Lordships laugh long and merrily (as they have done since) at the pitiless history of the financial proposals of the Whigs. The law reforms of the Session are next directed by the same merciless and unsparring hand. Perhaps the orator is too much of a partisan to be impartial in his criticisms. Perhaps he does not make sufficient allowance for the growth of "talk" in the Lower House, which was beginning to strangle legislation, although it had not then attained to its present foul and rank luxuriance. The orator is just and impartial enough for the better half of his audience. The Great Duke cries "Hear, hear," and says to his neighbour, "That is the English I tried to write." Peel would have envied the orator his transparent clearness, if he could have envied anybody anything. The occupants of the Treasury benches are uneasy at being held up to the country as noodles, as having made prodigious promises and small performances. The stranger in the gallery thinks there must be some flaw in the logic, yet the ratiocination seems perfect, and the great fact remains that the end of the Session has approached and very little has been done. As for the Opposition Peers, their delight knows no bounds. Next to the delight of being in Downing-street, is the satisfaction of proving that you ought to be there, and that the nation is going to rain in your absence. Uselessly men, little "patterers" and decrepit dunces Lord Melbourne's Ministry appear, as portrayed by that vigorous and unflattering pencil. Some kind of answer is no doubt attempted. Various excuses, more or less reasonable, are certainly set up. Some hints, not very obscurely expressed, are thrown out, of factions opposition to Government measures by the orator's friends "in another place." But Opposition Peers go home arm-in-arm in high feather, and next day old Alderman prophesy that the country has had enough of the Whigs, and that a reaction in favour of Toryism is certainly approaching.

* The scene changes. We are in a magnificent mansion, furnished with gold and resplendent with colour. A queenly throne, with its ornate gold canopy, occupies one end of this lofty and well-proportioned chamber. The Peers are assembled. The Lord Chancellor, with the mane behind him, occupies the woad-sack. They wait some time. An old man, looking heavily, with the air of one friendly Peer, enters the House from the Council Chamber. His legs refuse their office, and hardly can he set one foot before the other. Slowly he moves down the House. If this be indeed the orator of a quarter of a century ago, how is it that he does not take his seat, as of yore, on the front Opposition bench? Has he outgrown Party? Has he become more candid—more liberal? When the aged Peer has nearly reached the gangway, he ascends to the second bench, and drops heavily into his seat, as if his legs were wood and his muscles had lost all their elasticity. See! they have made a hand-rail for him to grasp. It is attached to the bench below him; and he will with rise and address their Lordships, he might, perhaps, with some difficulty, get up with his legs, by this friendly aid. But can these dry bones speak? Is this venerable stony, whose tottering gait and shrunken limbs are suggestive of the cerecloth and the wind-impelled likely to utter anything but a tremulous and faltering voice from the grave? Let us look at him more narrowly. He is an old man, but not so old as you had thought him, or as you will know him to be to-morrow, when you turn to "Dod's Digest." He has a clear and undimmed eye, now shaded by coloured pantoscopic spectacles. There is a hectic colour on his cheeks, which are somewhat shrunk. His nose is small and regular; his mouth set compressed and expressive. You may involuntarily, when you look at his face, "That is the wreck of a handsome man;" and when you look at a certain pained expression in his dress, "That must have been a well-dressed man." His dandy-dandied surcoat would have satisfied the fourth George. His hat, which he puts on as soon as he takes his seat, is the best in the House, the most glossy, and the most juvenile. The Marquis of Bath would seem to wear a brim so narrow, and Carnarvon's Earl never were anything so unexceptionable at a *fête champêtre*. His trousers are innocent of a wrinkle; and Stalk, when he departed this life, must have breathed into the ear of the aged Peer the name of the man most worthy to succeed to his vacant throne. The cheeks of this venerable personage are destitute of whisker, whereby his face has been once or twice taken for Macready's. A clever scratch of Claude Melnotte elegance and juvenility knocks off twenty years from his age. Reader! the orator whom, a quarter of a century ago, you thought fifty, was then approaching sixty-five. The old man, whom you will hear presently—shamefully deserted and betrayed by his lower limbs, and whom you will pronounce to be a trifle over three-score and ten,—is fast verging upon his ninetieth year.

"Monstrous!" you will say. "Did any orator of distinction ever address a popular assembly at ninety?" Does history mention any such wretched old man? Does Homer venture to give such an age to the Nestor of the Greeks? Would not any poet put into the mouth of a man of ninety the counsels of childhood, and the suggestions of dotage? The feeble old man grasps the hand-rail, and with much difficulty gains his feet. His utterance is slow and mumbled, but there is no "childish treble" in the voice. It is the deep and manly bass of a quarter of a century ago, with a slight occasional tremulousness, infinitely touching, when he who speaks reminds those who hear that the valley of the shadow is before him,—that his tongue must soon be stilled, and his voice mute. At such moments the House of Lords presents a striking spectacle to the stranger in the gallery. The ministerial Peer can see the venerable orator without effort; but on the Opposition side every face on those crowded benches is turned to the aged Peer with an expression of deep interest and respect.

Does our British Nestor assert the privileges of his age by short, goosling, gurgulous speeches? Does he still engage in the party contests of his day, and contest with Lord Derby the leadership of the Conservative benches? Both questions must be answered in the negative. When Peel fell from his horse, and a great light was suddenly quenched, Wellington and Lyndhurst withdrew from politics. The survivor of that great companionship now breathes a higher, purer, serene atmosphere. No ignominious crummocked themes engage his oratory. Like the eagle of the sculptor, his arrows wing a strong and lofty flight at the king of birds. Is the Russian in the Principality? Is the Napoleonist despot menacing and torturing without trial? Is the Frenchman in Savoy, threatening Switzerland and the Rhine with his army, while his fleet is preparing to measure itself with that of England? Our Nestor of ninety makes shift to get up on his legs. With unswerving and elaborate power, and restless logic, he arraigns the offender at the bar of civilization and public opinion, charges the jury with judicial impartiality, and solemnly passes upon the wrongdoer the irrevoable sentence of posterity. When some great constitutional question arises, he is not content with a great speech, but shows himself capable of continued and stirring efforts. Three or four years ago we saw this wonderful old man thoroughly aroused and alarmed by a proposal to create life-peerages. Putting himself at the head of the opposition to the scheme, he examined the authorities, collated the evidence, exhausted the facts and arguments in one speech, and replied to all the views and assertions of his opponents in another. He took the chair of a Select Committee, cross-examined the witnesses, scrutinized the black-letter parchments, drew up the report, and triumphantly established the right of the Upper House to interpose between the Crown and the new scheme of life-peers.

For some months the contest was carried on. The hectic check became more flushed, and the lower limbs more impracticable. But the will was unconquerable, the intellect as clear, the brain as unclouded, as they were a quarter of a century ago. Peers who turned to that second bench above the gangway, looked significantly at each other, and exclaimed, "This will kill the old man." They were wrong. Since then he has warred us against the ambition of an incalculable ally. Since then he has inspired the Government to look to our first line of defence, and not to neglect our second and third. Since then he has vindicated the right of the Upper House to impeach and reject the financial

proposals of the Government. The old man, eloquent, does not pretend to be inflexible. The caution of age, nay, as he admits, veils in him upon timidity, and bolder counsel may be wiser counsel for a nation in the full tide of her youth and strength. But it is not to be denied that the aged orator rises to the heights of his great argument, and that the scene in the Upper Chamber on the now rare occasion when John Lord Lyndhurst is the centre of the picture, deserves to be painted by some royal academicians, not less eminent than the doubly celebrated father of the great lawyer and statesman.

AN IMAGINARY CONVERSATION.

RAYONABOLA AND THE PRIOR OF S. MARCO.

By WALTER SAVAGE LAMPON.

PRIOR: Hieronimo! my dear Hieronimo! Afflicted I have often been, but never so cruelly as now. Thou art abandoned to thy enemies, and there is no compe. The Holy Father has found thee guilty.

RAYONABOLA: Alas! how many hath he both found and made so! My Holy Father, our Holy Father who is in heaven hath indeed found me guilty, from my youth upward, yet hath He vouchsafed to show me the light of His countenance, and commanded me to utter His will. And now His right hand is guiding me on the road of expiation for my manifold sins.

PRIOR: Thy sins! thy manifold sins! What mortal ever lived more chastely, more charitably, more devoutly? And lo! the dus! O merciful Saviour! Can man's flesh endure the flames?

RAYONABOLA: Yes, that flesh which our Lord hath chastened.

PRIOR: Thou hast the courage of a martyr. Yet the first and stoutest of martyrs, our Lord Himself, prayed His Father that the bitter cup might pass from Him.

RAYONABOLA: It did not pass from Him. He loved His Lord on the cross, in obedience to His Father's will. Better men than I am have borne witness to the truth; and even I am deemed worthy to die for it.

PRIOR: Better men! None, none, none.

RAYONABOLA: Say not so. Providence hath seen it good that several of them lived longer and taught more efficaciously. Effeminate and vicious as our Florentines, they will spring up again into manhood. Wicked princes and wicked pontiffs have misgoverned, corrupted, and enthralled them. Conflicting strangers have trampled on them, generation after generation. Deliverers (so they called themselves, and were believed) have deluded them and bartered them away.

PRIOR: No people has ever been so prone to adulation; and what have they gained by it? The rind and stones of their own peaches and pomegranates—the drops of their own wine-presses. And this is the country which has longer been civilized than any other in Europe; which was flourishing a thousand years before Rome had risen from amid a mass of ruins, to be inhabited by robbers and murderers, who have left behind them a low valiant race, with similar propensities. The wolf has degenerated into the fox; the howl is softened into the whine, with an intermittent bark, and a more cautious prur about the sheepfold. After the example of Lorenzo, the worst *fourthaler* is become a term of reproach. Yet the more free our thoughts are, the nearer do they ascend towards the realm of truth, towards Him who alone hath given us the power of this ascending.

RAYONABOLA: Lorenzo, whose belief in God is doubtful, trusted to the wicked man who calls himself God's Vicegerent. That man is no Christian who assumes or permits to be styled "His Holiness," "His Beatitude," "Christ forbids His followers to call even him so. When I stood at the deathbed of Lorenzo, in order, at his desire, to hear the confusion of his sins, not one of the many and heinous did he confess, nor when I made any retrospection of what he had taken from every man in this country. "First of all," said I, "restore to the people the freedom bequeathed to them by their fathers." He turned round heavily on his bed, away from me. I left him. Peace be with his soul! if there be any peace where that soul is.

PRIOR: Why could he not have been contented with the eminence to which his fortune and his genius had raised him? No potentate in Europe possessed a third of his riches or of his residences. He commanded all climates: all exist in our little Tuscany. His feds no sharp winter—Proserpine no temperate heat. He commanded the breezes both of the ocean and of the Apennines. Here in Florence philosophers associated with him familiarly, and poets were often fed at his table.

RAYONABOLA: Their flybrows hastened his corruption. The constitution of the poetical mind is naturally feverish, and in most cases is corroded by the chronic disease of jealousy. He was subject to none of it; he saw no rival.

PRIOR: Jealousy, if ever pardonable, is pardonable in poets. There are more flowers than fruits upon Parnassus, and the pastures under it are luscious. Fit for the cattle. The songsters sit upon thorns, and clap their wings in conflict for a grain of millet.

RAYONABOLA: Not only poets, but graver men discoursed with Lorenzo. They might have taught him better.

PRIOR: They might have learnt better first. Their evenings and nights were spent in frivolous discussions and dissertations which they termed Platonic.

RAYONABOLA: Not improperly; for Plato's dialogues are mostly composed of cross-questions and quibbles.

PRIOR: Oh, the clever foolishness of false philosophy! We Christians know what true philosophy is, and where to find it, and who the teacher. It is better to be guided by Him in the roughest path, than to sit with idle chatterers.

RAYONABOLA: These Platonists remind me of a game at which children play when they have no better plying within reach. One lays his hand down flat,

another his upon it; and thus they alternate rapidly, until they are tired of the pastime. Then they slap each other on the knee, and run off laughing.

PRIOR: Nothing discomposes my Hieronimo. I never saw him before so near to facetiousness.

RAYONABOLA: I would rather think of children in frocks than of children in beads. Florence lies under my window, and I sadden at the sight of her.

PRIOR: Nevertheless, at this moment thou springest up alertly.

RAYONABOLA: Yes, yes; I am now a palm higher than I was. Florence, and the other fair cities of Italy, I feel assured, will be ashamed of their desolateness. Truth will supplant falsehood, activity will trample upon sloth. The Sun of Righteousness will shine again. The prophets of old will show their constancy through the thunder-cloud, and raise their voices audibly. Dante lies in his tomb at Ravenna, but his spirit will return to your city, and reanimate a people half extinct.

PRIOR: What rattle is that below? Where are those carts going?

It down, it down again,
What are they carrying?

RAYONABOLA: Faggots and stouter stakes, and one of them several ells long. How many poor half-starved creatures might these have comforted at Christmas! The people are impatient for their bonfire, and sacerdotal stomachs are yearning for their dinner. Remain here until all is over.

PRIOR: Hieronimo, my Hieronimo! must we meet no more?

RAYONABOLA: Hush! Most thou wilt knowest we shall: God alone knows when. Man's days are numbered; mine hath no numeral. May thou be so many as thy virtues, and as the blessings that are poured incessantly on thy head. Woe not; follow not one step farther; return to S. Marco when the smoke is blown over and is lost among the clouds.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

THE regret so generally felt for the death of two such men as Sir Henry George Ward and Mr. James Wilson, is greatly enhanced by the difficulty of filling up, at this conjuncture, the important offices of Governor of Madras and Financial Commissioner of India. Sir Henry Ward's success as governor in Ceylon and in Ceylon, pointed him out as the best man for Madras; whilst general assent of all parties picked out Mr. Wilson for the task of maintaining the finances of India. He gave himself so thoroughly to the work for four months, that he perilled his life. But he made so much progress in the work, that he left an easier task to his successor. Speculation is, of course, rife as to who that successor is to be. I believe I am far wrong in pointing to Mr. Laing, M.P., for the Northern Boroughs (Wick), and now Financial Secretary to the Treasury, as most likely to fill the post which Mr. Wilson held.

I believe that the thing dignified post of Governor of Madras—though not so difficult to fill—will be given to Lord Napier, whose experience in the public service at Naples, Constantinople, the United States, and the Hague, has given him the very best training for the place. Lord Napier has exhibited the highest talents, and has accomplished the most decided successes, wherever he has been employed.

There will also be another place vacant at the Council-board at Calcutta, on account of Sir James Outram's return to Europe in 21-th March. The "Old Indians"—that is to say, the Civil servants of the old Company—put in their claims for these high places in India, and do not want for *chapeurs* in their interest on all occasions. But the truth is, that there are too many of them in India already, and they are known to oppose themselves with the greatest pertinacity to the reform—military, civil, and financial—so presumptuously required by the new *regime*. We hope and believe that Sir Charles Wood will have the courage to resist their adherence to the old system, which has very nearly lost India, and reduced her finances to disorder.

I believe it was Lord Kilmorrough who declared that he knew the rules of the Queen's Bench to be stretched as far as India, to suit the convenience of the gentlemen who, in the old days of imprisonment for debt, abused themselves of the ancient privileges. Lord Palmerston, I am told, considers his country seat as sufficiently within reach of Downing-street, since the establishment of telegraphs, and the shortening of the distance to two hours by rail to Brighton, whence he can reach London so easily. He comes up when wanted, and, ordinarily, upon one day in each week. Lord John Russell is in town for the week, and will attend Her Majesty to Coburg and Berlin on Saturday. Sir Charles Wood is also in town, in constant attendance every day at his new office in Westminster.

The unexpected death of Mr. Joseph Locke is felt very much in his profession, so lately deprived of Stephenson and Brunel. He will be also missed in the House of Commons, where he was a very useful member. He was self-raised, and almost self-educated, and is said to have left property worth half a million sterling. His seat for Hoxton will probably be filled by his friend, Mr. George Moffat, who lost Ashburton at the last general election by the narrow majority of one.

From the best information I can glean, I look upon the Neapolitan question as settled. The talk of 50,000 royal troops behind Capua and Volturno, in defence of the king, is a myth. The reign of the Bourbons in Italy is a legend of the past. The stories of differences between Garibaldi and Cavour are all weak inventions of the enemy. They are both working for the same ends, with different instruments, and in congenial ways. The decrees of Garibaldi, of which I have seen the originals, are all issued in the name of "Vittore Emanuele, Re d'Italia." The Jesuits are expelled. The political prisoners are released. Ports—internal—are entirely abolished throughout all the Italian states. In due time we shall have railways and free-trade throughout the whole length and breadth of "United Italy."

The turn of the Pope is come. There was no doubt that Lamoricière would strike one last blow. Is that blow outside the walls of Ancona the last one? I believe it is, notwithstanding the speculations so cleverly indulged in by the French and English papers. The port of Ancona is blockaded by the fleet of the "King of Italy." There is no hope of Austrian aid from that side. The retreat of the mercenary army is also cut off by the fleet. A forced march through the mountains of the Abruzzi, surrounded by a hostile population, and without provisions, is out of the question. The Algerian general must yield, and give up his sword to the King of Italy elect, and not to the Lady of Loreto. Rome itself will be surrounded before many days. Garibaldi will meet with no serious resistance in his march from the south, and the legions of Lamoricière are already retired. What, then, will the Italy Father do? What can he do? "The intervention of Austria is at an end, for ever." So says one of the latest manifestations of the master of the French garrison at Rome.

The Pope, therefore, cannot look to Austria, as he used to do. Will he abandon Rome? I think not. He might not find it as easy to get back this time. He has no quarter to go to for a resting-place. He would do better to temporize, as popes have done before—open the gates of Rome to the army of Italy, and crown the brave king who is the choice of the united people. After all, this would be only exchanging foreign for native protection; and his person, as well as his ecclesiastical power, would be better protected by Italian than by Austrian, or even by French troops. If not in this mode, at least by some mode or other, I firmly believe is Garibaldi's promise to date from the Quirinal once more. The gates of Rome are played out, and even the College of Cardinals should better see the expediency of making terms, whilst yet they may.

As the season for country excursions draws to a close, the centres for public amusements in town begin to lester themselves for the coming winter campaign. It is notorious that last winter the metropolitan theatres in general did well. This was a good deal owing to the general prosperity and content, and to the fact of money—if not more plentiful—being more equally diffused. The success of the last season has given an impetus to that which is approaching. The notes of preparation are heard on all sides—even to the south and the far east of the metropolis. First in rank and importance is Her Majesty's Theatre, where opera—Italian and English—is sustained for every night in the week. The proprietors are perfectly right not to have this fine house follow in the winter months. The reign of exclusiveness has long passed away at "Her Majesty's Theatre." We doubt, however, the propriety of mixing up Italian and English Operas. Neither the stage, the orchestra, nor the audience, will work harmoniously together. The Italians are to have their old days, Tuesday, Thursday, and Saturday; whilst the English are to rule on Monday, Wednesday, and Friday. We fear it will prove. The subscribers on one set of nights, and the general public, at *piacimento* prices, on the other, will be always making mistakes, and creating confusion.

The Italian company is strong in singers; but where are the musicians to come from? The English company is also strong. We are promised no new operas; by Macfarren and Vincent Wallace, but Balfe is secured for Covent Garden; and there is nothing said of the ballet, which was always a leading attraction at this house. In the practical sense of making the most of his space, Mr. Smith has let the old concert-room—now the *Dionysa* Theatre, to M. Talry, late manager of the French plays at St. James's, for the performance of French comedies, vaudevilles, &c. How these varied and cosmopolitan performers can go on smoothly under one roof, and presented simultaneously, we are at a loss to determine.

The English opera at Covent Garden opens on the 8th October, under the excellent, and hitherto successful, management of Miss Frye and W. Harrison, with Mr. Alfred Mellon recouder, as before. This scheme is more simple and consistent, and more likely to succeed, more particularly as the pretty ballets of last winter—brief, but lively, are to be renewed. Balfe's new opera is finished; but the season opens with "Lurline," to be introduced with new stage effects.

The fine old patent theatre in Drury-lane is also to be opened on the 8th October, at cheap prices, as before. Mr. Smith has secured some valuable additions to his company, including Mr. and Mrs. Charles Mathews, Mr. Walter Lacey, Mr. Ryder, Mrs. Stirling and her daughter, who have all parts in the new drama in three acts, which Mr. Tom Taylor has undertaken for the opening of Old Drury.

Mr. Alfred Wigam has made a good choice, we think, in selecting the comedy actresses of St. James's for the display of his accomplished style of management. Although late in the field, he has secured the services of Mr. Emery, Miss Kate Terry, Miss Herbert, Miss Clara St. Clare, Mr. and Mrs. C. Young, and other favourites of St. James's and the Old Olympic.

The "Colleen Bawn" promises to have a long run at the New Adelphi, and richly deserves it.

The Haymarket, Princess's, and Olympic, go on as usual, and we trust with as much success as last year.

Mrs. Celeste has secured the valuable services of Mr. Krelly, as the Lyceum. The Fruit and Flower show at the Crystal Palace, opened for the last two days, was the most successful seen for many years. The wealth of fruit and flowers seems constantly on the increase, and the Crystal Palace is still the place to show it to advantage. The managers seem resolved to keep up the musical reputation of the Palace at Sydenham. Several musical entertainments are announced—the most prominent of which is the farewell appearance of Madame Clara Novello.

Miss Emma Stanley has engaged the second of the late Albert Smith's large rooms, at the Egyptian Hall, for a sort of drawing-room entertainment, to commence at an early date.

The grand colonnade Diormani in the Great Room at the Egyptian Hall, consists of various scenes in Europe—particularly of views in Sicily, and Naples; very interesting, just now, as an answer to public curiosity. The landscapers are

splendidly painted. The exhibition will have the advantage of excellent music under the direction of Mr. Calvert.

The works of the new metropolitan underground railway, from Paddington to the City, are advancing with great rapidity. When completed, it will be a most convenient line. It is expected to be opened to the public in about a twelvemonth.

Very praiseworthy is the determination amongst the authorities to insist, in every way, the constant desire of the public for instruction combined with entertainment. One of the most interesting memorials of a great man, and of a great day—such an one as is only experienced in an age—is about to be committed to a very proper custody. We refer to the Wellington car. Although its design was bad, its castings and workmanship have won the admiration of foreign artists at its exhibition at Marlborough House. It is a compound of steel, was constructed in three weeks, cost £16,000, and is now to find its home in a national collection, already rich in most remarkable and costly works, the Kensington Museum.

RURAL ECONOMICS.

AUTUMNAL AGRICULTURAL ORACLES.

Too many of our landlords seem to imagine that a part of their local duties—to which Queen's speeches so impressively refer—consists in praising, blaming, or encouraging the farmers. And it is curious to observe that this holding of any rural opinion. Nothing like a discussion takes place. The farmers are expected to receive the blame, the praise, or the encouragement with meek submission and silence, and they generally do so. Indeed, some extraneous topic of public interest, some national calamity, panic, or delusion, is commonly energetically worked by the landlord speakers, so as to prevent or interrupt any answers to their own or anyone else's things agricultural. The autumn always brings these lectures as it brings the harvest, and it may be well to try to extract some useful moral from the rural oracles of the present season.

Now, Lord Stanley is a public man of larger mental calibre than most of those who take upon themselves annually to lecture the farmers; and moreover, he is supposed to have somewhat more sympathy with industry, rural or urban, than most of his class. Yet at the Manchester and Liverpool Agricultural Association, when proposing success to the society he at once adopted the tone of a tutor. He thought nobody could

"Entertain a doubt as to the value or utility of associations of that kind. Farmers, by the nature of their occupation, live comparatively isolated and separated . . . If a man lives altogether at home, he is apt to think there is no farm like his, that there are no crops and cattle like his; and that he has not much to learn from his neighbours. If any Lancashire man has an illusion like that, it is an illusion a walk over the moor would very soon dispel; and if a man sits at home with his book, he can hardly help getting hold of some ideas which are worthy taking home and working out; he can hardly help going back and knowing more of his business than when he came." "Then such meetings, and his speech, "emulate that spirit of healthy emulation and rivalry, that emulation, which is the very soul of business."

Now, all this may be true enough, and is as obvious in the case of the farmer as in that of any other trader. He feels it in the market. It is impressed upon him at every fair he goes to, whether to sell or to buy. It is his interest and his business to note these things. But he often finds that he cannot keep or rear such good stock as some other farmers, because his farm is unimproved, his yards and sheds are wholly insufficient for good stock. His fields, perhaps, are too small and too much encumbered with hedge-row timber to enable him to cultivate his land so well as his neighbours with cleared land can cultivate theirs.

Such are the difficulties which beset the farmer, far more than any illiterate or want of knowledge of his business, and those difficulties are removable only by his landlord. Doubtless Lord Stanley can speak with more confidence on such points than many landowners, for the estates of his father, Lord Derby, are better managed in all such particulars, than the estates of most English proprietors. Then Lord Stanley told his audience—

"There has been very much accomplished of late years in the way of agricultural improvement. One man goes anywhere about England or this country, without seeing fences straggled, fields thrown together, cottages improved, waste lands reclaimed, and cultivation creeping up the face of the hills; but though there is a great deal done, some of us recollect what small farmers were apt to be in the old days before agricultural improvement was thought of."

The natural remark on this is—What have the small farmers to do with such improvements as Lord Stanley referred to? They could be done only by or with the co-operation of the landlords. Such lectures and suggestions might really be very useful in a meeting of landowners, whose apathy or prejudices alone retard the improvements which naturally would take place in English agriculture. We are glad, however, to see such authority, that so great improvements have been made in Lancashire; for in 1840, Mr. Garnett, who obtained the prize of the Royal Agricultural Society for his Essay on the Farming of Lancashire, said,

"The county of Lancashire is a very important one; but most anomalously its importance does not arise from the excellence of its farming. . . . We are sadly behind the rest of the world in agricultural attainments, and our troubles, the North-Western Railway, from the time of his moving to the time of his quitting Lancashire for Westminster, must leave it with the impression that he has been passing through an ill-drained, badly-cultivated, and neglected district."

We fear a traveller going over the same ground now would agree more nearly with Mr. Garnett than with Lord Stanley's report.

At the time after the show of the North-Western Agricultural Society, the Duke of Northumberland, the patron of the society, providing, having referred to the excellence of the live stock which had been exhibited, and having given some statistical details as to the arable and moor lands of the county, said that, during the last ten years,

"About 170,000 acres of land had been drained, at an expense of £5 per acre; and this is about one-fourth of the whole arable land of the county. About £200,000 or more has been spent within the last ten years on draining; and perhaps

as much, or nearly as much, on other permanent improvements. Now, the result of this increased draining is an increase in the amount of production, more cattle and larger farm-buildings; so I think the country may be well satisfied with the improvements of the last ten years."

Now, the duke did not tell his audience how much of this sum had been spent by the landowners, and how much by the tenants; nor how much of it consisted of loans made to landowners by Government or land improvement companies, repayable by small annual instalments. Neither was there any hint of the possibility of such loans of which the repayment had been thrown wholly on the tenants. Neither can it be said that draining, equal in amount to the fourth of the arable land only of so humid a county as Northumberland, and where by far the greater part of the arable and other lands require drainage, exhibits any extraordinary degree of activity for a period during which agriculturists have become fully alive to the necessity of self-reliance and energetic improvement. We do not hesitate to say that, if the landed proprietors of Northumberland had been, during the last ten years, willing and able to grant their farms on long and rational leases to tenants of competent means, something more like three-fourths of all the land—pasture and moor, as well as arable—would have been drained. Does not this justify those who say the patrons of agriculture—why should agricultural industry alone require patronage?—are fond of "paralysing its progress, have talked and told how much has been done, while others are satisfied to work subject to the most active competition?" Then the duke referred to the improvement of the agricultural labourers' dwellings, for which the duke, as regards his own property, is entitled to much credit; and the advance of their wages, "something like 13 per cent. in ten years." But then he said higher wages increased "the expense of cultivation."

"Now, here is our problem—here is the great difficulty: How is the expense of cultivation to be lessened? The use of the steam-plough has been tried, but it is not yet practically successful; that is, it is not yet brought into general use. . . . Still, therefore, the problem remains—how are products of agriculture to be raised more economically, our land, at the same time, being kept equally good, and everything else being kept to its level? The produce of the land should be increased as the population increases. Whilst stating this problem, I must add that I have no doubt whatever that English energy and English determination will ultimately solve it. I have no doubt that means will be found, by steam or horse-power, to cultivate the land economically."

Neither have we any doubt that English agricultural energy can solve the problem, which, however, is not quite that stated by the duke; but that such energy must have fair play. It must not be asked to display itself in fetters. The real problem is—How can the products of agriculture be increased with profit to the producers?—for otherwise there will be no increase. Now, profitable production is to be obtained, not so much by lessening the expense of cultivation, as by the increased employment of such agents—mechanical, manual, or animal labour—as the farmers having secure possession of their farms may find it conducive to their own interest to employ. We believe the problem must be solved by greater outlay, to result in still greater proportionate production. To this end security is the first, the indispensable condition. Just look at the state of that security on the duke's own estates, and on those of nine-tenths of his fellow-landowners in Northumberland. How many of the tenant farmers in that county dare kill the wild animals—the game—which infest their farms and devastate their crops? How many dare to vote against the county candidate, supported by their landlords, without being "dismissed" from their farms? We pause for a reply.

POPULAR SCIENCE.

A VISIT TO THE GREENWICH OBSERVATORY.—No. I.

THE METEOROLOGICAL DEPARTMENT.

Or all the hundreds of thousands of pleasure-seeking Londoners who have been to Greenwich Park, few know anything of the Royal Observatory. They know the outside well enough. They are familiar with the graceful deer browsing on the verdant herbage beneath the tall firs that beautify the park. Hundreds of them have promenade round the red-brick house perched on that steep hill, down which merry lads and lasses have run or rolled on merry days, and some have looked with excited wonder at the curious cupolas with odd projecting pegs; the vanes, and posts, and balls; and at the tall mast rising high above the trees, with its ropes and wires, and queer suspended box. And those they have looked at without a chance of their curiosity being satisfied, and without the remotest idea of how the work inside was done. Of course they know that the stars were observed, and that eclipses were calculated there,—but beyond this vague conception all was mystery to their idle minds. So they looked at the massive gates, beside which the electric clock ticks solemnly night and day, and points its finger to the passing time,—and walked away, and wondered on.

The exclusion of the public is not merely justifiable, it is necessary; the workers inside that secluded area are not too numerous for the work they have to do; the instruments they have to work with are often of extreme susceptibility, and the operators themselves have to be punctual to seconds in their records and their labours. Interruption under such circumstances, would be fatal to their duties. Few thoughtful persons, even if not astronomers or meteorologists, but must take pleasure in knowing the details and means by which the facts of astronomy are ascertained; while of the most thoughtful some might be arrested in their trifling by such a knowledge, and perhaps be changed to humble but useful workers in the wide fields of science, where daily stand abundant crops and rich harvests ungarthered for lack of labourers.

On entering the Royal Observatory, I, Jones, or whatever my name may be, first passed by a narrow way to the small grass plot where stands the tall mast and the wonder of the passengers' eyes outside. Behind it is a low white building in the form of a cross, where Mr. Glaisher and his assistants superintend the magnetical, meteorological, and electrical apparatus. From the wooden box at the masthead

a copper "exploring-wire" is seen passing across to the roof of the astronomical observatory, and another copper wire is seen passing down to the window of the ante-room of the low white building we have just noticed.

FIG. 1.—a, mast; b, c, copper exploring-wire, for collecting electricity from the air; d, wooden box containing glass insulators; e, f, iron wires from mast, on which the box, e, slides; f, conducting-wire to meteorological observatory; g, h, metal connection; i, j, l, conductor to apparatus; k, umbrella protecting the opening in the roof of the observatory window; m, n, o, p, glass insulator; q, r, s, two boxes containing the flames of two gas jets, e, v, p, p, copper cylinder; e, v, metal connecting-rods; t, bottom of window screen; u, v, x, z, z, rods for making each connection, to carry off dangerous quantities of electricity. The instruments are—1. Gold-leaf Electrometer; 2. Light Sheet Electrometer; 3. Heavy Sheet Electrometer; 4. Dry-plate Electrometer; 5. Galvanometer; 6. Spark Measure; 7. Foil Ball Electrometer.

The first, or "exploring-wire," gathers the electricity; the second, or "conducting-wire," passes it down to the window, inside of which the examining apparatus is placed, and the primary objects of which are to determine the quantity, the quality, and the variations and conditions of the electricity in the atmosphere. For it is not only when the lightnings flash, and the thunder-peals, echoing, roll from cloud to cloud, that electricity is present in the air: it ever abounds there, and in the earth itself, at all times; like a breath of life it seemingly pervades all nature, and its presence is manifest alike in the rustling of a lady's dress, the crackling of a sheet of brown paper, or in the most destructive storm. In another form it is our familiar slave, to carry our messages from town to town; and from lands a thousand miles apart, in the sunken wire "the hands of human brotherhood clasp beneath the sea."

What a strange thing is this lightning, electricity!—call it what you will. We can collect it, but we cannot see it; we can pass it like water from jar to jar, but we cannot measure its bulk, nor weigh it; all we could accumulate will not add a fraction of a grain in the balance; we can change it from a flaming flash to the steady current of galvanism, into heat, into motion; or we change the current into the flash, or from heat or motion eliminate its brightest sparks. We can bring down the death-dealing lightning with a copper thread, and, playing with it as with a toy, repeat all the poetry extant in the legends of the East. And yet we cannot tell you what it is. We can observe it, learn its powers and effects, we can, do with it what we will; but, impalpable, invisible, we cannot describe it.

But if we cannot describe the lightning, we can the apparatus which gathers it, and puts it in our power.

The first thing necessary to do with the copper exploring-wire is to insulate it,—that is, to prevent the passing-off of the electricity at either end, and hence each end is attached to a cone of glass. Now, although glass is a non-conductor, and bars the progress of electricity, yet water is a conductor, and facilitates its passage; thus if the glass cone be saturated, the electricity might pass along the watery surface, and escape. Electricity, too,

* An order from the Admiralty is necessary to inspect the Observatory.

always follows the shortest route to the earth, where a choice is left it—and a shower of rain might convert the mast or its ropes into admirable conductors; and the electricity might pass in this manner to the earth, instead of along the wire intended to bring it down to the examining apparatus. It is, therefore, above all things, necessary that the insulation should be perfect; and this is effected by means of a small flame, or of a lamp or gas-jet. Let us draw a glass cone, just to illustrate this. (See woodcut, Fig. 2.)

In the hollow of the cone gently burns the gas-jet. Just feel the glass: at the top it is red, the base slightly heated, between these two points, then, there must be a space (f, f, f) which is neither hot nor cold, but which must be perfectly dry. This space may be an inch or two higher to-day, or an inch or two lower to-morrow; but there must be, at some intermediate point of the cone, a space which is perfectly dry, and this space must be a perfect non-conductor—an effectual barrier to the electricity—an obstacle it cannot surmount. We have then only to attach our wire above this space to make certain that none will pass off at this end of it. By means, then, of another glass cone, heated in the same manner by a little flame, we can make sure that none will escape at the other end; and by attaching a conductor to our wire, we can bring down the electricity collected by any spot that we will.

By the glass cone, then, on the Observatory, or another in the wooden box at the mast-head, both heated in the way we have described, the "exploring-wire" is perfectly insulated; and by the copper conducting-wire (Fig. 1, f, f, f) attached to it at a short distance from the mast, the electricity is, or ought to be, with certainty, brought down to the white house, or magnetic observatory.

The situation of the Greenwich Observatory is, however, very bad for electrical observations, on account of the numerous trees in the vicinity, which act as so many electrometers to carry of the electricity of the locality.

To obviate this, the mast, no less than the feet, and there is consequently a great loss of electricity by portions passing off to the different strata of air, which it meets with in its passage along to conductor, to the Observatory.

The cut Fig. 1 also represents the electrical apparatus in the window of the ante-room. Here, again, it is necessary to provide against the electricity passing away in any other than the intended direction towards the instruments; and therefore, on either side of the metal bar which conducts it to the long copper cylinder is fitted a bar of glass, which is heated, like the insulating cones of the "exploring-wire," by a small gas-jet. At intervals metal arms pass through and in these arms are fixed the connecting-rods pass downwards, the bulbs of which can at pleasure be brought into approximation or connection with the respective instruments. These consist of a double gold-leaf electrometer, two Volta electrometers—one of light, the other of heavy straws, and a Henley's pith-ball electrometer, for measuring the intensity, or quantity of the electric force, and for determining its quality, or kind; a galvanometer; and a "spark measure." It may be interesting, however, and useful, to describe these instruments more at length.

The electrometers are constructed on the principle that objects, similarly electrified, repel each other. The electricity passing down metal bars from which gold-leaves, straws, or pith-balls are suspended, electrizes them similarly, and the tendency which they then have to repel each other causes their lower and free extremities to diverge more or less, in accordance with the quantity of electricity with which they are charged.

The double gold-leaf electrometer is extremely sensitive, and the first to be excited; the light straws of No. 1 volta follow, and are succeeded by the heavy straws in No. 2, as the electricity increases in intensity; and lastly, the Henley's pith-ball is set in play, but seldom until the volta No. 3 has indicated 100 divisions on its scale.

The dry-pile electroscopie has a single strip of gold-leaf placed over a dry glass or dry ivory piling, which have the power of maintaining a permanent charge of electricity at their summits, and are so arranged that positive electricity is developed at the one and negative at the other. Quietly the gold-leaf, in its natural state, hangs down between them; but no sooner does it receive the opposite electricity, and repelled by the other having the like electricity to that with which it is charged. So sensitive is this instrument, that a stick of gum-lac rubbed on a cloth will produce a sensible effect on the gold-leaf at a distance of nine or ten feet.

The "spark measure" consist of a vertical sliding-rod terminated by a brass ball capable of being raised towards or depressed from one of the connecting-rods of the copper cylinder by means of a brass lever with a glass or wooden handle, and to which an index-had is attached, pointing to a scale below, and indicating there the distance from the ball of the connecting-rod to the brass ball of the "spark measure," and consequently the distance at which a spark will pass from one ball to the other, or its length, is thus shown.

Besides the ordinary or static electricity in the air, which manifests itself by sparks, or flashes like lightning, there are continuous or galvanic currents, for the investigation of which the galvanometer No. 2 is employed. This instrument consists of two large magnetized needles suspended by a split silk fibre, one over the other, with their respective north and south poles reversed, technically termed a static balance. The galvanic current is passed along a fine wire, of 2,400 coils, and is thus so intensified that the slightest current, which in itself would be imperceptible, becomes palpably evident in the deflection of the needle over the circular index-scale. This instrument indicates only the electricity which passes in a continuous current; ordinary static electricity which passes by jerks or sparks does not

affect it. While I stood in the observatory, a hasty shower came on, and the rain pattered fast on the window-rod. Before I had scarcely taken my eyes from the sky, in their natural upward look, the time of the shower had been noted, the electric instruments put in full play, the straws in the voltae were diverging and collapsing, and the gold-leaves and pith-balls vibrating to and from the brazen knobs, as the electric sparks snapped, now loudly, now faintly, from the conducting-rod of the copper cylinder to the rigid little "spark measure" thrusting out its immovable hand to the marked length on the index. Soon the shower ceased, the sparks snapped fewer, the straws in the voltae, that before had opened and closed like the kicking legs of wooden merry-Andrews, when children pull their strings, hung down again, and the pith-ball drooped beside its brazen rod, and there was a return once more to the old quiescent state, as it was before this short and sudden disturbance.

The fall of rain was measured, the indications of the electrometers and galvanometer set down, the purple colour of the electric sparks noted,—all without the slightest confusion, each assistant having his appointed duties; while an ordinary observer would scarcely have known that anything unusual had been going on.

HEALTHY HOMES.

We know no subject that ought to be considered of more interest and importance to everybody than that of healthy homes. Homes are the places where our first and most lasting impressions begin; and they continue associated with our thoughts and recollections to the last moment of our lives. Next to parents, relations, and friends, their perma-ent, earthly things, have the most permanent influence over our character. As they are spacious and comfortable, so will be our ideas of what is proper and agreeable. As they are clean, well-arranged, decent, and all things in them are well ordered, so will men and women grow up to be fond of neatness, and be inspired with the spirit of order and good taste. They can do more for the character of people than the cultivation of the Fine Arts. There prevails still almost a fierce ferocity in the country most renowned for the cultivation of these, but where the homes of the people are the hovels of the dark ages. The rural population of England is not remarkable for delicacy, that of Scotland still less, and household accommodation for them is notoriously bad in both, and worse in Scotland than in England. In both great improvements are required, and we notice with satisfaction a book intended to help those well-inclined landlords and others who some time ago began and still continue to promote this necessary social work. No good can be effected from any scheme which does not combine advantage to the builders and the tenants of cottages. Where they are built on a man's own land, and he is subject to poor rates, he has the strongest pecuniary interest in providing houses that shall contribute to keep men healthy. In the work before us the interest of both classes is considered, and the profit of the landlord is constantly kept in view, as well as the comfort of the tenant.

These houses should be well drained, and provided with conveniences for carrying off or disposing of the refuse of the inmates, well supplied with water, and so substantially built as to secure them against all the inclemencies of our climate, are indispensable. These are great considerations, and no expense should be spared to secure them. A plentiful supply of water is also indispensable. For the small space really required for a house, little rent should be demanded, the chief payment required of the tenant should be for the conveniences supplied.

Our woodcuts give the plan and elevation of a cottage containing a living-room 11 by 9 feet, scullery 9 by 3, parents' bedroom 9 by 7, girls' bedroom 6 by 6, boys' bedroom 6 by 6, pantry 6 by 4, place for fuel 4 by 4, for tools 4 by 3, and a pantry 4 by 3, which may be built for £42. 5s. 10d.

The floor of the living-room is to be 2 inches above the ground outside, with a six-inch step to door of porch, and a 6-inch step to floor of the scullery. The floors of the bedrooms are all on the same level, the floor of the scullery is 6 inches below them, and the floor of the back porch 6 inches below the floor of the scullery. The height of the rooms against the outer wall is 7 feet, the other part of the ceiling in the room is 9 feet high. The ceiling in each bedroom is supplied with bands of perforated zinc, leading the contaminated air into the space between the ceiling and roof; chimney shafts to be formed with a ventilating flue by an air-brick will draw the place in thorough repair. To this sum must be added the rent for the spot on which the house stands, which will vary according to the neighbourhood. Of course it will be somewhat higher in towns, which has suggested

constructing, in them, lofty buildings, let out in chambers or flats. With this addition, whatever it may be, such a house, let for 1s. 6d. a week, would pay the builder, and supply the tenant with a healthy house. In our opinion the author does not make a sufficient allowance for the reduction of cost which would ensue were many such houses built of the same size, and requiring all exactly similar wood-work. It may be hoped, too, that long low timber dwellings will be repeated, which will enable builders to construct such houses still cheaper. When these duties are repealed, and when landlords have built a sufficient number, or still larger number, for which there are many plans in Mr. Bernard's book,* which also contains much practical information, nearly everything which they and the state can do to improve the homes of the people will be done, and they may, and indeed must, then trust them to their own exertions.

INDEED LETTERS OF LORD NELSON.

[Continued from p. 254.]

THE following are the letters alluded to at the close of our last article as having been addressed to the Earl St. Vincent by Sir William Hamilton, in whose handwriting they are preserved. One of them is described in a memorandum attached to it by Sir William, as "a very important despatch," containing "interesting details" concerning the great French armament which sailed from Toulon, with Buonaparte as commander-in-chief:—

NAPLES, June 10th, 1798.

MY LORD,—I was honoured with your lordship's most flattering letter of the 22nd of May, last Sunday, by Captain Bowen of the *Trenton* ship of war, and immediately communicated its contents to the Government and to your lordship's ministry. Your lordship may well imagine how welcome the news of a powerful and well-chosen British squadron being on its way to protect the Two Sicilies was to their Majesty, who had not before received the account of the Toulon armament being on the coast of Sicily.

The following is the account that this Government has hitherto received relative to that armament. The first division arrived on the Sicilian coast the 6th of June, and the second, which completes it, joined them there the 7th of June. They were then, according to the list I received from General Acton, 16 sail of the line, 10 frigates, 20 gunboats, some armed brigs and cutters, and about 280 transports with troops, mail to amount to 40,000 men.

General Buonaparte, commander-in-chief, was on board the *Saint Calixte*, as were all the savants, naturalists, mathematicians, &c.; it is said (I have seen) not less than 2,000 men on board that ship, which, as well as the other ships of war, appear visibly to be much encumbered with lumber of all sorts.

They remained between Trapani and Marsala for a few days, and General Buonaparte sent an officer to the Governor of the Kingdom of Sicily, and to assure him that His Sicilian Majesty need not be under any alarm from the fleet, as the French Republic was in perfect peace with His Majesty, and that the armament had another place, not Sicily, for its object. On the 8th instant they went off towards Malta. Yesterday the Sicilian Majesty, who dated the 10th of June, from the Governor of the island of Pantelina, saying that a French gunboat had been at that island, and wanted to land, was not permitted. An officer said that he came from General Buonaparte, who was, with 22 ships of the line, 80,000 men, off Malta, and that he had been informed by the Governor of the island that he belonged to the King of Naples, he said that advised the case, as he thought it belonged to Malta, and went off very civilly. He asked many questions relative to the report of a British squadron being in the Mediterranean, which they had been informed of by the Sicilian Majesty, and were asked the same, and were answered that for two years past they had not seen British colonies, except on board some Gibraltar privateers. The same feelings that brought this news from Pantelina said that the great armament was lying off Malta, and had taken a large Maltese brig, and that the Maltese were alarmed, and preparing for a vigorous defence.

This morning this Government has received advice from the island of Ischia, that yesterday evening, from the top of a high mountain in that island, they had seen a fleet of 14 ships of the line coming from the westward, and running S.E. and S.; if it, it can be no other than Sir Horatio Nelson's squadron. I have sent off at a hazard a Maltese spyglass, with a letter for Sir Horatio Nelson, with the above-mentioned information, which is as much as we know here, and which may be of use should the spyglass have the good fortune to fall in with the squadron. I have kept Captain Bowen some days, much against his will, with the hopes of being able to send your lordship some certain accounts of the British squadron.

I had word from Sir yesterday. This morning early, June 17th, Captain Hawley, in the *Muffin*, arrived here, and brought Captain Troubridge, of the *Catfish*, in which, Admiral Nelson remaining off of this day at such a distance that the hulls of the ships were no discernible. Captain Troubridge gave me letters from Vice-Admiral Sir Horatio Nelson, desiring to be informed of the ports of the Two Sicilies were open to the King's ships without limitation, and whether they had free liberty to provide themselves with all sorts of provisions and stores in those ports.

The answers to these questions your lordship will find in the enclosed copy of the Marquis de Gallo's (present Secretary of State for Foreign Affairs) answer to an official bill I wrote to His Excellency, by order of Lord Grenville, demanding a categorical answer to these important questions. I have likewise sent a copy of the same to Sir Horatio Nelson. Your lordship will find, by the Marquis de Gallo's billet, that this Government is waiting for an answer from London, and from Vienna, before they take the decided part of joining us openly; but that every assistance that can be given to the King's fleet in the Mediterranean that would not be a direct violation of their treaty with the French Republic might be depended on. I carried Captain Troubridge to the Earl St. Vincent immediately to General Acton, and they were much pleased with the answer given to them by that minister, who still remains all-powerful in this country. Captain Troubridge having expressed a desire to have an order to the commanders of all the ports to supply our ships with provisions and stores, in case of an action, to be permitted to land the sick and wounded in those ports, the General was so good as to give him such a written order, in the name of His Sicilian Majesty, signed by himself, and addressed to all the several governors of the different ports in Sicily.

Captain Troubridge was perfectly satisfied with General Acton's declarations of

friendship. I really believe they were sincere, and that this Court will declare, as it certainly ought, that it joins with us without reserve against the treacherous enemy, as soon as it can, and that in the mean time every concerted assistance will be applied to the British fleet, on which the very existence of this monarchy depends at this moment.

Captain Troubridge did not stay above two hours on shore, and is now on his way to join Admiral Nelson, off the island of Capri, having got pilots to conduct him through the Straits of Messina, in order to reach Malta, where the French armament certainly was on the 8th instant, and where I hope Admiral Nelson will find it. I am assured by General Acton that the Grandmaster at Malta is prepared, and will make a vigorous resistance if attacked by the French; and that he has sent out one of his ships of the line and a frigate with orders to look for and join Admiral Nelson's squadron. This is all the information I can give your lordship at present; but I flatter myself that the brave and powerful squadron which your lordship has chosen for the protection of these kingdoms, will in a few days give occasion for my sending off a quick-sailing vessel, to give your lordship some joyful tidings.

These Sicilian Majesties have very particularly enjoined me to express to your lordship their grateful sense of the eternal obligation they feel themselves under to the British nation and to your lordship in particular. General Acton received your lordship's compliments with infinite satisfaction, and desires to be kindly remembered to your lordship, and that I would assure you that he will do all in his power for the comfort of the British squadron in the Mediterranean. I look upon my having detained Captain Bowen so long as a fortunate circumstance, as I am by it enabled to give your lordship intelligence both of your squadron and of the French armament.—I have the honour, &c.

St. Vincent, June 19th, 1798.

MY LORD,—I have only to add to my despatch of yesterday's date to your lordship, that this Government received last night the account from Malta of the French leaving, on the 10th instant, taken possession of the island of Gozo, near Malta, and landed a body of troops at Cuka St. Paolo, north of the harbour, thereby making the most important and comfortable for any expedition, and giving me this intelligence, adds that he foresees that this operation of the French general must necessarily bring on a rupture between the French and the Neapolitans, as the King of Naples (the knights being removed) has the least doubt that the French will attack Malta, the chief of Malta, being a most favourable circumstance for Sir Horatio Nelson, who will now most probably surprise General Buonaparte in the midst of his operations against Malta; and we flatter ourselves here that the Valletta may hold out many days longer, and without the possession of which the French will be unable to have any shelter from the British thrasher that threatens and approaches them.

Captain Bowen will give your lordship an account of your squadron, having been out with Admiral Nelson.

May I take the great liberty of recommending Captain Bowen to your lordship's kind protection. He is a nobleman, a man in Flanders, and a relation of Mr. Merrick, who has been so good as to superintend my estate in South Wales whilst I have been employed here, and who is much interested in Mr. Bowen's welfare.

I have the honour to be, &c.

Lord St. Vincent acknowledged the safe arrival of these letters, by the hands of Captain Bowen, in the following terms:—

Ville de Paris, off CADE, 15th July, 1798.

SIR,—The *Transfer* joined last night, and brought me your Excellency's welcome letters with others equally comfortable for any expedition, and giving me this intelligence, adds that he foresees that this operation of the French general must necessarily bring on a rupture between the French and the Neapolitans, as the King of Naples (the knights being removed) has the least doubt that the French will attack Malta, the chief of Malta, being a most favourable circumstance for Sir Horatio Nelson, who will now most probably surprise General Buonaparte in the midst of his operations against Malta; and we flatter ourselves here that the Valletta may hold out many days longer, and without the possession of which the French will be unable to have any shelter from the British thrasher that threatens and approaches them.

In the event of Sir Horatio Nelson's success, I will appoint your friend, Captain Thomas Bowen, to the command of one of the captured ships. I should have given him the rank of post-captain more than three years ago, but for his bad Welsh luck.

Assure General Acton of my perfect esteem and regard; and I beg you will do me honour to accept the same from your Excellency's very faithful and obedient servant,

ST. VINCENT.

P.S.—The *London* of 61 guns, *L'Éclair* and *Thémis* of 38, are on their passage up the Mediterranean, to join Sir Horatio Nelson.

The *Seahorse* captured *La Scyllie* within six leagues of Malta, with all the Bala which General Bugeaud d'Albiers was ordered to lay at the feet of the recovery, on the 15th and 16th instants, and the French Admiral long ago. I enclose an extract of a letter found on board *La Scyllie*.

General Bugeaud d'Albiers, his aide-de-camp, with the Bala, are on their voyage to England in the *Succes*, and *La Scyllie* is registered in His Majesty's navy, and I expect her every hour from Gibraltar.

St. V.

[To be continued.]

THE "ORIGINAL SHAREHOLDER."

LANTIERE LANTIERHEAD, the puppet showman, in Ben Jonson's "Bartholomew Fair," knew the difference between the magnificent and the profitable, and "Niverville" was a stately thing, "exclaims that discriminating manager; 'so was Jerusalem; but the Ginn-powder was the get-up-pany!'" He admitted the grandeur of colonial architecture, but his heartiest commendation was for that which paid,—which he "had presented to a one-and-innepenny audience, thrice in an afternoon." So Niverville and its unrenowned stables was discarded for the profitable coal-cellar at Westminster.

The work done and intrusted to that miserable clown, have some more? I disapproved not in respect to this auxiliary force; but by the aid of Don Rodrigo de Souza Coutinho, Minister of Marine, and the only "man" I have found in the country, I think you may count upon seeing these soon, for the marquis is instructed to proceed coastwise, and so on to Naples.

In the event of Sir Horatio Nelson's success, I will appoint your friend, Captain Thomas Bowen, to the command of one of the captured ships. I should have given him the rank of post-captain more than three years ago, but for his bad Welsh luck.

Assure General Acton of my perfect esteem and regard; and I beg you will do me honour to accept the same from your Excellency's very faithful and obedient servant,

ST. VINCENT.

P.S.—The *London* of 61 guns, *L'Éclair* and *Thémis* of 38, are on their passage up the Mediterranean, to join Sir Horatio Nelson.

The *Seahorse* captured *La Scyllie* within six leagues of Malta, with all the Bala which General Bugeaud d'Albiers was ordered to lay at the feet of the recovery, on the 15th and 16th instants, and the French Admiral long ago. I enclose an extract of a letter found on board *La Scyllie*.

General Bugeaud d'Albiers, his aide-de-camp, with the Bala, are on their voyage to England in the *Succes*, and *La Scyllie* is registered in His Majesty's navy, and I expect her every hour from Gibraltar.

St. V.

[To be continued.]

What a list of "stately things" we can recall! They were all grand,

* Healthy Moral Homes for Agricultural Labourers, showing a fine investment for Lady Jode, with Great Advantages to Tenants. By G. Vincent Bernard, a Practical Workman. With 60 Illustrations. Rivington.

asserts that hand-feeding, with care and management, and by a judicious mixture of the cereals with cow's milk, is more wholesome for the child than the milk of a woman not its mother. And this opinion she founds partly on the unreasonableness of the latter practice. "Offended nature undoubtedly points out, in a very remarkable manner," she says, "that if the infant be denied the nutriment which is its birthright, a stranger's milk is not a fitting substitute." Yet, inasmuch as one woman's milk is more like to another woman's than it is to a mixture of cow's milk and corn, it would seem without question that a woman's milk should be the best substitute for the mother's, in those cases where this is wanting. Experience, too, proves that Miss Beines is wrong.

All medical men, almost women, can count up on their fingers cases within their own knowledge, where the most careful and scientific hand-feeding failed, and the child was obliged to be put to a stranger's breast as the only chance it had of life. Simply recording this protest, because we think the doctrine physiologically unsound, and experimentally untrue, we heartily concur in all that this subject has sought to impress on the public. We cannot too strongly insist on the cruelty and wickedness of the practice, on the infinite moral mischief attending to both mothers and to both children, on the confusion created in the minds of the poor erring girls who see themselves specially selected for their first fault, and favoured and rewarded for their second,—whose uncharitableness leads them to the kindly notice of indolent mothers and time-serving doctors, and whose cruel abandonment of their child leads them afterwards to a fine place, fine clothes, fine food, and some nine or ten months of pampered superiority over every other servant in the house. Only in the case of actual need, when the little life is dying out for want of that food which the mother cannot give, and of which no other child is hardier, and the blessing of the breast is the only way to save one life without endangering another, ought the practice of wet-nursing ever to be adopted. But as a substitution, because of a mother's own idleness, or unnatural dislike to the restraints of her position, no words can too severely scold those who lay, or those who sell, that precious gift which God gave to mothers as the most blessed and precious of all humanities. The sickly refinement which revolts at the honest breath of Nature cannot understand what is lost by this fatal fashion; the vain, the weak, the worldly, the unloving, those to whom pleasure is more than love, and self beyond maternity, think they have done their duty when they dry up their own founts of life, and stretch the child from its mother's breast to lay it in a stranger's arms. Society upbids them; nay, society applauds. It is not the "fashion" for women of a certain rank and calibre to nurse their children; and few women are sufficiently heroic to withstand the demands, or oppose the follies of any form of fashion whatever. We wish it were otherwise for their sakes, and for the children's, and for the progress of the world at large. "Fashion" is the up-stare under which modern womanhood has sunk to sleep: it not speedily aroused, that sleep will change to death.

INVENTIONS AND DISCOVERIES.

UNDER this head we intend to publish, from time to time, a series of articles that shall keep our readers *en courant* with all the most important and interesting facts connected with the progress of science. We commence by a description of an approved method of making

SUBMARINE CABLES.

As our readers are constantly hearing of Atlantic cables, Red Sea cables, and other submarine cables, it may not be uninteresting if we give a general idea of the construction and mode of manufacturing these cables, and of some of the recent improvements by which it is expected to ensure greater durability and more satisfactory results than have hitherto been attained.

An ordinary electric telegraph cable consists, in the first place, of a copper wire, or a strand of several copper wires twisted together. This wire, or strand of wires, is the conductor through which the electricity is to pass. If this wire were immersed in water, the electricity would pass out on all sides into the water, and none of it would reach the distant instruments. It is necessary, therefore, to wall in the electricity by a non-conducting substance incasing the wire. In the cables hitherto in use gutta percha has been employed for this purpose. In order to give greater strength to the cable, and to protect it from the attacks of marine animals and from abrasion on a rocky bottom, it has been covered by iron or steel wires laid round it in a long spiral or helical direction. The exterior thus assumes the same appearance as any other rope of iron or steel.

The mode of applying the gutta percha to the wire is very simple; a machine like a large squirt or syringe with its plunger or plunger as a piston. The bottom of the cylinder is closed, and it is filled with hot plastic gutta percha, which is kept heated by steam or otherwise. The piston is put in and pushed upon the gutta percha, which is thus ready to escape at any hole in the cylinder. At one side of the cylinder, near the bottom, is a hole about the size of a sixpence. Exactly opposite the centre of this hole, in the opposite side of the cylinder, is another smaller hole, which is just large enough to admit the wire, which is passed through it and through the centre of the larger hole. Pressure is now applied to the piston, and the plastic gutta percha is thus forced out at the larger hole, and by its adhesion to the wire it drags the latter with it. We have thus a continuous stream of gutta percha being forced out of the machine.

Now, having obtained our gutta percha-covered wire, the question has arisen, whether, after all, we have made use of the best materials within our reach? It is found by experience that there are frequently flaws in the gutta percha, owing to little bits of dirt or splinters of wood, which, when the covering is actually pierced by a flaw, it may be ascertained in the process of testing the cable; but when the flaw only passes nearly through, it is not discovered until perhaps the cable has been immersed, and the flaw has extended quite through, and splits the cable. Thus, when a wire is put in use without the precautions which, in gutta percha, is of a porous nature, and gradually becomes saturated with the sea-water, this occasioning great leakage of electricity, even in short cables, and still more in long ones.

To avoid the defects of gutta percha, which it has been proposed to employ India rubber, which is a better insulator, and is not porous; but India rubber is not plastic, and cannot therefore be applied by the cylinder and piston employed for gutta percha. Various other means have, however, been tried for incasing the wire in a continuous India rubber covering. Thus, a strip of India rubber has been wound on the wire in a spiral or helical direction, and with the edges of

each convolution in close contact with or overlapping the last convolution. The wire so covered has then been boiled in water for some time, by which the India rubber is sufficiently softened to cause the adjoining convolutions to adhere together; but this softening of the India rubber is said to injure its properties.

Several other modes of obviating the difficulties thus presented to the use of India rubber for submarine purposes, are being practically tested; but the plan which at present appears likely to supersede all others is that of Mr. C. W. Siemens, which preserves the India rubber in its natural state, and unites it in the simplest possible manner. If we cut two pieces of India rubber with clean scissors, and open the freshly-cut surfaces, they will be found to adhere so closely that they adhere firmly together. Mr. Siemens passes the wire, with two strips of India rubber, between two grooved rollers provided with cutting edges, or with other cutting rollers. The edges of the two strips of India rubber are thus cut, and the freshly-cut surfaces immediately pressed together with great force, thus uniting the two strips in a tubular covering to the wire. The wire is covered successively with two, three, or more similar tubular canings; and as an additional precaution, the machines are so placed that the seams of each covering may be at right angles to, or may break joint with the adjoining ones. We have thus an India rubber-covered wire, which is very perfectly insulated, but which still requires some addition, to protect it, and add to its strength. The ordinary iron or steel wire sheathing is rejected, as it is very heavy, and rapidly corrodes under sea water. Instead of the wires a number of hempen yarns, previously saturated with resinous cement, and all in an equal state of tension, are applied to the insulated wire with a slight twist. The cement is softened by heat as the yarns are laid on, so as to unite them all together. If necessary, another layer of cemented yarn is applied over the first, with the twist in the opposite direction to the first layer, and the whole is bound together with a thin copper wire or wires wound closely round it, and bedded in the softened cement, so that none of the parts can shift out of their places.

A light cable is thus produced, of which the chief strength is the hempen yarns, and the conducting wires, and which can be overhauled with a heavy iron sheathing, scarcely capable of bearing its own weight and the jerks to which a cable is necessarily exposed in the process of depositing it at the bottom of the ocean.

We need scarcely say that we shall hail with delight any improvements which are likely to place us again in instantaneous communication with the American continent, and to establish a permanent communication with our Indian empire and Australia.

NECROLOGY OF EMINENT PERSONS.

SIR FRANCIS BLAKE, BART.

Sir Francis Blake, of Twist Castle, county Durham, and Tilmouth Park and Fowberry Tower, county Northumberland, Esq., died at Hoxton Middlesex; succeeded his father, Sir Francis, 2nd Bart., May 22nd, 1818; married Jane, daughter of Mr. William Neale, who died April 3rd, 1827, was M.P. for Berwick-upon-Tweed from 1838 to 1841. The great grandfather of Sir Francis, Robert Blake, Esq., of Inch, married Sarah, fifth daughter and co-heiress of Sir Francis Blake, of Ford Castle, county Northumberland, Kant, a vedona adherent of King William the Third, and their son, Francis, who energetically supported Government during the Rebellion of 1745, and was created a Baronet in 1774; took in 1778 the arms of his mother's family, the Blakes of Rosmevishire, of which the celebrated parliamentary Admiral, Robert Blake, was a member. Sir Francis, third and last Baronet, expired at Twist Castle on the 3rd inst.

SIR GEORGE SIMPSON,

Late Governor of the Hudson's Bay Territory in North America, who died on the 7th inst., at his residence in Lachine, near the rapids of that name, on the River St. Lawrence and about nine miles from the city of Montreal, was the only son of George Simpson, Esq., of Leobridge, in the county of Ross. He was born in 1795, and married, in 1827, a daughter of the late G. M. Simpson, Esq. He passed nearly his whole life in the service of the Hudson's Bay Company, by whom he was highly trusted and respected; and received the honour of knighthood for his services to geographical science in the far north-west of the American continent; and was author of a work on Arctic discovery.

THE MARCHIONESS OF DONEGAL.

On the 14th inst. at Paris, the most honorable Harriet Anne, Marchioness of Donegal, eldest daughter of Richard, 1st Earl of Glengall; born, January 1st, 1799; married, December 8th, 1822, George Hamilton Chichester, Earl of Belfast, who succeeded his father George Augustus, 2nd Marquis of Donegal, October 6th, 1844, and by whom she had issue, Lord Chichester, born May 21st, 1826; died June 18th, 1837; Frederick Richard, Earl of Belfast, born November 25th, 1827; and unmarried at Naples, February 11th, 1853; and three other sons, Lord Ashley, son and heir of the Earl of Shaftesbury.

MR. JOSEPH LOCKE, M.P.

Mr. Joseph Locke, M.P. for Hoxton, died, on Tuesday morning, Mr. Locke was born in 1805, at a village near Sheffield, and educated at Barnsley Grammar School. In early life he was employed under George Stephenson. He afterwards attained well-deserved distinction for his engineering talent, which, though he did not achieve the celebrity of his friend, was of the same order. He was lately lost to us, as of a high order. Mr. Locke was President of the Institution of Civil Engineers, a member of the Royal Society, and a director of the Great Western, Great Northern, and Great Eastern Railways. Under his direction the Great Northern Railway was constructed, and he received the thanks of the House in recognition of his services in the construction of a French railway. He was likewise engineer of the Grand Junction Railway, and various other public works. His political principles were decidedly Liberal. He was returned a member for Hoxton in 1847. It is seldom we have to record the death of one who, as Mr. Locke, Stephenson, and Locke, within the brief period of twelve months.

WILLS AND BEQUESTS.

Thomas Cotterill, Esq., of Birmingham and London, "a millionaire," died, at the age of 81, on the 12th of August last. The property, with a very slight exception, is all of a personal character, and with money to the value of a quarter of a million invested in foreign securities, added to the amount in this country, which was sworn to be being worth £1,200,000, he left a large estate. The executors are **William Schofield, Esq.**, the nephew, **M.P.** for Birmingham; **Thomas S. Girdler, Esq.**, Notary Public, London; **Daniel Bell, jun., Esq.**, American Stockbroker, London; and **William Cotterill, Esq.**, the son of the testator. The will bears date the 11th of April, 1859, and has three executors, and five of them were made within two months of his death. Probate was granted by the London Court on the 12th of September. Mr. Cotterill has bequeathed to his son £100,000, to his daughter £35,000,—which legacies are independently of any form of real estate; to his sister, **Mrs. Ann Redfern**, widow, he has left his dwelling-house and furniture at Birmingham, and he has amply provided for her by will and otherwise; to his niece, **Ellen Redfern**, he leaves an annuity of £200 for her life; and to his grandniece, **Fanny Louisa Redfern**, a legacy of £5,000. The residue of his property is to be divided into twelve equal parts, among eight nephews and four nieces, the **Redforns** and **Schofields**, giving to each one respectively an equal share. On each of his executors he has bestowed an annuity of £400 for the term of five years as a remuneration for their trouble in administering to his affairs; he has made an exception in favour of two of them by a further legacy of £2,000 to Mr. Girdler, and £600 to Mr. Bell, jun. There is a legacy of £1,000 to Mr. Bell, sen., and there are many other legacies to personal friends, and also charitable bequests: the latter are confined to the town of Birmingham, and are as follows:—The General Hospital, £1,000; Dispensary, £1,000; Deaf and Dumb Asylum, £1,000; Blind Asylum, £500; and the Blue-Coat School, £500. There is one other bequest, also, of a public nature, being the sum of £5,300 given to the Chancellor of the Exchequer, towards the extinction of the National Debt. **W. Schofield**, **T. S. Girdler**, and **D. Bell**, are the acting trustees.

Fredrick Augustus Carrington, Esq., Recorder of Wokingham, of Oghborne, St. George, near Marlborough, Wilts, and of 28, Lincoln's Inn Fields, barrister-at-law, died on the 18th of July last, at the age of 67, and was a native of Lincoln, connected, and of an ancient family in Cheshire, was of the legal profession, and was called to the bar by that society. He subsequently obtained the Readership of Wokingham, was appointed recorder of Wokingham, and was afterwards made a Justice of the Peace. He has died possessed of very considerable property, both real and personal; the latter is sworn under 14,000. The will, with three codicils, was executed last year, and the whole of the documents are entirely in his own handwriting. He has bequeathed to **Stephen Banning**, Esq., who is well known, and has bequeathed to **John Stephen Banning** his real estates at Oghborne, St. George, Burslem, Avebury, Milton, and Pewsey, all in Wilts, together with certain leasehold property, and also his residence and furniture at Oghborne. He leaves to the family of **Saunders**, the late **John Saunders**, who is well known, in the same county. The crops now standing on these estates he directs to be sold, and the proceeds divided amongst certain relatives of his wife. He bequeaths to his sister, **Mrs. Marklove**, his funded property, family plate, and the furniture in his residence, **Lincoln's Inn**, and the residue of his personal property. He has left some small sums of relativity amongst those there are two words, who he has given to **Stephen Thomas Dunning**, the son of his executor, one being the sword of the legatee's ancestor, **John Banning, M.A.** of Oxford; and the other, which appears to be a singular instance, in **Wokingham**, he has bequeathed to the civil wars. To the **Hon. Society of Lincoln's Inn** he leaves certain volumes of bound MSS., and also a portrait of **Admiral Russell**.

Colonel Arthur John Reynell-Pack, C.B., of Aivford, Sussex, and 41, Harley street, London, died at Cork, in Ireland, on the 17th of August last, aged 48. The Colonel made his will on the 23rd of January, 1855, which was proved in London, on the 15th of September, by his brother, **Captain Denis William Pack-Bereford**, one of the executors,—the personally sworn under £50,000. The Colonel inherited very considerable landed property under the will of his mother, the late **Right Hon. Lady Elizabeth Louisa Reynell**, which was the daughter of the first **Marquis of Waterford**, and was the relict of **Lieut.-General Sir Thomas Reynell, Bart., K.C.B.**, her second husband. This landed property consists of estates in the counties of Somerset and Devon; added to which there are estates of his own acquiring, situate in England, Wales, Ireland, and other parts. The estates which he inherited under his mother's will the Colonel had the power of charging with an annuity of £400 to his wife. This annuity she enjoys, with a life-interest in the ever-increasing value of her own estates, both real and personal. On the decease of his relict, his estates, with the personality, are left to his daughters, the testator dying without male issue. Colonel Pack is highly connected, and of ancient descent, his family having settled in Ireland during the Commonwealth. His father, **John Reynell, Esq.**, died in 1760, and was a Colonel in the army. His father-in-law, **Lieut.-General Sir Thomas Reynell, K.C.B.**, was promoted at the siege of Sebastopol, for which he received the distinction of Knight of the Legion of Honour, and of the Turkish Order of the Medjidie; he subsequently became Lieutenant-Colonel of that gallant regiment; he was appointed Deputy Assistant Adjutant-General at the Horse Guards, and ultimately Assistant-Quartermaster-General at Cork, and was also a magistrate for the county of Sussex.

Richard Weekes Vincent, Esq., late of Corfoid, Sussex, died possessed of considerable real as well as personal property, the latter being estimated at £5,000. He made his will on the 18th of August, 1858, appointing three executors, one of them being of the Society of Friends. His real estates, residence, and furniture, together with the residue of his personal property, he bequeathed to **Samuel Vincent**, son of **Samuel Vincent**, of the Galvanizer Iron Works, Moorgate-street, the whole of this property to be vested in him on his attaining the age of twenty-five years; but in the event of his decease prior thereto, then to the next son of the said Samuel Vincent, or if him, then to the eldest daughter. The name of Vincent to be used or acquired by royal licence. There is a liberal bequest to the said **Samuel Vincent**, the father, as well as legacies to the testator's nephews, nieces, and personal friends.

The Late Duchess of Cleveland, wife of **The Most Noble Henry Duke and Marquis of Cleveland, K.G.**, and daughter of the fourth Earl of Foxley, having died intestate, the property which belonged to her Grace was administered to by the Duke, her husband, in the usual form. It appears some internal elapsed before this occurrence, the Duchess having died in the early part of last year. Letters of administration to her effects were only taken out by his lordship in Her Majesty's Court of Probate, in London, during the last month.

Reviews of Books.

THE SPORTSMAN IN THE HIMALAYA.*

Two different opinions that are sometimes found to exist between competent observers of the same object, taken under different points of view, are not the least instructive hints we glean from books that treat of nature and natural history in popular forms. Mr. Dunslop's little volume affords several examples of this, the most remarkable of which is the discredit he throws upon the generally-accepted reputation of the elephant for docility and gentleness. His view of the character of that indomitable servile and companion of the Eastern household, is very nearly directly opposed to the evidence of Sir Emerson Tennent. But, apart from the larger experience which justifies him in holding the adverse view, he gives a sufficient reason for it in the circumstances under which Sir Emerson witnessed the elephant-catching in the Ceylon corals, which he so graphically describes. It is certainly one thing to be seated on a comfortable platform, perfectly secure from danger, to witness a process of snaring elephants, conducted upon what may be called scientific principles, by an overwhelming array of power and appliances; and another thing to encounter the wild elephant face to face in the jungle, with nothing to depend upon for protection but personal resources, promptitude, and skill. Why the elephant is not so frolicsome and defiant in the one case as in the other may be easily accounted for; and the "calm and dignified demeanour" he exhibits when he is surrounded by a circle of flames, and stoned by the shouts and clamour of some thousands of natives, may in reality represent his fear or his desire to escape from the snare, and into timidity and innocence. Both pictures are true; but they are true under opposite conditions. The amiable character of the elephant, under favourable influences, is not compromised by his savagery in forests and water-courses; neither is it to be too much taken upon trust at any time. Sagacity and a patient and suspicious character are necessary to enable us to look upon him with respect from elephants that consistency of conduct which we seldom find in the wisest and most considerate men. Provocation, neglect, temptation, which exert such strong moving influence over the actions of human beings, have their effect upon elephants also; and if the domesticated animal sometimes betrays a remembrance of its aboriginal passions, we may be tolerably sure, could we only find it out, that there is some other cause for it than the mere viciousness or cruelty of its nature.

Not the least curious circumstance in the history of the elephant on its passage alive from its entangled lairs into the hands of man, is the part which the tame female plays in the treacherous proceeding. We have seen, in Sir Emerson Tennent's work on Ceylon, how the elephants are entrapped in the corals by the Dalaias of their kind. Mr. Dunslop tells us how the tame females are employed in getting the elephants out of the pits which are made for them on their accustomed tracks. These pits are fifteen or twenty feet deep, and are dug transversely across the pathway, and carefully covered with branches and grass. The elephant is so wary, however, in testing the ground as he advances, that he seldom falls into one of them; but when he does, the difficulty is to get him out. This result is rarely accomplished without the aid of a tame elephant, who acts as nurse or trainer, and in for that purpose, coupled with the tame elephant, who acts as nurse or trainer, the tame elephant cannot be used, the snared elephant is half-starved, by way of subjugating him, before he is let out of the pit. But that is only in the case of comparatively young ones. A full-grown male is hardly amenable to training, and is considered so dangerous that he is sometimes destroyed.

Tiger-hunting seems to be even more exciting than elephant-hunting, partly from the marvellous power of the animal, and partly from its subtlety and stealthy mode of approach. Its strength is tremendous. A single blow from the paw of a tiger will crush the bones of a bellock; it will then carry off the body with the utmost ease in its mouth, just as a cat carries off a mouse. Mr. Dunslop considers a Bengal tiger to be a more dangerous enemy to meet on foot than an African lion. It never roars; its usage is to pounce amongst its own kind; and when it is about to charge, the only signal it gives is a succession of low growls. The sportsman who attempts a tiger alone, and on foot, with the ordinary double rifle or gun, incurs a hazard from which his escape will be next to a miracle. The only source of safety, in this form, is a party of ten or a score of men who are posted far apart when beating through the tiger-grass or jungle, as the animal generally sneaks away from noise and numbers.

Every species of sport to be obtained in the Himalaya is touched upon, with more or less fulness, by Mr. Dunslop. The volume is enriched by numerous illustrations, and several anecdotes and anecdotes of interest, which will be useful to future sportsmen. An expedition to Tibet is one of the most attractive passages; and the whole account of the snowy ranges, and of the incidents of travel and adventure amongst them will be read with interest. The tourist who for the sake of a little money in the Indian hills, will find in these light sketches of the Indian hills scenes which may fairly challenge comparison with the loftiest peaks from Mont Blanc to Monte Rosa. One pass, that of the Chor Hiti, is 18,300 feet above the sea-level; that is, 2,600 feet higher than Mont Blanc. The passage is dangerous, and lives are frequently lost on the wild heights; yet, notwithstanding the warnings which the place in this way, the game is generally regarded as a highway for trade. The principal danger apparently arises from snow-storms and appalling snow-drifts, under which large parties of traders are sometimes buried. But upon the whole, with a careful observance of the state of the weather, the risk may be very considerably diminished.

Mr. Dunslop is a keen sportsman, and a close observer of the phenomena connected with his favourite pursuits. But his enthusiasm carries him a little too far when he expresses a hope that his narrative of his experiences may induce English sportsmen, instead of spending their time, money, and trouble, on deer-stalking and bird-shooting in Scotland, to undertake a voyage to India for the sake of a little money in the Indian hills. It is hardly likely that the Indian hills would altogether occupy fourteen months, and Mr. Dunslop is careful to indicate the articles with which it will be necessary for the sportsman to provide himself, the time when he should start, and the route he should take.

* Hunting in the Himalayas, with Notices of Customs and Countries from the Elephant Hunts of the Dehra Dooars, and the Bandouch Tribes in Bharat Soud. By R. H. W. Dunslop. London: R. Bentley.

We apprehend that our sportsmen will satisfy their curiosity with the perusal of the book; and, remembering that there are risks of other kinds in India besides elephants and tigers, be content to enjoy the luxury of hunting in the Himalayas by deputy.

COMMON INSECTS—THE HONEY-BEE.*

We are glad to find that not only Mr. Samuelson's pleasant account of the worm and the fly reached a second edition, but that it is followed by another little volume on the honey-bee.

Notwithstanding the numerous and elaborate works that have been published in all the principal European languages, on the bee and its habits, there still remains a wide and unexplored field for inquiry, which is only recently laid open to naturalists by the modern microscope. This instrument, thanks to the combined optical and mechanical skill of the best makers, is now as different and superior to the microscope of thirty years ago as the telescope of Lord Rosse to that used by Newton. The works before us are examples of the way in which minute observation, with a good instrument, lead to important and interesting discoveries in the structure and habits of common animals.

An established community of bees comprises one perfectly developed female or queen, the mother of the hive; about 600 or 800 males, called *drones*, of whose real use and habits singularly little is even now known; and from 15,000 to 20,000 imperfectly developed females, which they accumulate the stores of food for winter use, are called *workers*. The females, both queen and workers, are provided with stings, which also serve as ovipositors; but the males have no weapons of offence. The queen bee, or perfectly developed female, and the males or drones are much larger than the workers.

The productions of the hive are well known to consist chiefly of honey and wax. They include also what is called *bee-bread*, composed of the pollen of flowers moistened with honey, and serving as food for the young; and *propolis*, a resinous substance often seen in the comb and much used in the construction of the hive. This *propolis* is also employed to enclose and render harmless any animal that enters the hive, and is there destroyed or dislodged, but is too large to be removed. A curious anecdote is told of a snail that had crept into a hive in search of forbidden sweets having been solaced down by this material, "so fixing him as a stinging joke, a laughing-stock, a living anatomy, like Marston's Constance, 'alive within the tomb' [for a snail, though excluded from the air, would not die], so that he who had heretofore carried his own house was now made his own monument."

An original swarm of bees separating from a hive, consists of the queen of the original hive (who, after hatching another queen, is obliged to leave) accompanied by about 1,000 drones, and about ten times that number of working bees. If received into an empty hive, the queen at once lays eggs, and the workers construct the comb, collect honey, feed the young, and perform the other labours of the hive.

"First of all, a number of wax-makers having assembled for the purpose, one of them draws from the wax-pockets or belts, situated between the rings of her abdomen, where the wax is secreted, a certain quantity of this material, which she moistens with a fluid from her mouth, and then models here the form of a thin narrow ribbon, by repeated workings with her feet, jaws, and delicate tongue. The particles of wax thus obtained she attaches to the stalk of the hive, and then proceeds at once to fabricate and apply a second, and third, and so on, until her wax is exhausted, and so on, when she makes way for a second labourer."

The comb is completed by the *nurse-bee*, "who excavate the cells on both sides of the wall, drawing out the wax in the required direction, so that one partition serves as the base of ten cells."—"Honey-Bee," pp. 74, 80.

Three kinds of cells are constructed for the eggs laid by the queen, and she deposits first worker-eggs in worker-cells, then drone-eggs in drone-cells, and finally one or more eggs in the royal cells, whence proceed the future queens. And now comes a very extraordinary fact related by Mr. Samuelson, as the result of the minute and conscientious observation of some German naturalists, namely, that the fertilisation of the eggs is effected at the will or instinct of the female as they are deposited, and that the *drones* are the *progeny of eggs not fertilised*.

The time occupied from the deposition of the egg to the final appearance of the insect is, for the queen sixteen days, for the worker about twenty, and for the drone twenty-four days, and it is well known that, in the event of any accident happening to the queen, the nurse bee has been enabled by a peculiar management of the food to develop one of the workers into a queen.

In considering the peculiarities of structure of the bee, we cannot but regard the eye and the antennae as among the most striking and instructive. The bee has different kinds of eyes, no doubt adapted to different circumstances and conditions in which it exists, enabling it to discern objects at a distance the flowers that yield it its food and its distant home, while the others enable it to execute its wonderful mechanical instincts in the gloom of the hive. There are three detached simple eyes, and two groups, each of which consists of nearly 4,000 optical instruments pointing to one minute speck of nervous matter. Examined by the microscope, every one of these instruments is found to be a six-sided pyramid, whose base is a six-sided lens, the lower separated from six similar adjacent pyramids by a dark pigment. The lens is double, each part being flat on one side and convex on the other, and the two flat faces are in contact, but the density of the two is different, a peculiarity lately adapted to the microscope, by the best instrument-makers. It is an important fact that "in the drone, which rarely quits the hive, except to swarm or accompany the queen in her wedding flight, these eyes are much larger and more numerous than either in the queen or worker," and we cannot but hope and believe, for the credit of the male sex, that some positive and important point in which good eyesight is needed, may some day be discovered for this part of the bee community.

The mode of intercommunication of animals is a subject of great interest,

and where the instincts are so high and the habits so curious as in the bee, this subject is especially important. We cannot but consider that naturalists have been too anxious to discover some special organs of hearing, smell, and touch, corresponding to our ear, nostril, tongue, or fingertips. We can see no reason why means altogether distinct from those we are familiar with should not have been adopted in certain animals; and in the bee, taste, smell, touch, &c., the antennae, which certainly show no external resemblance to them, would seem to replace several of our senses.

"Whilst its antennae remain unimpaired (says Mr. Samuelson) the instincts of the bee are wonderfully active and acute, but as soon as it is deprived of these mysterious organs, its whole nature seems to undergo a change, and its physical or mental state may then be compared to that of an imbecile or insane person, to one, in fact, who has lost his senses."—"Honey-Bee," p. 32.

The mouth of the bee presents a wonderful combination of contrivances, containing a pair of toothed pincers, extremely strong and solid, two long pointed blades, forming a pair of shears, and a tongue fenced in with a pair of subsidiary feelers. Through the tongue runs a tube terminating at the tip by a small flat expansion closing the tube at the will of the animal. The use of this mouth apparatus is as varied and important as its structure indicates.

The sting of the bee is a double barbed dart, each piercer being furnished on one side with eight teeth, and the two stings, which are contained in a hollow sheath, diverge, as they enter the flesh, and a drop of poison at the same moment is expelled into the open puncture. The sting and apparatuses are often left in the wound, in which case the best mode of extraction is "by pressing the open end of the barrel of a key upon the puncture; this forces out both sting and poison, and affords instantaneous relief."

While fully appreciating their wonderful instinct, Mr. Samuelson does not attribute to the humble animals he describes any amount of true reason. He contends that the highest mental powers of the bee-work are true instincts not improvable or communicable by education, while the vertebrate are capable of reason, intelligence, and understanding, nobler qualities being superadded in each succeeding stage of progress. Taking the optimist view of natural history, and endeavouring to find in every instinct and habit a direct relation to human requirements and conclusions, we could scarcely write a brief summary of some of the uses of the insects he describes, and, without altogether falling in with his conclusions, we quote them as pleasing and illustrative.

"The slowly worn accumulated, and still continues to construct, the surface soil to which, each spring, we consider the seeds that yield us rich autumnal fruits."

"The fly, meanwhile, is the guardian of our health, and whilst we, ungrateful, rob the parent of existence, her countless progeny protects us from the dire disease that menaces our life."

"And then, the sensitive, industrious little bee flies busily from flower to flower, and fertilising blossoms in her flight, makes gay our gardens, lawns, and meadows, and gathering honey as she goes, with this and with her wax supplies the means to gratify our cultivated tastes of mind and body."—"Honey-Bee," pp. 164, 165.

MODERN PAINTERS.*

THE preface to this, the concluding volume of a work which has extended itself over a considerable period, contains the key to a treatise which has had a developing life slowly and by degrees. From a little beginning, a new germ of ideas as it were, it has gradually grown to completeness; and now at last we have presented to us the deliberately matured fruit of the experience of years. We must not, then, be surprised, if, in this fifth volume, we see much change and modification. To resume our earlier notice, the botanical metaphor, we must not complain if the thought-trees have developed themselves in a different way from what we should have expected, or even brought forth other fruit than that for which we should have looked.

The conditions of tree-life are change and not permanence. This will explain the change in the volume before us, but the author bids us remember that,

"In the main aim and principle of the book, there is no variation from its first article to its last. It declares the perfectness and eternal beauty of the work of God; and tests all work of man by concurrence with, or subjection to, that."

In short, Mr. Ruskin's purpose throughout is to prove, that he who will rule must first obey. Now this principle is by no means a new one. Bacon showed how that man was "nature's minister;" and that, though born to be the king and lord of the universe, he can only gain the mastery over nature by becoming its obeying minister. We have seen it done once for all in philosophy. Turner brought out for landscape painting. As the philosopher, by careful investigation of the operations of nature, was enabled to deduce principles which are true for all time; so the landscape-painter, by assiduously watching the aspects of nature, has traced for us on canvas and on paper, principles which are eternally and immutably true for landscape-painting, and, indeed for all Art. Turner's application to the study of nature was something almost incredible. We are told in the preface to this volume, that Mr. Ruskin, in 1857, arranged *nearly thousand* of his sketches from nature! And this patient study at length reaped its own reward, so that, be it from the humblest servant, sitting, as it were, at the feet of nature, and drinking in every lesson that fell from her lips, became the very prince and king of landscape painters. But the road to his success is open to those who will imitate Turner's perseverance and faithfulness.

In his fourth volume our author showed his readers the necessity for those who would be good painters of mountain-scenery to give good heed to the beautiful sermon that lay in stone. And now, in the volume before us, he bids all those who will draw trees first to learn something about them.

Of course a number of persons, who are too lazy to study anything, will make a great outcry of the uselessness of botany to a painter. This objection is perfectly true to a certain extent. Botany is as useful, and no further, to a painter of trees, as anatomy is to a painter of animals. All would explain

* The *Honey-Bee*: its Natural History, Habits, Anatomy, and Microscopic Structure. With Illustrations. By James S. Samuelson, J. B. Reardon, F.R.S., M.D. Lond., F.L.S., &c. Also Two Chapters on Insects and Bees: being an Introduction to the Study of Comparative Zoology. By James S. Samuelson, J. B. Reardon, F.R.S., M.D. Lond., F.L.S., &c. The *Earth Worm* and the *Common House Fly*. In Eight Letters. By James Samuelson, assisted by J. B. Reardon, F.R.S., M.D. Lond., F.L.S., &c. With Microscopic Illustrations by the author. Second edition.

* *Modern Painters*, Vol. V. By John Ruskin, M.A. London: Smith, Elder, & Co. 1860.

times in which they lived, or in the apprehension that ever overshadowed their consciences as to that just and awful retribution that awaited themselves, should fortune forsake the cause in which they had embarked. To a faithful follower, to a noble maiden who gave him her purest love, to a child who had not, and could not have offended him, Captain Brant the Pirate, is described as conducting himself with the same cruelty as if they were his worst foes. Now, this is not true to nature. It is not correct as regards the worst characters, for, with the very worst, even amongst the buccanniers of America, there was, as it is justly observed by Southey in his "History of Maritime and Inland Discovery," a society established, entitled "The Brethren of the Coast," and they too had "a code of morality," and it was "such as might be expected amongst men who, while they renounced a friendly intercourse with the rest of mankind, depended upon each other's fidelity."

No such personage as Captain Brant is described could ever have existed anywhere but within the walls of a lunatic asylum, in the pages of a romance, or upon the boards of a transatlantic theatre, in which last place it is probable our author's hero will, before many months have passed away, be making his bow to a well-pleased but not very discerning audience.

We must admit, notwithstanding our objections to "Captain Brant the Pirate," that Lieut. Wise's story about him will, most probably, because a very popular book. It is crowded with stirring incidents, terrific combats, awful descriptions, a frightful love story, elaborated accounts of torturing punishments, and agonising deaths. Those who have a taste for horrors will gloat over the pages which Lieut. Wise has penned for them. Such readers abound in this country: we deplore their taste, but, as we cannot amend it, we may assure them that in "Captain Brant" they have the opportunity of making an acquaintance with the greatest scoundrel that can possibly be encountered in the whole range of Negvate literature.

Before parting from this book it is necessary to notice the superabundance of very strange rhymes with which it is overlaid. All these rhymes are marked with inverted commas, as if they were quotations from works previously published. It may be said that in the case, they are curious specimens of Lieut. Wise's taste in selection; but if they are his own composition, then we are not surprised that his diffidence in his powers as a poet should have sought for shelter under the form of an anonymous contribution.

The two following extracts will be sufficient to demonstrate the peculiarity either of Lieut. Wise's taste for poetry, or of his original talent as a maker of verses:—

"Skeleton hands that will never be fatter,
All the domestic duties that I have to do,
Showering for food to eat and latter,
Bones to shatter
And limbs to scatter;
And who it is that must furnish the latter,
Those blue-blackening men know well."
Chap. xiii., p. 141.

"When descending on the Atlantic
The gigantic
Storm wind of the Equator,
Lashed by his own wrath he scourges,
The telling surges,
Laden with treasure from the rocks."
Chap. xiv., p. 209.

THE POOL OF ST. FILLANS.

[THE POOL OF ST. FILLANS, in the Highlands of Perthshire, was celebrated in early ages as a place for resort for the cure of idiocy or insanity. Immersion in its healing waters—accompanied by adequate offerings to the shrine of the saint—was believed to work a cure in the most desperate cases.]

Foe thirty long years on the side of the mountain I've guarded
Thy pool, oh! St. Fillan!—last hope of a doleful heart;
For thirty sad years I have sat as thy spring unwarded;
False Saint! and false Fathin! I'll take up my cross and depart.
Hither come young and fair,
Hither comes hoary hair,
Hither comes Hope with a light in her fast-fading eyes;
Hither comes humbled Wealth,
Begging the crumbs of Health,
Which Fate, like proud Lazarus, sits 'mid the stars and denies.

Oh, cheating St. Fillan! I brought thee my boy in his childhood,
And now he's a man, and his hair is bespattered with gray;
What hast thou done for him? Ruins he not yet in the wild-wood
Dark—in the Night of Unreason—unconscious of Day?
Have I not watched and wept,
When o'er his features crept,
Sparkles of light evanescent as gleams on the wave?
Or, as in waters cast
Shadow of bird that passed,
Or glow of the far-fishing steel in the grasp of the brave?

Idle! all idle! and Fountains, I've lost my reliance!
Thou cannot endow him with soul that he never enjoyed;
Selfish and proud I may be, setting God at defiance,
In craving the boon for my child which His wisdom destroyed.
Happy and thoughtless he,
All the grief lies with me!
Let me endure it, and cease to lament and deplore;
'Tis but a soul asleep
In the earth-primed deep,—
Heaven shall awake it, in Freedom and Light evermore.

LIST OF NEW BOOKS AND NEW EDITIONS.

PARIS SEPTEMBER 1860. LONDON SEPTEMBER 1860.

A Handbook for Bards, Bucks, and Oxford-shire. Post 8vo. cloth. 7s. 6d. Murray.
Private and Confidential Selections for the Island and Bazaar. By O. Windsor. Imp. 8vo. 10s. 6d.
Gull's (W.) Memoirs. 2nd thousand, post 8vo. sewed. 1s. 6d.
Gull's (W.) Memoirs and Revival. 12mo. 2s. 6d. Trindler.
Minnipiegan and a Purgatory: a Book for Boys. Fcap. 8vo. imp. 1s. Low & Co.
The Prairie and Overland Traveller. By Capt. R. B. Marcy. Fcap. 8vo. cloth. 1s. 6d.
Davis's Suggestive India. 12mo. Eighth edition. 1s. 6d.
W. Macpherson's Fraction of the Fifth Council. Royal 12mo. 1s. 6d.
Memoirs of the late Sir John Harrison, of Weston, by Rev. T. Bent. 8vo. 12mo. cloth. 1s. 6d. Wordsworth & Co.
Stories of the Crusaders. By the Rev. J. M. V. Nale. Second edition, 16mo. cloth. 1s. 6d.
Masters.
Pay Today! Trust To-morrow. 12mo. sewed. 1s. 6d.
Working and Waiting: a Tale. 12mo. cloth. 1s. 6d. Masters.
The Three Books of Theophrastus to Antipater. By the Rev. W. B. Flowers. cloth. 2s. 6d. Masters.
The Life of the Blessed Virgin. By A. St. John. New York. 12mo. 1s. 6d.

Shipwrecked, &c. at Sea. 12mo. 5s. Hamilton, Bardsell, or the Triumph of Mercy. 12mo. 5s. Hamilton.
British Settlements in India. 12mo. 4s. 6d. Hamilton.
R. Brown's Elements of Natural Science. 4to. 41. 11s. Hamilton.
Frederick's Campaigns, &c. 12mo. 4s. 6d. Hamilton.
Winkler's (O.) Hidden Life. Eighth edition. 12mo. cloth. 2s. 6d. J. F. Shaw.
Lange's School. 2nd ed. 12mo. 1s. 6d. Mosley.
Oleum & Greek and English Lexicon. 8vo. 12s. Mosley.
Rural and Domestic Tables. 4to. 41. 1s. Mosley.
Haskins's (T. R.) Poems. Fifth edition. 12mo. cloth. 7s. 6d. Hatchard.
Macpherson's (C. E.) Practice of Latin Composition. 12mo. cloth. 1s. 6d. Hatchard.
Buntings for All Seasons. 8s. 6d. Haddon.
Village Life. 12mo. 1s. 6d. Hatchard.
Kenny's (W.) Elementary Manual of Latin. Privately. Post 8vo. 1s. 6d. Hatchard.
Old Journeys in and out of London. By Hollinghead. Post 8vo. cloth. 7s. 6d. Greenbridge.
Hardships made Easy. Crown 8vo. cloth. 1s. 6d. Greenbridge.
Travels not Far from Home. By A. St. John. 12mo. 1s. 6d. Greenbridge.

LITERARY INTELLIGENCE.

MR. JAMES BLACKWOOD will publish a new work from the original Russian, entitled "Cossack Tales," by Nicholas G. L. de la Motte, and a novel by Mrs. Gordon Smythies; and "New Readings of Homer," by W. W. Orlé.
Messrs. Sampson Low & Co. announce "The Prairie and Overland Traveller," by Captain R. B. Marcy; and "A Handy Book of Patent and Copyright Law," English and Foreign," by James Fraser.
Messrs. Macmillan & Co.'s new list includes "A Life of Edward Forbes, the Naturalist," by George Wilson; "An Introduction to the Study and Use of the Psalm," by the Rev. J. F. Thurgood; and a new work "On the Origin and Succession of Life on the Earth," by John Phillips.
Mr. Peter Cunningham has just finished his new work, entitled "Father and Son," which will be produced by Messrs. Chapman & Hall immediately.
Mr. J. C. Jefferson, author of "Creole Rice," is about to issue a new work, published by Messrs. Longman, being the Life of Stephenson, the celebrated engineer.

Messrs. Greenbridge will publish on the 1st of October, "A History of the Fishes of the British Isles,"—Part I., by Jonathan Couch.
Among Messrs. Hogg & Co.'s list are now several new works: "The Wits and Bards of Society," by Grace and Philip Wharton, authors of "The Queens of Society"; "Men who were Earnest"—a series of Biographical Studies; a new juvenile work by Mary Howitt, entitled "A Treasury of Tales for Young People"; and "The Busy Hours Around Us: a variety of Trips and Visits to the Mine, the Workshop, and the Factory."

Messrs. Longman have nearly ready a new work, called "The Dead Shot, or Sportsman's complete Guide."

The third edition of "The Woman in White" will be published during the next week.

M. Eugène Batin has just published, in Paris, a fifth volume of his elaborate "History of the Press in France," embracing the exact period of the great French Revolution.

The Librarian-Napoleonienne has issued a Pamphlet, by Pierre Dupont, entitled "Certain Rules of a Coalition."

A Haytian Primer has just made its appearance at Port-au-Prince.

M. Deuter, the famous pamphlet publisher of the Palais Royal, has just issued another brochure on the Isthmus of Suez, in which the policy of England and Russia is discussed.

"The Speeches and Proclamations of Napoleon the Third" have been collected into a volume.

The first part of "A Biographical and Political History of the Legion of Honour" has appeared. It is to be an extensive work, to which, according to the publishers, a band of French and foreign authors will contribute.

The Rev. James Whitte, the well-known author of some valuable historical works, has now in the press a "History of England," to be completed in one volume, uniform with the same author's "History of France."

ADVERTISEMENTS.

MR. WASHINGTON FRIEND'S grand musical and pictorial entertainment, called TWO HOURS IN CANADA and the UNITED STATES. Illustrated by his great moving panorama, delineating 8,000 miles of the most interesting scenery, comprising the Falls of Niagara and the River of the St. Lawrence, the Victoria Bridge, Canada, America, Indian, Emigrant, and Negro Life, &c. Mr. Friend will also relate characteristic anecdotes and adventures, and sing original songs and melodies of the country, accompanying himself upon seven different instruments.—(OPEN DAILY, at three and eight o'clock. Balls, 1s.; arena, 2s.; gallery, 1s.—St. James's Hall, Finsbury.)

ZOOLOGICAL GARDENS, Regent's Park.—SATURDAY HALF HOLIDAY.—The admission to these Gardens on Saturdays will be REDUCED TO SIXPENCE each person, during the months of AUGUST, SEPTEMBER, and OCTOBER.

MADAME TISSAUD'S HISTORICAL GALLERY, at the Bazaar, BAKER STREET.—Continuation of Early English Kings from the Conqueror. KING STEPHEN, grandson of the Conqueror, in the quiet costume of the period 1180. King recently slain Henry I. William Rufus, William the Conqueror and his Queen studied from old English manuscripts.—Admission, ONE SHILLING, EXTRA ROOM, SIXPENCE. Open from eleven till Ten at Night.

ROYAL CREMORNE GARDENS.—Admission, One Shilling.—DAILY, the highly interesting STEPHENSON, the only novelty in London. The world-famous Ferry, Canada, and Drying Wells. Grand Equivocal Performance in the Cirque Orientale, including the wonderful Lili Mousi and the classical performance of the "The Master of the Elements." Police, the Roman History. The Inconceivable. The Great. Various Vocal and Instrumental Concert. At Freeze Bath. Lustrous Illumination. Splendid Pyrotechnic Displays. Table d'Hôte Pepper at Six. Coffee and Private Room for large and small parties. On Sunday, Frome. Table d'Hôte at Six, 2s. 6d.

THE ATLANTIC AND GREAT WESTERN RAILWAY,

CONNECTING

NEW YORK AND ST. LOUIS,

BY THE JUNCTION OF THE NEW YORK AND ERIE, AND THE OHIO AND MISSISSIPPI RAILWAYS.

A CONTINUOUS SIX FEET GAUGE,

TWELVE HUNDRED MILES, WITHOUT CHANGE OF CARRIAGES.

ISSUE OF ONE MILLION DOLLARS FIRST MORTGAGE BONDS,

BEARING SEVEN PER CENT. INTEREST.

Payable Half-yearly, on 1st JANUARY and 1st JULY, at the BANK OF LONDON, Threadneedle-street, London; and at the Banking-house of Messrs. DUNCAN, SHERMAN, & CO., New York.

The Four Coupons first maturing will bear the Guarantee of the Bank of London, duly endorsed, thus guarding the investment against any possibility of default during the construction of the Lines in Pennsylvania and Ohio.

DIRECTORS.

WILLIAM REYNOLDS, Esq., Meadville, Pa., President.
HON. GAYLORD CHURCH, Meadville, Pa.
NATHANIEL MARSH, Esq., New York, Director and Receiver
New York and Erie Railway.
WILLIAM EVANS, Esq., London, Director New York and
Erie Railway.

MR. E. F. SATTERTHWAIT, London.
M. PHILIPP NICHOLAS SCHMIDT, Frankfurt.

CONTRACTORS.

WORTHY S. STREATOR, Esq.

ENGINEER-IN-CHIEF.

THOMAS W. KENNARD, Esq., C.E., Great George-street, Westminster.

EX. SENOR DON JOSE DE SALAMANCA.

TEMPORARY OFFICES—11, ST. HELEN'S-PLACE, BISHOPSGATE-STREET, LONDON.

THE ATLANTIC AND GREAT WESTERN RAILWAY—378 miles in length—is the middle link of a Grand National Line of 6-foot gauge, 1,300 miles in length, from New York through the great States of New York, Pennsylvania, Ohio, Indiana, and Illinois, to St. Louis; of which about 800 miles have been many years in operation. It possesses extraordinary facilities for construction, having no tunnels, no deep cuttings, few bridges, and no forries; availing the Alleghany Mountains on the South, and occupying the natural channel of trade between them and the Lakes on the North. It traverses some of the most fertile portions of New York, Pennsylvania, and the "Garden of Ohio." It passes through the large shire towns or centres of fourteen Counties in the State of Ohio, with more than one million of inhabitants, and a taxable property of 200,000,000 dollars, and accommodates seventeen cities and towns in New York and Pennsylvania, heretofore without railway facilities.

The differing laws of the States of New York, Pennsylvania, and Ohio, through which the line runs, render separate organizations necessary, though practically the whole is one line. The present issue is confined to the Bonds of "New York," that section being now finished; a considerable portion of the works in "Pennsylvania" is also finished, and the "Ohio" section is in a very forward state, and can be completed in 1861. As each of these sections is opened, the Bonds will be issued to the public, all the funds being provided in the mean time by calls on Stock and advances by the Contractors.

THE ATLANTIC AND GREAT WESTERN connects with the NEW YORK AND ERIE (of which it is a continuation) at "Salamanch," about 400 miles from New York; and the NEW YORK AND ERIE RAILWAY connects down "the connection to be of much importance, from the large and valuable traffic which it will concentrate and throw on their road, that they have undertaken to pay to the ATLANTIC AND GREAT WESTERN a bonus of 10 per cent. on the gross receipts from freight and passengers during five years from completion, and 5 per cent. for another term of five years thereafter." This Bonus is especially appropriated to securing the interest on Bonds.

The association of M. DE SALAMANCA with the ATLANTIC AND GREAT WESTERN RAILWAY is a voucher that the merits of the enterprise are not overstated, and an assurance that the whole line will be rapidly completed and its resources developed.

The Bonds are secured by a first registered mortgage, constituting a lien on the income and all corporate rights, privileges, lands, franchises, plant, and

property of the Railway; and give the holder the right of conversion into shares at par until 1st January, 1861.

The Bonds of the present issue are of 1,000 dollars each, redeemable at par in twenty years, are transferable without stamp or endorsement, with Interest Coupons attached, and will be paid on the 1st of JANUARY and 1st of JULY in each year, at the BANK OF LONDON, Threadneedle-street, London, and at the Banking-house of Messrs. DUNCAN, SHERMAN & CO., New York.

The Bonds will be issued at 80 per cent., or £180 sterling per Bond—to include the Coupon due 1st January, 1861, and will be ready for delivery on 1st November, 1860, or earlier, at the option of the purchaser.

The road represented by these Bonds is finished, its cost is known and liquidated, and its interest and dividends will be paid from its actual earnings.

The value of the security offered may be best appreciated by comparison with the four great lines of the same system.

The Total Income of these lines, for the last four years, has been as follows:—

| | ERIE. | PENNSYLVANIA. | BALTIMORE AND OHIO. | NEW YORK CENTRAL. |
|------|-----------|---------------|---------------------|-------------------|
| | Dollars. | Dollars. | Dollars. | Dollars. |
| 1856 | 6,130,050 | 4,720,193 | 4,385,551 | 7,774,169 |
| 1857 | 5,712,095 | 4,855,669 | 4,616,698 | 8,927,251 |
| 1858 | 5,151,616 | 5,185,330 | 3,855,485 | 6,528,412 |
| 1859 | 4,482,119 | 5,302,555 | 3,618,618 | 6,309,818 |

And these receipts, divided by the mileage obtaining traffic, give the following receipts per mile:—

| | ERIE. | PENNSYLVANIA. | BALTIMORE AND OHIO. | NEW YORK CENTRAL. |
|---------|----------|---------------|---------------------|-------------------|
| | Dollars. | Dollars. | Dollars. | Dollars. |
| 1856 | 11,237 | 12,722 | 11,572 | 12,818 |
| 1857 | 10,164 | 13,088 | 12,182 | 13,208 |
| 1858 | 9,117 | 13,076 | 10,175 | 10,780 |
| 1859 | 7,933 | 14,453 | 9,547 | 10,249 |
| Average | 9,612 | 13,550 | 10,809 | 11,788 |

The contract cost of the Atlantic and Great Western Railway is 37,000 dollars per mile, say £7,400 sterling. Hence, an average receipt per annum equivalent to that of those four great lines, will give an annual return upon the whole cost, Capital and Bonds, of 17-35 per cent., allowing 30 per cent. for working expenses.

Applications for Bonds must be made to the Brokers. Copies of the Prospectus, with Map, and the Reports of the Engineer-in-Chief, can be had from the Brokers, or at the Offices of the Company, No. 11, ST. HELEN'S PLACE, LONDON.

THE LONDON REVIEW

AND WEEKLY JOURNAL

Of Politics, Literature, Art, & Society.

CONDUCTED BY CHARLES MACKAY.

No. 14.]

SATURDAY, OCTOBER 6, 1860.

[PRICE 3d.]

THE NEW AUSTRO-RUSSIAN ALLIANCE.

THE projected meeting of the Emperors of Austria and Russia, at Warsaw, is pregnant with significance. It develops a new phase of Russian policy, but one for which those who have followed the subtle diplomacy of the vast Tower whose projects of territorial aggression are second to none in Europe may have been in some measure prepared. It would be a mistake to suppose that the apparent rapprochement between the two Governments indicates any change of sentiment in either of them. The Russian hostility to Austria, in consequence of old standing grievances, remains undiminished; while Austrian distrust of her powerful neighbour is still an active principle in the diplomacy of the Vienna Cabinet. It is impossible that Count Rechberg can be ignorant of a fact known to every Hungarian peasant, that Russia has her designs upon the eastern portion of the Austrian empire—that she has been diligently fostering the discontent which has prevailed in Hungary for some time past—that she has watched with growing satisfaction the signs of decrepitude which Austria has recently exhibited, and that she has come to a definite understanding upon the subject with his Imperial Majesty of France. As to what the terms of the arrangement may have been which was concluded between Count de Morny and Prince Gortschakoff at St. Petersburg, some months since, we can scarcely hazard a conjecture; how far the events which have occurred in Italy since that time may have modified them it is difficult for those who are not behind the scenes accurately to appreciate; but of the broad fact there can be little doubt that a thorough understanding has all along subsisted between France and Russia with reference to the main joints of European policy as bearing upon the three countries principally interested in the changes which the continent of Europe is now undergoing. Those countries it is scarcely necessary to say are Italy, Austria, and Turkey. Their destinies are connected by a chain, the links of which may occasionally require alteration, but which nevertheless binds them so firmly together that the fate of one must, more or less, directly affect the condition of the other two. Up to the present moment Russia has maintained an attitude of apparent indifference to the events which were transpiring in the Italian peninsula. She has been contented to prosecute with unceasing energy a secret agitation in parts of Austria and Turkey which should prepare those countries for the contingencies which must be forced upon them by the progress of events in Italy. It was, moreover, uncertain how those events would develop themselves; and Russia would not commit herself until the prospect of Italian unity becoming a reality was put beyond a doubt. Now she seems ready to declare herself prepared to come forward and take her share in the European drama. One by one the nations of Europe are being drawn into the coming struggle as one by one the interests they have more particularly at heart become affected. It is manifest that it must ever have been in the interest of Russia that the Power which divides her from the cherished object of her eastern ambition should be as weak as possible. It is only when the absolute annihilation of Austria comes into question that she steps in, not perhaps to prevent altogether a dismemberment from which she would have everything to gain, but to prevent that dismemberment from taking place in a manner which might produce revolution in a section of her own dominions.

Hungary, emerging victorious from rebellion, would present a spectacle so encouraging to Poland, that we can scarcely suppose that

even that country, though cowed by a long course of tyranny, could resist the temptation of endeavouring to follow the example of her successful neighbour. It is not, therefore, in the manner in which Garibaldi proposes to attack Austria that Russia desires to see her destruction consummated. The dependence upon her of the perplexed Government of Austria, and a large preponderance in its councils, would suit the policy of Russia better, probably, than its immediate dismemberment; and if this dependence is to be shared by France, and Louis Napoleon is to exercise with the Emperor of Russia a joint influence, it will only be with the view to those ulterior projects which those monarchs entertain with reference to that Ottoman Empire which is the final scope of their united policy. In the interest of Austria we should have warned her Emperor from committing himself to the tender mercies of two such friends. They may hold out for the moment the prospect of release from the difficulties by which she is encompassed, but it will only be to draw her more firmly within their grasp, for the purpose of ultimately turning her internal troubles to their own advantage, and making capital out of the state of dependence in which, by her short-sighted policy, she has placed herself. We much fear that she may be encouraged by the support which she thus hopes temporarily to obtain, to modify those concessions which have been more than half promised to Hungary, and to hesitate in developing those schemes of reform from which at one period we augured favourably of the liberal disposition of her Government. She will alienate from her an ally which, if not so powerful, would, at any rate, have been truer to her than Russia. For with Prussia she had many interests in common; with Russia she has none. Except tranquillity in Poland, Russia has nothing ostensibly to gain by allying herself with Austria at this juncture. Her objects are therefore under the surface, and lie in the vantage ground which she will obtain by placing that empire under obligations to her which involve the very conditions of her existence. England, lately disposed to look kindly upon her efforts for reform, and anxious, if possible, legitimately to retain her in an independent position as a first-class Power, will look coldly upon her now that she has formed so close a connection with the empire most formidable to our Eastern interests. For the future, Austria becomes a tool in the hands of Russia and of France, for the development of their combined Eastern policy. Not again, as during the Crimean War, will Russia have to fear a neutrality which proved fatal to the successful issue of her aggressive movement on the Principalities. When next she crosses the Pruth—and the day is evidently not far distant when this operation will be again undertaken,—it will be under very different circumstances from those which proved so cruelly fatal to the Emperor Nicholas's policy. With France for an ally instead of an enemy, with Austria bound hand and foot to follow the dictates of two land taskmasters, with the Ottoman Empire demoralized by an incessant course of intrigue and agitation, the task of dividing the territory of the Sultan will be considerably facilitated, and the position of England rendered one of the utmost difficulty and embarrassment. It is impossible, under these circumstances, that we can regard with a favourable eye the latest phase of Austrian diplomacy. Better would it have been for her to have sold Venice than to cling to it at the cost of a friendship which may prove her ruin. For with the dismemberment of the Ottoman Empire must inevitably follow that of the Austrian.

A consideration of the circumstances which called the Austrian

Empire into existence will illustrate the truth of this statement. When the Turks had poured their conquering hordes across the Danube, possessed themselves of Hungary, and threatened to devastate all Europe, it became evident to the Western Powers that a strong barrier must be erected between the Muselman invaders and the Christian nations. Hungary clung to Austria, composed of a variety of heterogeneous nationalities, sprung into existence. So long as the pressure exercised by the proximity of a valiant and aggressive nation remained in full force, it bound by a common interest the nationalities of which the Empire of expediency was composed. No sooner, however, was it removed, and the disavowal of the Turkish Empire manifested, than the discordant elements of which Austria consisted began to show themselves: a gradual fermentation ensued which ever since has been increasing, until at last the combined effects of mis-government, and mutual dislike arising from diversity of race, language, religion, and traditions, has placed that unhappy country at the mercy of any plunderer who has sufficient force to back his nefarious designs. The problem thus presented to Europe is this: Is the existence of a first-class Power, composed of the materials of which Austria is composed, possible in Europe, when no external political necessity exists to hold it together? and the problem which necessarily follows is, What is the policy which England should pursue in the event of such an existence becoming only possible, upon conditions which place that Power, with her vast material resources, in the hands of England's enemies. We have shown every disposition to maintain constituted governments, and to observe the treaties under which they exist hitherto; but if we are to fail a coalition taking place, of a character which not only threatens our nearest interests, but imperils the cause of liberty throughout Europe, we have only one alternative left us, and that is to throw ourselves into the opposite scale—oppose entirely the cause of the peoples as against their Governments, and make head against a combination which, if carried out, will extinguish every hope for the nationalities. We are prepared to hear that Louis Napoleon views with as great a distrust as ourselves this alliance between Austria and Russia. Time alone can prove whether he is no party to it. It is doubtless most important that he should not seem to desert the cause of the nations at a moment so critical to their interests; but his love of liberty is to be gauged exactly by the amount of advantage which may be gained for himself out of the agitation caused in the struggle for the principle. When it has gone far enough, and the small carls have taken all the tricks which were possible, he will bring out his troops in the shape of formidable coalitions. Then the Treaty of Villafranca will have to be observed in its integrity; and with all his love of Italian liberty, he must keep faith with Austria. Already he has protested against the action of Piedmont in the Papal States. The independence which the Italians have recently shown—the hardihood of Garibaldi, and the rapidity of his success, may have hurried on this combination more rapidly than was intended. The Venetian and Rhine Provinces transaction has been abandoned for a new complication—it is impossible even for the French Emperor to control events. He must play his cards as they are dealt to him; but we confess that the last deal has not been of a nature to inspire us with confidence; and we trust that our statesmen may attach the importance it deserves to the new European Alliance, and not put too much credit in the professions of a sovereign who has repeatedly misled them.

THE BLACK NEMESIS IN AMERICA.

HOW is it that there are so many and such fearful steamboat accidents in the rivers and lakes of America? Is it that the boats are frail?—that the captains and crews are reckless or careless?—or that speed, irrespective of safety, is the one consideration with owners, captains, and passengers? These questions have often been put, but have never, to our knowledge, received a satisfactory reply. It will be conceded as a preliminary to the investigation we propose to make, that the loss of life in steam navigation in America is absolutely greater, and accompanied with incidents more awful, than in any other part of the world. Disasters of this kind sometimes occur in Europe; but for one life lost in this hemisphere by explosion or collision, fifty at least are lost in the great streams and lakes of the West. The fact is not to be disputed; but the causes remain a mystery.

Ocean navigation is comparatively safe; and why? For three principal reasons. Firstly, it is known to be dangerous; secondly, every person employed in an ocean ship is fully aware of the absolute necessity of obedience to the commands of the captain and of his subordinates; thirdly, the persons so employed are looked upon, each by each, and by all their superior officers, of whatever grade, as responsible, reasonable, undegraded human beings. The consequences are, that every care and precaution are taken; that a good look-out is kept night and day; that discipline is maintained with the utmost strictness; and that every sailor and stoker feels a personal, a professional, and a human interest in the safety of the voyage.

In the internal steam navigation of the United States these causes do not operate. The frail build of the huge structures that ply on the Mississippi, the Ohio, the Alabama, the Hudson, and the Lakes, may be left out of consideration, because frailty of structure and hugeness of size, if not carried to such an extreme as to transgress the physical laws, are not in themselves sources of peril, but merely occasions for, and incentives to, the exercise of prudence and more constant caution. As in all preventable disasters, the cause of calamity in these cases are moral rather than physical; and it is for moral reasons that travelling, whether by the rail or by the steamboat, is attended with such frightful hazards in every part of the United States. Physiologists assert that the dry climate of the Western World stimulates unduly the Anglo-Saxon and European brain; and that men who, in our moist atmosphere, would be cool, prudent, and rational, become in that of America, hot-headed, impulsive, and reckless. Leaving this question for future discussion, and fully aware of its vast importance, we confine ourselves at present to the three points which we have mooted, and proceed to treat them *seriatim*.

Firstly, The safety of marine navigation is presumed in America. Ships, in consequence, are built of lighter materials than they otherwise would be, and less care is taken than would be insisted upon if danger were always present to the thoughts of the captain and crew, as it is on the broad ocean.

Secondly, In America, hand-work—except that necessary for the tillage of the soil—is considered less honourable than head-work. If anything approaching to the relation of master and servant is involved, the American mind revolts at the degradation. There may be “master” and “slave” in the South, but in the North, the word “master” is not recognised. There is no master carpenter, master tailor, or master builder; but instead of “master,” the word “boss” is employed, signifying the leading mind, or governor of the establishment, whatever it may happen to be. A barber’s assistant speaks of his employer as his “boss,” and would no more think of calling him master than he would of cutting a customer’s throat.

Such service as that of the British sailor in the mercantile or the royal navy is left, in the internal navigation of the United States, almost entirely to what is considered the degraded and inferior class of the negroes. These pariahs of the Western World are the stokers and sailors of the rivers and the lakes,—cheerful drudges, without intelligence, who perform work that men of the white race are glad enough to perform in Europe, but which they will not do in America while there are forests to clear, farms to cultivate, and store houses or mills to be established in the beautiful Far West. The white sailor, or mate, in America, in consequence of the prevalence of this feeling, does not yield the same obedience to his captain that would be yielded by his peers in Europe. He is a man, a voter, a citizen of the Great Republic, the political and social equal of the captain, and will not be dictated to. He asserts his dignity by disobedience to orders; and if there be a ball on board a steamer crowded with ladies—as in the melancholy case of the *Lady Elgin*, when Mr. Ingram perished,—he will, if it so please him, take his part in the festivities, and leave the vessel to take care of itself.

Thirdly, The employment of negroes in all the hard work of ships, in the Southern as well as in the Northern States, coupled with the enslavement of the race in the South, and their degradation in the North, by the refusal of whites to ride in omnibuses, sit in theatres, or go to church with them, creates a state of things in many parts of America which amounts to this: that the captain of a steamboat and his ticket-collector are the only white persons in authority, and that the whole work of the ship, above decks and below, is left to the negroes—men who, because they are looked upon as inferior beings, become, with greater rapidity than their white youths imagine, in the best of times, and in the best of climates, a degraded race. It is not surprising that he should accept his destiny, lead a merely physical life, and throw all care and responsibility upon his white oppressors.

In one sentence, negro slavery in the South, and negro oppression in the North, combine to form that “Black Nemesis” of America from which we have taken the title of our article. Treat a man as a man, and he will do his duty like one. Treat him as a brute, either by positive slavery, or by social ban and anathema, and put him into situations of trust, and the natural consequences will result. The brute nature, and not the human nature, will display itself. It may be servile in one part of the country, while in another it may be ignorant and brutal, and therefore dangerous service. If you degrade a man to the rank of a baboon, and then make him a stoker and an engineer, what can you expect? That which you receive: calamity, disaster, and death.

MORE LIGHT ON THE ITALIAN QUESTION.

LIGHT continues to break in upon the question of Italy. Since our last publication two circumstances have occurred, which combine in different ways to define the position and the task of Garibaldi on the one side, and Victor Emmanuel on the other. The Emperor of the French has reinforced his garrison in Rome, and will

maintain the Pope in possession of the Eternal City, a certain district around it, the port of Civita Vecchia, and perhaps Viterbo. The British Government, in the person of its Foreign Secretary, has notified to Sardinia the inexpediency of making any attack upon Venetia, lest a general European war should be the result; and Lord John Russell has intimated, at the same time, that Great Britain has interests to defend in the Adriatic;—a very suspicious announcement, which, if Parliament were now sitting, the Government would have to explain, and for which it will most certainly be called to account hereafter.

We believe, however, that Victor Emmanuel and Garibaldi, who seem to have partially, if not completely made up their late differences, will give to both of these facts the significance they deserve, and allow the Emperor of the French to uphold, in his own way,—and in the way to which his honour and dignity are pledged,—the spiritual supremacy of the Pope in Rome. All the Papal States are virtually incorporated with the Italian kingdom, and if King Victor Emmanuel be King of all Italy, with the sole exception of the city of Rome and its appurtenances, and the province of Venetia, he and the Italians generally will have made a very good business out of the late and present wars of the Peninsula. It will not be wise to attack the French in Rome or the Austrians in Venetia—even though every Italian heart may feel that it would be very desirable to get rid of both, and that France has no more valid right to uphold the Pope than Austria has to oppress the Venetians. But the world is a world of facts as well as of ideas; and if the men who are now at the head of Italian affairs in the North and in the South will agree to recognise the inevitable logic of events, and consolidate the actual gains of the Italian cause, without putting them in jeopardy by ineffectual struggles for more, it is likely that their discretion—the better part of valour in all doubtful cases—will be duly rewarded hereafter.

The Pope, if left in Rome with merely spiritual power, and the personal revenues of a Prince of the Church, would not be a very heavy burthen upon Italy, and could not, so short of honour, very greatly interfere with the constitutional liberties of the people beyond his own boundaries. He would speedily have no other subjects but priests, and Rome would be entirely ecclesiastical. The question of Venetia would every day become of easier solution. As we have said before, Austria will not be driven out without a mighty struggle, and perhaps a European war; but with patience and tact, her position, already painful and almost untenable, will be rendered so desperate that she will be glad to sell, for a fair price, the discontented and troublesome province, which, under present circumstances, she can neither safely keep nor safely let go. Thus the task for Victor Emmanuel—for Cavour—and for Garibaldi, resolves itself into this: to consolidate what they have got. Neither France nor Austria will interfere with them in that respect; and when they have done this,—and when all Italy, except the city of Rome and Venetia, is peaceably subject to the constitutional rule of the king of its choice,—the difficulty as regards Venetia will diminish day by day, and a free and united Italy—one and indivisible—will become possible without further bloodshed.

Lord John Russell, in his letter to Sir James Hudson, gives good advice in a bad spirit; but the advice is not inconsistent with the idea that the best way to get Austria out of Italy is to buy her out. That is and has been our own opinion ever since the Crimean war, when the subject was first mooted; and we believe it is one which will recommend itself more strongly to the Italians themselves, as well as to all the neighbouring nations, the longer it is reflected upon. But at the present moment to attack the Quasi-eternal, or the French in Rome, would imperil not alone the recently emancipated duchies, provinces, and kingdoms of Italy, but Sardinia itself.

SOCIAL SCIENCE AND LAY INTOLERANCE.

THE gathering at Glasgow has met with much more attention than expectation. It is generally felt that the Congress aspires to exercise the functions both of the Press and the Parliament, for both of which it is ill adapted. It discusses subjects which have already been amply treated of, or which are not yet ripe for discussion. It wants to forestall others, and acquire a foremost place in public estimation. Social Science is merely a knowledge of the natural laws which regulate society methodically arranged, beginning with the principle of population, obviously the foundation of the whole—its origin, its continuance, and its growth. With this the Congress confounds the art of the statesman, and discusses, without any peculiar advantage or exclusive knowledge, what he has done in past time, what he is now doing, and what it thinks he ought to do. It confines its discussions, also, to what our own statesmen have done, or are doing, or ought to do, which is much better discussed in Parliament and the Press. Though much discussion may be very useful, and may enlighten both the public and statesmen, it is no more Social Science than the construction of telescopes is the science of astronomy, or making salt is the science of chemistry. The Congress is recognised by the public as merely a collection of would-be politicians aspiring to obtain influence and honour by an unusual combination.

The world can but entertain great respect for the vigorous old man who, at eighty-two, fights over again all the battles of his life, and reminds it of the many victories he has won. We are not amongst those who object to this generation imitating the career of the noble hero, and promoting correct political knowledge by continuous discussion; but it is singular to find Lord Brougham using the strength he still possesses to denounce the abundant talk by which he obtained all his celebrity. It beggars the suspicion that if he had still a legitimate influence in Parliament, he would not harangue at Glasgow. If he were Lord Claudon, he would have other duties to perform than to provide over congresses of doubtful utility. If he had triumphed over Lord Melbourne, as over Lord Grey, and retained his seat in the Cabinet, making his way to the high place in his sovereign's confidence so long held by Lord Thurlow and Lord Eldon, or to the position still filled by a man almost as old as himself, he would not have been anxious to secure the applause of political chandlers, or the workers at Glasgow and Paisley.

If even Lord Brougham's philanthropy may be suspected of springing from rather low motives, we may suppose that if Sir J. Kay Shuttleworth had been completely successful in his projects for indoctrinating the people, and had carried the Council and the Parliament at his heels,—that if Mr. Chalmers still held the office of manipulating the Poor Law, with liberty to devise, and recommend, and print, at the public expense, numerous projects for moulding the multitude after his pattern,—if Sir Emerson Tennant had not effectually shut himself out of Parliament by his provident care to not himself in a permanent office,—if the Hon. Arthur Kinnaird, M. P., could have been sure of finding an audience in the House of Commons to applaud his very attacks on "servant gollies," and on the poor who do not mend their own clothes and make them out of the bowels of the earth,—if Dr. Guthrie could have induced the Government to give him money for his Ragged School,—none of them probably would have been very prominent members of Congress.

Their President denounces Parliament for excessive talk, and they have elected a parliament of their own, without the restraint of a Speaker and Standing Orders, in which disappointed men may indulge their passion for speaking. The Congress seems to us to have an unworthy origin, and it has treated many grave subjects in a trite, hasty, and superficial manner. Its juvenile aspirants for political distinction have neither the advantage of previous preparation possessed by members of Parliament nor by writers for the press, nor of the deep study which ends in works of profound wisdom. They are obviously more eager to obtain applause than to deserve it. They congregate to praise each other, and remind us of the family of Adolphus, as described in the "Anti-Jacobin" by Canning, assembling in Parliament to cheer its chief. However much their own voices may flatter them they have not won the admiration of the world.

To their harmless vanity is added gross intolerance. The members are lay inquisitors, and appeal to the Legislature to constrain all men to walk in the paths they find pleasant. They would make us all like themselves. Nature delights in diversity and multifariousness, and makes one man different from every other; they would thwart her intentions, and reduce us all to their standard. They are obtainers, or testators, and they insist that there is no virtue but in doing as they do. They have not even the spirit of originality, for they model themselves on some famous for sobriety in the great republic, and would establish the Maine Liquor Law as the universal rule.

All men are to be educated as they have been. What would become of society were it composed entirely of men like themselves—of Broughams, Shuttleworths, Pakingtons, Alisons, and Kinnairds—can be easily imagined. It would perish. The very diversities of disposition and pursuit, of taste and inclination—which they would limit and reduce to their own idiosyncrasies,—constitute the very glory, greatness, and utility of society. From them spring the multitude of our arts, and the mutual dependence of individuals. Excess in dress or luxury in any or all classes, intemperance of all kinds, a disregard of the laws of health, are all to be deplored; but experience teaches that they cannot be remedied, though they are dwindling away by coercive laws. The members of Congress seem to share the opinion lost in possessing diversities of taste, and while some of them would coerce the people into sobriety, they almost require the police to keep the peace in Congress between impenitents of smoking tobacco and the defenders and lovers of cigars.

They take no notice of the education which enables men to perform their duties to one another under the dispensation of division of labour common to all. There must be farmers, manufacturers, merchants, smiths, weavers, shoemakers, miners, &c., each expert in his own calling; and the education which gives this expertise is the education truly valuable to society. But boys learn these duties from what they see,—they learn from their fathers or their masters, and so learning, the acquired skill of mankind, improved in every successive period, is kept in life, and handed down from generation

to generation. As an illustration of this mode of acquiring knowledge, we may mention that Mr. Osler, the glass manufacturer, told a Committee of the House of Commons that he had been unable, by many years' exertion, to discover how to make dolls' eyes, but he learned it at once from seeing it done; then he established a large manufactory of them, and reduced the price, to the cheapening of these useful toys to all the females of the empire. This kind of education, then, by the eye—by example—is the true kind by which society is continued and improved. But this important part of Social life cannot be contrived, nor education in it imparted by paid officials; and so it offers no temptation to the politicians assembled at Glasgow to discuss it.

We should write an article as long as Lord Brougham's speech did we enumerate a title of the subjects—such as General averages, Appellate Courts, Bankruptcy Laws, Local Courts, Smoking Tobacco,—which this important body disposed of in a few sittings. What is most objectionable in the proceedings is the want of interference which it lent to the demands of individual members for additional interference with the common business of life, when, if there be one thing more emphatically taught by Social Science than another, it is that this kind of interference is extremely pernicious. Though the Congress have brought discredit on it by assuming its name, and treating under it of almost all imaginable things, we must earnestly assert that it has a definite object, and the name a definite meaning. Nay, the science is and must be studied by public writers and statesmen, before they can form correct ideas of the general principles of legislation, or have the least chance of correctly anticipating the probable consequences of any particular law. The discredit thrown on the subject by economists and radicals ought not to lure the public aside from a steady contemplation of the only means by which the natural constitution of society can be understood, and the welfare of all promoted by voluntary exertions.

AMERICAN RAILROADS.

WHEN Sydney Smith wrote his famous letter to the Pennsylvanians, American securities of all kinds were in exceedingly bad repute. Repudiation was a word in common use,—though it must be said in justice to our Transatlantic cousins, that only one state—Mississippi—ever repudiated her debts, and that Mississippi has gone down in the world ever since, and has lost all credit at home as well as abroad. Even so lately as 1857, American securities were at a low ebb, and American railway shares, in which Englishmen are so largely interested, suffered by a fall prices at a serious discount. But within the last two years, a change for the better has taken place. Even the Illinois Central, in which one of the most eminent of living Englishmen had perilled a large portion of his well-deserved fortune, has gone up; and the impression has gained strength that American railroads, under an improved management, offer one of the best possible sources of investment.

The country is rapidly increasing in wealth and population. The people may be almost said to live upon the rail, so much do they travel; and unlike our old country, the railway is in many cases the first road ever made, and does the same duty as our old highways. In addition to these advantages, land may be had for next to nothing; there is no compensation to be paid to wealthy landowners for cutting through their estates, or destroying the "amenity" of their country houses;—there are no law or parliamentary expenses worth speaking of; and no magnificent stations or depôts, like those with which England is studded, to engulf the capital of the shareholders. The only serious drawbacks are inefficiency of management, and control over the conductors and check-takers, and the running of lines through thinly-peopled districts. But care has greatly remedied the first of these difficulties in the way of good dividends, and time is fast remedying the other. American railroad investments have, for these and other reasons, become lately as much in favour as they were formerly out of it; and when for the first time in six years the shares of a great new American line have been offered to the acceptance of the British public, they have rapidly been taken up, principally by small investors from all parts of the country, and independently almost of the Stock Exchange.

The Atlantic and Great Western Railway, connecting the important cities of New York and St. Louis, is a necessary link in the completion of a mighty chain, and was certain to be made at one time or another. Already, such is the growth of the American Republic westward from the Atlantic seaboard, complaints are daily made from the new States, which are yearly rising into vigour and wealth in and beyond the Prairies, of the uncontrolled position of Washington. The route runs fix upon St. Louis, nearly fifteen hundred miles up the Mississippi from New Orleans, as the more fitting site for the federal metropolis. But Nature has so richly endowed St. Louis, that it has no need to become the federal city, to obtain advantages which agricultural and mineral wealth will shower into its lap, quite irrespective of political considerations. The effect of the building of the road connecting this important and growing city with New York and all the Eastern sea-board, is shown

on the New York and Erie shares, so largely held in this country, which have advanced from 10 to 38. We only know one other railway line more important than this, the Atlantic and Pacific, which we hope to see made, not in the territory of the United States, but in that of Great Britain, having its one terminus at Halifax, and its other on the shores of the Pacific, opposite Vancouver. When that line is made, as it must be ere long, it will form a new era in the history of North America.

THE REVENUE.

IT is too early yet to form correct opinions of the effects of the alterations made in our system of taxation by Mr. Gladstone, which mostly came into operation in the beginning of March. We learn only from the revenue returns for the year ended the 30th ult., that the total net produce of the taxes was £70,809,977, against £65,990,297,—an increase in 1860, to that time, of £4,819,680. Very nearly the whole of this increase, £4,623,710, is due to the Income and Property Tax, which Mr. Gladstone raised to 10d. in the pound. The other taxes seem not to have increased in productivity.

The Customs Duties, which, at the commencement of the year, yielded a greater sum than the Chancellor of the Exchequer anticipated, now show, in consequence of the reductions he made in them and the duties he abolished, a decline in the year of £1,421,371; but whether this be wholly the result of the changes then made in the duties, or of some falling-off in consumption, we are not certain. We see by the trade tables, that in eight months the consumption of wine has increased from 4,811,017 gallons in 1859, to 5,165,935 gallons in 1860, or about 13 per cent., which does not come up to what was expected from the reduction of the duty, and is very little above the increase of consumption in the year before. The consumption of coffee, cocoa, tins, tobacco, foreign spirits, &c., also, has increased; but the consumption of sugar and tea has declined considerably,—sugar from 6,314,916 cwt. in 1859, to 5,942,191 cwt. in the present year; and tea, from 53,834,173 lbs. to 51,816,830 lbs. In the last quarter, the decline in the Customs revenue, as compared to the corresponding period of 1859, was £688,866; in the half-year, £1,064,507; and in the entire year, £1,412,371. On the whole, though it is yet too early to form a decided opinion, the Customs Duties have, we think, fallen below the Chancellor of the Exchequer's calculations.

In the year the Excise has yielded £1,385,000 more than last year; in the last six months, however, as compared the corresponding period of 1859, it yielded £291,000 less, and in the last quarter £460,000 less. The bulk of the increase accrued in the March quarter, and was the consequence of the Chancellor calling up the Malt credits—not of increased consumption of excisable articles. In fact, in the six months for which we have the Excise Returns, the malt retained for consumption was only 28,114,454 bushels against 29,194,089 bushels in the six months of 1859, and the Paper only 98,039,172 lbs. against 98,421,578 lbs., while the Spirits retained for consumption was only 27,000 gallons more than in the first six months of 1859. These are unquestionable proofs that the yield of the Excise Duties is declining, and that the rate of increase in the national prosperity has been this year retarded. Our foreign trade has increased, but our agriculture has been less successful.

The Stamp duty yielded £279,277 this year more than last; but the bulk of this increase arises in the last quarter, and is the result of the new Stamp Duties on dock warrants, contract notes, &c., established for the first time in the late Session, by Mr. Gladstone. The Assessed Taxes, the Post Office, and the Crown Lands, show each a slight increase; but the returns generally indicate a check to the rapidity of the national progress. Not that the industry and energy of the people—the true and only sources of national growth—have abated one jot; but the comparatively small return for their labour on the land this year has in degree diminished their expected income, lessened their expenditure and enjoyment, and checked the growth of the revenue.

Seventy-one millions, almost, is an immense burden, in addition to all local charges, to lay on the people in time of protracted peace, but the manner in which they run along with it, faster and faster, the national resources increasing year by year, and the Government being able, if necessary, to raise easily half as much more, convinces us that our popular system, in spite of its vast expenditure, presses less on the people than the shabby skinning despotisms of the continent. Far from being like some of them, on the verge of bankruptcy, or actually bankrupt, our Government is rich in the wealth of its subjects. In good time it knocked off the cumbersome fetters which short-sighted ignorance had placed on their industry, and it is rewarded by increased power. If, as we think, these returns indicate a retarded progress, let it be remembered that this is the temporary consequence of an extremely unfavourable season; but let it also convince statesmen that it is easily possible for them to fall suddenly into all the difficulties of a deficient revenue. Taxation, whether direct or indirect, is so replete with unavoidable evil

physical and moral, that Government, of which the supreme duty is to protect property, is inexorable, whatever may be the national prosperity, for inflicting it in the smallest degree unnecessarily on its subjects. Its evils are instant and certain, and it may at any time hurry the Government into dissensions, and society into confusion and anarchy.

THE GOUTY PHILOSOPHER.—No. XIII.

MR. WADSWORTH EXPLAINS HIMSELF ABOUT "NUTSHELLS."

MAY I not, as a freeborn Briton, sit by the roadside, or at my own open window, and crack nuts? And having cracked the nuts, may I not, without breach of law, or propriety, or reasonable ground of offence to anyone, throw away the shells? These questions are not so trivial as they may appear, and I proceed to explain why.

In my youthful days, when I had less money and more audacity than I have now; when my laundress and respected sister was lord of Wilbye Grange, and beside me an annual allowance, which ought to have been sufficient, but which I did not contrive to make so; I set up a Mouthy Review, for the dissemination of my political and literary opinions. In that happily defunct periodical I sowed the wild oats of my youthful fancy; and first recommended myself to the good graces of the constituency of the borough that afterwards chose me as its representative to Parliament. Costly as I found it to add M.P. to my name, I found the Review a much heavier weight upon my resources. I have kept hounds and horses, and once I was foul enough to keep a yacht, but all these follies were inexpensive and trifling compared to the burden of that great literary organ, which I ground for some time with the pertinacity of a grimy Sarsaparil annoying Mr. Tallboys;—and which, when not grinding, I was forced to carry on my own back, without help from anyone. My other extravagances only affected my purse; but this affected both my purse and my brain,—and drew so largely upon both, that I was compelled, after a couple of years, to quench the light, and hush the taunt, and cease to be a public instructor, except in my night in Parliament.

But as an Editor, I believe I was conscientious;—and this brings me to NUTSHELLS. In the exercise of my function I strove to be fair, honest, and impartial. I never implied a ruthless and pre-judged dogmatist, or held him up to the world's applause as a model sovereign. I never called a political measure good if I thought it bad, or, for party reasons, praised Mr. Rigby when I thought Mr. Rigby was wrong. I never affirmed a dull book to be interesting, a stupid one to be full of genius, or an incorrect one to be trustworthy. I never represented a wretched dandy to be a fine picture, or a thing not good enough for a figure-head to be a statue worthy of Praxiteles. I never allowed my theatrical critics to taunt the musy tragedians or fusty farces of their acquaintances, unapologetic or creditors, at the expense of truth, justice, or the patience of my readers; or suffered them to land a mauler and a natter as a tragedian; or to dignify a mountebank with the title of a comedian. Let it not be supposed that I did not candidly endeavour to discover merit. On the contrary, if I found it, young, unobscured, and friendless, I did my utmost to draw it out and put it in the way of making reputation and fortune. And when I praised an author or an artist, as an orator or a financier, my praise was worth having, because it was genuine, and was neither venal, tame, or unwarranted by the facts. But the result of my justice and impartiality was, that I made enemies of great numbers of people whom I did not know, and whom I had never either seen or heard of; and that more than once a "genius," (not such in my estimation)—suddenly started up before me, to call me to account for throwing NUTSHELLS in his eyes, or in those of his son. Of course everyone remembers the story of the Merchant and the Genius in the "Arabian Nights!"—

"When the merchant (says the immortal story-teller) was satisfying his hunger with biscuits and dates from his little store, he amused himself with throwing about the stones of the bait with considerable velocity. When he had finished his frugal repast, he washed his hands, his face, and his feet, and repeated a prayer, like a good Mussulman."

"He had hardly made an end, and was still on his knees, when he saw a Genius, white with age, and of an enormous stature, advancing towards him with a scimitar in his hand. As soon as he was close to the merchant, the Genius said, in a terrible voice, 'Get up! that I may kill thee with this scimitar, as thou hast killed my son.'"

"The merchant, alarmed by the terrible figure of this monster, as well as by the words he heard, replied, in trembling accents, 'Of what crime, alme! can I, my good lord, have been guilty towards you, to deserve the loss of life?'

"I have sworn to slay thee, as thou hast slain my son."

"Good God!" answered the merchant, "How can I have slain him? I do not know him, nor have I ever seen him."

"I didst thou not," replied the monster, "take some dates from thy wallet, and throw away the stones?"

"It is true," replied the merchant; "I don't deny it."

"Well, then," said the Genius, "thou hast slain my son. Whilst thou wast throwing about thy date-stones, my son passed by. One of them struck him in the eye, and caused his death."

The application of the story is palpable. Though I seldom wrote reviews myself, but entrusted the task to competent critics, every rhymer, novelist, essayist, book manufacturer, and blunderbuss of literature, put to my individual account every disagreeable word that appeared in my Review. And worse than that—even the meanest and stupidest citizen of the great and populous republic of Scribblewood considered my neglect to be a greater injury and insult than the most savage criticisms, and pretended to hate me far more for my silence than for my hostility. En-

grossed, very often, with far weightier matters, I was sometimes unconscious whether these literary lights had been trimmed or snuffed out, praised, condemned, or ignored; and sometimes did not even know their names. But it appeared that I could not quietly eat my dates or crack my nuts without hitting some plagy and invisible "genius" in the eye. Thinking of no evil, and proceeding to prune the rose-trees in my garden walks, or to eradicate the wild convolvulus from my lawn, they would suddenly appear before me,

"Black as night, fierce as ten furies,
Terrible as hell."

—a monster worse than him of the Arabian story. He would show himself, either personally or by letter, or perhaps in the columns of a rival Review, insisting upon taking my literary soul, as the penalty for the unconscious murder done by my innocent nutshell. Brandishing his tomahawk, one fend would endeavour to seize me in the death-grasp, making loud lamentations for the child in the prison on which he had set his heart. Another demon, in the form of a woman, aged forty-five, with stockings, not of red, but of blue, and holding in her hand the three volumes of her last novel of "Love, Plory, and Money"—horrible vision, of which the nose was long and red at the tip, the hair and the front teeth false, the fingers yellow and thin, the eyes preternaturally bright, and the voice shrill and discordant!—would vehemently shriek for revenge, weeping like Rachel for her three volumes,—and refusing to be comforted, because they had been received either with disfavour by my unucky Journal, or, worse still, with a dead silence. How I pacified these perturbed spirits it boots not now to tell. At first I was sorely troubled by them, and thought that no man in this world could be so unfortunate as an impartial Editor. But I grew wiser as I became more experienced in the mysteries of the craft, and soon learned to bear their visits and their abuse with the greatest equanimity. My nuts were my nuts, and so were the kernels. If the shells had injured invisible passer-by, it was not my fault for being palpable, but theirs for being invisible. Conscience, the great judge to whom I put the case, not only absolved me from blame, but put me on the heel for being a good boy.

Since that time I have built a superstructure of prudent philosophy on the foundation of these nutshells. Many a time and oft I have consulted myself under real or imaginary slight from a friend, or insult from a foe, by the quiet reflection that I might have "thrown a nutshell in his eye." If the Duke of Bogtrotshire gave me the cut direct, though he had formerly been in the habit of talking to me in Pall Mall and at the Club, and once asked me to an evening party, at which there were about five times as many people as his rooms could hold, I accounted for the fact by nutshells. If Mrs. Smiler invited me no more to her literary and musical soiree, I put the catastrophe to the debt of—nutshells—and maintained my soul in peace. When I published my great political treatise—now dead, buried, and forgotten,—and a reviewer in the *Weekly Standard* attacked me and not my book, I came to the conclusion that nutshells or date-stones were at the bottom of the mystery. I thereby escaped much needless misery and damage to my self-love. In short, I became satisfied that nutshells are the body and soul of a philosophy that will enable a man to get through the world with fewer hard rules to his self-esteem than he would otherwise experience. Why attribute adverse criticism to one's own demerits or stupidity? Why, if your aunt scratch you out of her will, place the unpleasant fact to any real crime or deficiency in yourself? Why, when your rich and powerful friend knows you no more, should you do yourself the injustice of believing that you deserved his disfavour? Nutshells will account for all; and if they do not heal your misfortunes, they may act as a salve to your wounded vanity.

Though I long ago ceased to be an editor, I continue to crack my nuts with the same equanimity as ever. Those who complain of the shells that I cast on each side of me are the fools and unfortunates, and not I. Let the stupid geniuses either keep out of my way, or disclose themselves visibly and palpably before me. If I see them, sure am I that no date-stones or nutshells of mine shall hit them, either in front or behind, in the eye, or elsewhere; but if I don't see them, and could not see them, either with a telescope or a microscope, or through my ordinary spectacles, were I to try ever so desperately to do so, what right have they to complain? But whether they complain or not, it is all the same to John Wagstaffe.

And you, oh, friendly reader of these lines, successful or unsuccessful, great or small, wise or stupid, think upon NUTSHELLS, and be consoled under the rubs and buffettings that you may have to endure from Envy, Spite, Malice, and Uncharitableness. What mad Sisylock hate Antonio! NUTSHELLS! What caused the Athenians to banish Aristides! NUTSHELLS. Every time that he was called "the just," a nutshell flew into the jaundiced eye of some invisible snail, who detested him evermore. The straightness of a man's spine may be a nutshell in the eye of a hunchback, and deserved Prosperity a sharp and hard-hitting nutshell in the eye of equally deserved Adversity. Smeuldungus has lost his nose—I will not say how; and whenever a man passes him with that noble member intact, and handsome as Nature made it, Smeuldungus feels a nutshell in his eye, and hates the good fellow who never heard of him or of his infamy. Every man in the world is some or other of a nut-cracker; but great men crack more nuts than small ones, throw about a greater quantity of shells, and consequently make more enemies. There is no help for it. Greatness has, at all events, this consolation; it not only cracks its nuts, but eats them, and cares nothing for the consequences.

THEATRE ROYAL, HAYMARKET.—MISS AMY SEDGWICK, and DOBIE REE LOVE ME? every evening. Also, first time, a New Comedy, entitled *ROMANCE AND REALITY*, written by Mr. JOHN BROUGHAM, formerly of the Theatre Royal, Covent Garden and Drury-lane, and in which he will make his first appearance since his return from America.—*MONDAY*, 7, at 8 o'clock, Mr. Brougham, with DOBIE REE LOVE ME? Mr. Brougham, Miss Amy Sedgwick, &c.; after which, *ROMANCE AND REALITY*, concluding with the new Ballet of *THE SUN AND THE WIND*.—Box office open daily from 10 till 8.

NEW THEATRE ROYAL, ADLPHI.—Sole Proprietor and Manager, Mr. H. WEBSTER.—Great success of the New Drama by Dion Boucicault, Esq., *THE COLLEEN BAWN*.—Miss AGNES BURRINGTON and Mr. DION BOUCICAULT every evening.—*Monday*, 7, at 8 o'clock, *THE COLLEEN BAWN*.—Messrs. W. Smith, D. Fisher, Selby, Mrs. Webster, K. Kelly, and Mrs. Billington. *THE COLLEEN BAWN*.—Messrs. D. Boucicault, D. Fisher, Billington, C. Smith, Bower, W. Smith, Miss Agnes Burrington, Mrs. Webster, Mrs. Billington, and Mrs. Charterley. To conclude with MUSIC BATH CHARM: Mr. D. Fisher, Bower, Warley, Miss K. Kelly. Commence at Seven.

CORREGGIO'S ECCE HOMO, the long-sought Replica of the National Gallery Picture, which the most eminent judges pronounce the finest painting in this country, is ON VIEW, from Ten till Nine (Admission, 6d.), at GARDNER'S GALLERY, 110, Oxford-street.

THE RELIEF OF LUCKNOW.—The Triumphant Meeting of Havelock, Galt, and Colin Campbell, surrounded by their Bravest Companions in Arms, ON VIEW AT HAYWARD AND LEGGAT'S, 79, COVENTRY-ST. Admission Free, by Private Address Card.

SUBSCRIPTIONS for "THE LONDON REVIEW" received by Messrs. W. H. SMITH & SON, at 65, Strand, and at all their Railway Book-stalls.

PESSE & LUBIN'S SWEET SCENTS.—Fragranci, Kiss-me-quick, White Rose, and others, from every flower that breathes a perfume, in bottles, 2s. 6d., 1s. 6d., or three in a cabinet, 2s. 6d. For the Retailer, 1s. 6d. per dozen. Wholesale, 1s. 6d. per dozen. Laboratory of Flowers, 2, New Barn-street, London.

SCALE OF CHARGES FOR ADVERTISEMENTS.

For a Line, 2s. 6d.

Every additional Line, after Four Lines, 5s. 6d.

Advertisements exceeding One Column in Width are charged in proportion.

THE LONDON REVIEW

WEEKLY JOURNAL.

SATURDAY, OCTOBER 6, 1860.

WHEN we last adverted to the military tactics adopted by Garibaldi in his attack on the Royalist army, we stated that in order to command the plain of Capua, and separate it from the fastnesses of the Abruzzi, and the plains beyond the Apennines, he had taken up a strong position at Cajazzo, between the upper and lower basins of the Volturno. On the morning of the 23rd ult. the sentries of the revolutionary troops at this place gave notice of the approach from Capua of a body of 5,000 Swiss and Bavarians, and 3,000 Neapolitans. Their attack in such force was irresistible. For a whole hour, however, the Garibaldini withstood a terrible cannonade. It was not until their ammunition was exhausted that the colonel ordered a charge with the bayonet. The native troops yielded, but the mercenaries did not. A frightful butchery ensued, quarter being neither asked nor given. Houses were burned into which wounded men had been carried; volunteers in flight, swimming for safety across the Volturno, were killed by hand grenades thrown at them, and Cajazzo was taken. This defeat is the first important check which Garibaldi has sustained since he entered the mainland. Four hundred of his followers have been placed *hors de combat*. The loss of prestige which has followed has, however, to some extent, been redeemed by a triumph over the Royalists at Limetola; it has nevertheless produced a very marked change in the general tone of feeling at Naples, and the arrival of the Piedmontese troops, which are now drawn up close upon the southern frontier of the Papal States, is anxiously expected at Naples.

On Friday, the 28th ultimo, the Sardinian fleet having, by a bold manoeuvre, destroyed all the batteries of the port of Ancona, Lamerice, seeing that it was of no avail to continue his desperate resistance to overwhelming numbers, offered terms of capitulation. The French general, wishing to express his admiration of the gallantry of the Piedmontese admiral, surrendered to him, and was received on board the fleet with military honours not usually accorded to a prisoner of war. In his portfolio, which has fallen into the hands of the enemy, it is said that letters have been found of the most compromising character, with the most positive proofs of his having entered into intrigues with the legitimists, and even the red republicans, against the Government of the Emperor Napoleon.

The policy to be pursued by the English Government is so far indicated by a despatch published in the *Cologne Gazette*, dated the 31st of August last, from Lord John Russell to Sir James Hudson, the British Ambassador at Turin. In this document the English minister points out the consequences which may follow to Sardinia if the king should attack Venice. The Great Powers, he says, are at present bent upon the maintenance of peace, and Great Britain has interests in the Adriatic over which she keeps careful watch.

This despatch has, doubtless, not been without influence upon the policy of the Government of Turin, as set forth in a speech made to the Sardinian Parliament by Count Cavour, at their first meeting on Tuesday last. Henceforth, he said, Italy is free, with the exception of Venetia, for the recovery of

which, however, Piedmont cannot make war upon Austria against the almost unanimous wish of the European Powers. These reasons, he added, also impose upon Sardinia the duty of respecting Rome; and he concluded with a request that the Parliament will decide upon the point for which it had been convoked, viz., whether the existing Government enjoys its confidence, an expression of opinion at this crisis being all "the more necessary, as a voice in which is dear to the people has manifested its distrust of the present ministry to the crown and the country." After this address had been delivered a project of law was presented to the Assembly with a view to confer authority on the king to accept the annexation of those provinces of central and southern Italy in which the inhabitants, by universal suffrage, shall freely manifest a wish to form an integral part of the constitutional monarchy of Sardinia. A committee was appointed, who, on Wednesday, expressed full confidence in the policy of Count Cavour, but desired that all conflict with Garibaldi should cease.

The *Military Gazette* of Turin announces the fact that the king is to proceed forthwith to Naples; while Garibaldi, in an order of the day, published at Caserta, informs his troops that the Piedmontese army will shortly cross the Neapolitan frontier. Victor Emmanuel is now between Bologna and Ancona, on his way, it is understood, to Naples. This decisive step on the part of Victor Emmanuel has been hastened not only by the repulse sustained by Garibaldi at Cajazzo, but by the general discontent expressed with the men into whose hands the conduct of public affairs at Naples has fallen. On the 24th, a deputation of the municipality waited upon the Dictator to express an opinion that certain recent measures are inconsistent with the principles of sound constitutional liberty hitherto respected throughout the Italian Revolution. To this protest Garibaldi replied that he will not intrust the government to any but such who enjoy public confidence, and never under any circumstances allow the army of Southern Italy to contend with that of Piedmont. In conformity with these resolutions he has published the list of a new ministry, consisting of men belonging to the moderate party, that is to say, of those who are favourable to speedy annexation.

In anticipation of these re-assuring facts, a deputation is on its way from Naples to Victor Emmanuel, with the purpose of urging him to proclaim annexation without delay. An address, numerous signatures, has been at the same time transmitted to him, in which he is implored to hasten his journey to Naples, there to consecrate Italian Unity, and restore peace and tranquillity to the kingdom. The monarchists say that they wish to see the veterans who fought at Palestro and San Martino fostering with the brave youths who, landing at Marsala, few in number, but aided by the population, have delivered the most faithful—and not the least fair—of the Italian provinces, in order that all may march from Naples guided by the wisdom of a King of Italy, and aided by the boldness and genius of Garibaldi, to overthrow the remaining enemies of Italy, and complete the work of national redemption.

The reconciliation of Garibaldi and the Court of Turin is jealously watched by the Mazzini party at Naples, who have circulated a proclamation protesting against the absorption of the Italian provinces into Piedmont, and claiming for all of them the right to co-operate with perfect equality in drawing up a political and civil code for Italy. It is said that they have been getting up addresses among the soldiers, with the view of urging Garibaldi to proceed to Venice, it being the opinion of Mazzini that the Italian army must fight the Austrians before they can obtain possession of Rome, which, nevertheless, he considers essential to the unity of Italy. The extreme party, however, repudiate all interference with the course of events. In the mean time, they have resolved to sink their republican views in the cause of Italian Unity. When this great object has been accomplished, they will continue to advocate democratic measures, as tending towards a goal which may not be reached in this generation. Mazzini says that he has gone to Naples to enjoy the bright skies, to recruit his health, and with no purpose of meddling in politics.

The news of Garibaldi's defeat before Capua had no sooner reached Palermo than the Royalist garrison in the citadel opened a fire of grape and round-shot upon the citizens. Great excitement prevailed at the date of the latest intelligence, although, on the representation of the foreign consuls, the bombardment had ceased.

While the Royalist party in Naples has been cheered by the temporary successes of the ex-King against Garibaldi, the Spanish Government have addressed a circular note to the various Powers, recalling the treaties by which the rights of the Neapolitan Bourbons are guaranteed, and supporting the protest issued by the King, before retiring to Gaeta, against the invasion of Naples.

The views of the French are of more importance than those of the Spanish Government. The *Moniteur* of the 30th ult. announces that a division of infantry, two squadrons of cavalry, and a battery of artillery, are to embark at Marseilles, in order to reinforce the corps of occupation at Rome, and that General Guyon has been authorized to extend his action as far as the military conditions to which it is naturally subordinate may permit him. The Emperor, adds the official journal, will continue to fulfil, conformably to the mission which he has assumed, the duties which his sympathies for the Holy Father impose upon him. What this mission, these duties, and these sympathies are, it would be hard to say, seeing that Napoleon III. has it in his power to forbid the Piedmontese from invading

the territory of the Pope. The despatch of troops from Toulon has already commenced.

The great debate on the Constitution, in the Reichsrath, was brought to a close on the afternoon of the 27th ult. On a vote being come to, fifty-six members voted out of fifty-eight, thirty-four for the programme of the majority in favour of federation and local institutions, and sixteen for that of the minority of the committee, and in favour of centralization. The Archduke President dismissed the Council, after having warmly thanked its members for their self-devotion and activity. Artillery, ammunition, and supplies of all kinds continue to be sent into Venetia, while several regiments of the line are under marching orders to proceed to the same destination. It is said that the Government has now in its hands evidence that there has been a constant correspondence kept up between the new Neapolitan Government, the Venetians, and the Magyars. Throughout the Austrian empire a levy of 100,000 men has been resolved upon, a volunteer movement being at the same time encouraged by the Government. In consequence of the continued excitement in Hungary, the Government have resorted to the extreme step of shutting up the university of Prath for an indefinite time. A report is in circulation that agents of Garibaldi have been discovered taking soundings by night in the lagoons. Certain it is that the lamps have been extinguished in the lighthouse of the Austrian coast, in terms of a new regulation, fortunately not put in force until the Liverpool steamer had arrived at Trieste.

From Central America we learn that General Walker, with 70 of his men, had been captured by troops belonging to Honduras, who, in the boats of the *Jauru*, a British war-steamer, proceeded up the Rio Negro in pursuit of him and his party. The filibusters were in a very desperate condition. Many of them, who were sick, were allowed to return to the United States, on the condition of never again returning to Central America. Walker and Colonel Kodles are, however, condemned to be shot; and late advices state that the sentence has been executed.

The proceedings of the Social Science Association at Glasgow during the past week have received much attention, indicating, as they do, the course of legislation advocated in a large class of important questions by certain promoters of educational and social reform. The proceedings on the second day of meeting were opened with an address from the Lord Advocate, on jurisprudence.

On the same day, Sir J. K. Shuttlesworth read a paper on the "Correlation of Moral and Physical Forces," that is to say, on the compromise which must be come to in legislation between the art of money-making and the laws of morality. The upper classes of the community might, he held, gain for a time by a cruel system of overwork, in which men were treated as mere brute instruments, but they would ultimately lose by the degradation of the population so treated. Sir J. K. Shuttlesworth would have drunkenness suppressed by religious education, a rigorous police, and a stringent enforcement of the Licensed Victuallers' Act; education being his great remedy for the worst of our social evils. Mr. Kinnaird, on the 27th, read a paper on "Punishment and Reformatories." He adopted, to some extent, the views of Sir J. K. Shuttlesworth, but he advocated a different kind of education from that approved of by this gentleman and the Committee of the Privy Council, which he thinks is much too bookish and reconciles for the working classes, and calculated to unfit them for service and the performance of their home duties. He thinks that education should supply the poor with the means of spending their leisure in useful and varied occupations. "Why," he asks, "should not every boy know enough of tailoring, of shoemaking, and of carpentry to enable him, when a man and the father of a family, to make his children's shoes, though he may be a painter by trade; to make the easy-chair for his wife, and even to mend his own coat?" Mr. Kinnaird, to some extent, marred the force of his remarks upon many true and important principles, by proposals to place crowded tenements under penal statutes, to introduce the *Forbes Mackenzie Act* into England, and to enforce the observance of the Sabbath by legislative enactments. Mr. James McClelland contributed a valuable paper upon Education in the United States, from which country he has lately returned from a tour, during which he made the subject of Education his especial study.

The *Monitor* of the 20th ultimo publishes a document of the highest importance, viz., the first part of the new French tariff applicable to English products, embracing metals, machinery, tools and instruments. The extent to which the duties are reduced on all the goods enumerated in the schedule accompanying the Imperial decree, will surprise those unacquainted with the extent to which manufactured articles in iron, steel, and brass were burdened with prohibitory duties by previous regulations, and thereby placed behind the reach of French competitors.

The Prince of Wales, on Friday the 11th, arrived at Niagara, where he saw the Falls, as they have never been seen before, illuminated by the glare of 200 Bengal lights, on which the waters shone as if turned to molten silver. On the following day Mr. Blount executed his most terrific feat, that of crossing the rapids on a tight-rope with a man on his back, a spectacle which it was necessary that the Prince should witness, as the Americans now declare that unless you see "Blondin walk you don't see Niagara." His Royal Highness has now entered the United States. He left Hamilton on the 20th, and arrived at Detroit on the same evening.

MONEY AND COMMERCE.

The price of wheat has risen generally from 5s. to 6s. a quarter, within the last ten days, in consequence of the return of unfavourable weather, and is now higher than at any time since 1856. White wheat now sells for 55s. to 70s. per quarter, and red wheat for 50s. to 65s. The difference of 15s. for wheats in *Mark-lane*, which in some markets amounts to 18s., indicates varying qualities in the crop. It is very unequal. Some wheat has been secured in good condition, and has grown well out, while some is extremely poor. In consequence chiefly of the rise in the price of food, speculation in the Funds and trade generally has been again dull.

From a reported deficiency of the coffee crop to supply the wants of the world, and a reported comparatively short stock of sugar in our possession, we might expect an active condition of the markets; but, under ordinary circumstances, the price of food influences, not to say governs, all other markets. While it is low, and likely to continue low, there is a comparative abundance of means to buy other commodities not so strictly necessary as food, and then there is life and activity in other markets. The *Legislative-General's* weekly returns inform us as to the metropolis, at least; and what is true in respect of it is true of nearly every part of the empire,—that population continually increases. We have no similar assurance that the production of food, and all other useful commodities, are continually increasing in an equal ratio. We believe that it has not so increased, because we know that production, as the rule is, is stimulated by high prices. We say, therefore, if population has really gone ahead of production, anticipate a season of advanced prices, particularly of food. As all other markets depend, in the main, on the food market, and as we know, from much experience, that this cannot be interfered with by the state without causing inexpressible mischief, it ought not to interfere with the production of any other commodity whatever; for the price of it, and the remuneration of the producers, must ultimately depend on the price of food.

We learn by the *Herndon* mail, in accordance with the statement that the supply of coffee is below the demand, that the price of coffee in the Brazil has risen, in consequence of the increased demand from Europe and the United States. The vast increase in the quantity of this article now grown in the island of Ceylon is one of the marvels of modern industry. From producing none, English capital and English energy, aided by native labour, has made it the chief source of our supply. Our increased consumption is more than met by what is grown in Ceylon, and the coffee produced in the other parts of the tropics goes to supply the countries of the continent which have not, like the French and the Dutch, coffee-growing colonies, and yet are great consumers of coffee.

The silver which lately arrived from Mexico has been sold at a reduction of 1d. per ounce. The present price is 61½d. per ounce. This expresses the relative value of silver to gold; thus, the present price, with the fall, indicates that gold is not declining in value, as has for some time been much doubted by all the owners of fixed incomes. Now people begin to see that a general rise of prices, from the gold discoveries, which it was supposed at one time would affect the fortunes of all, is not likely to take place. In fact, when the immense quantity of paper currency now in use is considered, or how small a proportion of the whole currency of the world consists of gold, and how great the quantity of gold—the increase in the quantity of gold, though great in relation to the stock in the world, is, relatively to the general amount of currency, so small that it is not likely to have much effect on prices.

It is stated that the idea of a bill of exchange, promissory note, draft, or other promise to pay, being regarded as cancelling a debt, is here considered preposterous. This is extraordinary, since it is an idea with which the public is continually familiarized by the promise to pay of the Bank of England being in law an actual payment or legal tender. This is not, indeed, a promise of the individual to pay, but the promise of a company, namely, as the guarantee, that the promise will be fulfilled by all the power of the state. Still it is only a promise to pay, which is made in law to be an actual payment.

The public has been rather astonished in the week to see the signatures of two English functionaries with those of two French functionaries to a decree in the *Monitor*, regulating the customs duties on iron imported into France. The strange circumstance is, however, the proper consequence of the treaty of commerce with France, and may perhaps be the first instance of a decree common to both countries affecting the interest of both, inasmuch as if the people were under one government, as they obviously carry on their mutual trade under one common national law.

The principal feature of the change is the substitution of a duty of £2 10s. 10d. on all rolled iron, for the complicated, greater, and discriminatory duty of different kinds of rolled iron, which before existed. It has been received with approbation by our manufacturers. It will tend, though it has not had any immediate effect on our iron market, to increase our manufacture, while it will facilitate the production of useful machines and instruments in France. It is a part of the changes which are to flow from the commercial treaty, and cannot fail to confer benefit on both nations. The duty is to be further reduced 16 per cent. in 1861.

Another failure of no great importance is announced in the leather trade. Money, in consequence of slackened enterprise, continues abundant. The rate of discount is unaltered; but there is no pressure. The Funds, too, stand at about the same figure as last week, but are a little improved. Political events have been considered to be favourable, and a slight improvement in the public Funds has followed. Railway Shares continue firm, and preserve generally their upward tendency. It is satisfactory to see that this vast property maintains its value, and to believe that it is destined to improve. The great work now on the Railways of the United States, and a fair amount of business has been done in them of late in our market. The public are beginning to think that there are no securities which promise larger dividends hereafter, or offer more temptations to capitalists, than the railroads of the United States.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

Those who were so loud and industrious a week ago in announcing—and fomenting—quarrels in Italy between Garibaldi and the King, are compelled to hark back, and once more to take the hopeful view of Italian affairs which has never been abandoned in THE LONDON REVIEW.

Many seem to doubt the co-operation of the Sarlinian army, and to hint at the reluctance of the Government of Turin to occupy protractively the Neapolitan territory. But I am confidently informed that there will be no more hesitation exhibited on this score, and that when the vote of the Parliament is taken at Turin, the Sarlinian troops will enter the Neapolitan territory to maintain order, and that they will be personally commanded by Victor Emmanuel, who will join the forces of Garibaldi, now swollen to 90,000 men, and will assist the vote in favour of Italian Unity, which will be no longer delayed. There is every fair prospect of a great and powerful Italian kingdom, without the interference of foreign Powers. I always said that the Pope would not leave Rome. He can stay there peacefully and happily, if he will confine himself to his spiritual duties, and leave the career of government to the brave King, and the united and intelligent Parliament of Italy.

Whilst the Court and the great officers of state are absent, Lord Palmerston receives daily at his country seat the reports of the several departments, and learns that everything in the United Kingdom goes on smoothly and tranquilly. Ministers will assemble in London early in November, in preparation for the coming Session of Parliament.

There is another unexpected vacancy in the House of Commons. Mr. Dunn, the member for Dartmouth, has died suddenly, on his route to Australia by the Red Sea. As he notoriously brought his way into Dartmouth, the place is considered open to any enterprising dealer, who can adopt safely the same road to success. Mr. Moffatt, who was twice elected for Dartmouth, is gone to Houlton, which he will not desert; and Mr. Lindley sits for Sunderland. As the Derby Government is not now installed at the Admiralty, it cannot use the bribe of sustaining any ship of war of the coast. I believe Mr. Shesley is in London. If so he may regain the seat of which he was deprived by a Committee of the House of Commons. He would make a most respectable member. His wife has just offered her splendid house, near Fittsbrough, to the Prince of Wales,—a fact which ought to give her British husband an additional claim upon the sympathies of his countrymen.

Covent Garden does not fill for the English Opera season. I should be surprised if it did—with old opera, old singers, and everything of a mediocre quality, except the lead, which is only inferior to Coste's. The managers must better themselves if they keep to maintain their reputation.

The rival house at the West-end premises great variety, both in Italian and English Operas. But, with the exception of two or three names of eminence, the companies are composed, for the most part, of very inferior and unknown artists. Unless the land can be improved, Her Majesty's Theatre, I fear, will sink lower than ever below its ancient aristocratic reputation. There is a new staircase in course of construction for the Queen, with increased accommodation of every kind; but the musical department must be improved, ere the management receives any large accession of royal patronage. However, Mr. Smith enters for the million, and they, perhaps, are the best playmates, after all. A very questionable change is made in the audience part of the house. The balcony, first constructed for the promenade concerts, is once more erected. Some room is gained by this; but a great portion of the pit, and of the grand tier and pit tier of private boxes, is destroyed—so that upon a balance of accommodation, there is nothing gained. It is only admitting a more numerous and inferior class.

Singularly good fortune attends the Haymarket Theatre. Mr. Beckstone almost makes his season continuous; and excellent management always finds its reward.

Fitzfall has a striking dramatic piece ready for Astley's. We wish it success. It is one of the very few theatres in London which pays a good price to dramatic authors.

The company at Drury Lane Theatre, which is to open on the 15th of the present month, is strong. Mr. and Mrs. Charles Kean, and Mr. and Mrs. Charles Matthews, Mrs. and Miss Stirling, Mrs. Frank Matthews, Miss Ellen Arden, Mrs. M. Davis, Mr. Robert Rooley, Mr. Lamlert (who has been for years absent in Australia), and other popular artists, are to appear. The ill effect of a "contract," compels Mr. B. Webster to carry another "contract" play, for which he has not room at the Adelphi, to that, properly, which operates as a "house"—Drury Lane. Mr. Webster thus assists Mr. Smith to swell his long list of modern actors at "Old Drury," but he is right, so long as "The Colleen Bawn" continues to draw full houses to the New Adelphi.

The Princess's Theatre is announced to open with a French actor of celebrity, who was the representative, in Paris, of the twin brothers in the well-known high mark. But Mr. Harris has provided one or two sorceries of high mark. But Mr. Harris must stir himself, for there is promise of more than usual rivalry in the forthcoming theatrical campaign.

Mr. Wigan makes no sign since the St. James's beyond what we were able to announce a fortnight back. But his friends are confident in his judgment and ability, and we have no doubt he will make the St. James's Theatre a fashionable and favorite resort.

Mr. Robson keeps on his successful career at the Olympic with as little as possible of novelty, either in his company or in his productions.

Mr. and Mrs. Howard Paul, whose entertainment was so fortunate as to obtain a lengthened London "run" are performing in the large Yorkshire towns with very great success.

MEN OF MARK.—No. IV.

LORD CAMPBELL.

THE King is dead. Long live the King! Lord Chancellor Lyndhurst retired, and is succeeded by Lord Chancellor Brougham. Cottonian, Trevelyan, St. Leonards, Crauworth, Chichester follow, and then comes a venerable figure, who affects a certain republican plainness and severity of attire and demeanour. Years ago he wished to be known as "Plain John." His speech is the rugged Doric of the land of Burns. Nelson could not have worn an air of more staid and sober gravity. His mind never parts off the omnino. Fox used to say that no human being was ever so wise as Thurlow looked. Minerva would accept the present occupant of the mace and seals as her high priest, and, if justice could look from under her fillet, she would not be approvingly at her revered interpreter. If we called Lyndhurst the Pericles and Brougham the Alcibiades of Lord Chancellor, the subject of our present sketch might be, for gravity, if not for wisdom, the Keomest of the group. In such brilliant and dashing company he is like a quaker dressed in homopony and hoddie-gry among the Valkyries of his age. By the side of cotemporary so eminent and so rarely gifted, his peculiar gifts are likely to be undervalued, and to receive scant appreciation. No flashes of genius, no brilliant versatility here dazzle our judgment or extort our wonder. Yet, to speak of him as a more plodding lawyer would be a great mistake. He has that rare good sense, which, in perfection, is another kind of genius. Shrewdness and sagacity, a mild well-bemused and highly balanced, perseverance that can disconcert occasional failure, a happy knowledge of men and things, strong convictions, with a due temperance and moderation in their advocacy and expression, are not gifts and graces so equitably vouchsafed that they need to be displayed. In one respect our lawyer, third and last in order, will be by many esteemed above his great rivals. His political career has been distinguished for an undeviating consistency. While the Tories have reproached Lyndhurst for occasional tergiversation, and while the Liberals have not seldom mourned over the alterations of Brougham, "Plain John" has never swerved from the principles which he avowed at his entrance into public life. The assiduous had a saying, "Call no man foreman till you know the manner of his end." But if there be any faith in politics or politicians, that which our present Lord Chancellor was at the outset of his political career he will be to the end,—a happy and enviable example of public consistency, and of a political faith which posterity will consider wisely chosen and manfully upheld.

Perhaps the proudest and most exciting moment in the career of our legal sage was when he walked up the floor of the House of Commons after gaining the verdict which declared the innocence of his Prime Minister and political patron, and recused the reputation of a woman of beauty and genius from the shafts of calumny. By his singular skill and tact in cross-examination, he had made the lowliest disreputable witnesses, who were to have sworn away a man's honour and a woman's plighted faith, tell the story of their own baseness and untrustworthiness. The skilful and eloquent advocate walked from the Court to St. Stephen's to gain the cheer that greeted his triumph; and richly he deserved his oration. He had not only laid bare a conspiracy—the law served his party. The dangerous wound recoiled upon the heads of those who had used it. The calumny, invented and fostered to serve a political purpose, was followed by a reaction against its authors, editors, and sponsors.

Another proud event in the career of the Whig Attorney-General was his pamphlet setting forth the law upon church-rates. It was a courageous act. No client had paid a hundred guineas for his opinion and then published it; last deliberately, in order to set at rest mischievous and unfounded assertions, the Attorney-General published a statement of the law as it was afterwards substantially affirmed by the House of Lords upon the *Brimley* case. This pamphlet greatly encouraged Liberal Churchmen and Dissenters in their opposition to this vexatious impost, which, if the Church had been wise, would long ago have ceased to create heartburning and ill-will.

"Plain John" was a tower of strength to the Whigs of his day. He was the great Attorney-General of his generation. As a law officer of the Crown he was of the first force—judicious, safe, abiding from to responsibility that rightfully belongs to a lawyer; unassuming, and not cured with a too intense consciousness, like his latest successor in the office. He was, indeed, indispensable to the Whigs. Unless an Attorney-General consents to a restriction upon his privileges on taking office, he can, according to etiquette, enact any law of his office that may fall venial, from a prime judgment to the Chief Justice of the Bench, or the Great Seal. When the subject of our sketch stated that he should like to exchange the turmoil of the Courts for the dignity of the Bench, he was told he could not be spared. When he shrugged his shoulders, and said "*Mais, Monsieur!*" he was asked, like a certain transatlantic celebrity, whether "he would like a tide?" This acknowledgment of his eminent services to his party was freely accorded, and his wife became a baroness in her own right. Yet the fruit plucked from so high a bough threatens to turn to litter asides in the month, for the son has inherited the mother's barony; and unless the old man's signal consistency, his judicial services, and his legislative achievements, are rewarded by a step in the Peerage, he will drop from woodcock to a rank and precedence inferior to that of his son.

As a law reformer he has won laurels scarcely, if at all, inferior to any of his cotemporaries. No newspaper writer will forget the gratitude which his order owes to the legislator who first permitted them to plead *habeas corpus* in the discharge of their functions as public instructors; nor can we omit, even in this brief notice, to bear testimony to the exemplary candour, fairness, and moderation which, as a judge, he displayed on all occasions of prosecutions against the press. Our space will not permit us to detail his share in amending the law of evidence and practice of the Courts, but we must not close in a line the next known by his name, by which railway directors and ship-owners are made responsible to the widow and orphan for deaths caused by their negligence, or the carelessness of *hicks* of their servants. It is now clearer for railway companies to employ a *haver*

pointman, and to pay for a day relay of guards and engine-drivers, than to deprive the doctor's bill, or compensate the families of the victims to their parsimony and bad management.

It used to be said of Dr. Buckland, that he demonstrated the habits of the megalomaniac with mastery, because natural, pantomimic action. When our Lord Chancellor rises to address their lordships, his gestures seem heavy to un-imaginables. He pitches his voice too low for that capacious chamber, forgetting that he is no longer charging juries in the Queen's Bench or in assize courts, and that his voice, to be heard, should be low and sustained. Much of what he says is therefore lost, even by the lordships, which is to be lamented, since all that is heard is cogent and well reasoned. His "Lives of the Chief Justices of England" has taken a high place in legal biography. His "Lives of the Lord Chancellors" it may be hoped, will complete to the date of his death, by leaving behind him his autobiography. Our three lawyers are all self-made men. They owed nothing to rank, fortune, and influential connections; and the young Scotch advocate had to struggle against the disadvantage of his rugged northern speech and somewhat unpublishable exterior. In the annals of self-made men there are few histories more striking or more honorable than that which will chronicle the earnestness, energy, and industry of JOHN LORD CAMPBELL, LORD HIGH CHANCELLOR OF ENGLAND.

We bracketed our three great legal dignitaries together, although want of space prevented us to give their portraits separately—from week to week,—and not collectively, as we intended. A rivalry, half real and half affected, has long existed between them. If Lyndhurst makes a speech on foreign affairs which wins him the greater fame, Brougham congratulates himself on being able to dance a better quadrille, or on carrying off the honours of blind man's buff. If Campbell shoots a hawk, he would miss his chief satisfaction if he did not "make Brougham die of envy." In law reformers they maintain a constant triangular duel. Campbell delights to engage and vanquish Brougham; and when he himself tries his hand, and comes down with a bill, he always finds Lyndhurst "waiting round the corner for him," as the sparrow-hawk, in Sam Weller's story, waited for the robin. In this encounter of legal acumen, the audience, like the Vicar of Wakefield, may not feel sure that there is a great deal of wit, but they can not but feel that there is a great deal in the great deal of wit and laughter among their lordships.

Lyndhurst is eighty-eight, Brougham eighty-two, and Campbell eighty-one. Ought we not to admire no brilliant and remarkable a conjuncture of great planets in our parliamentary horizon with a certain fire and haste, lest, ere we have sufficiently gazed, observed, and compared them, one or other of these luminaries be suddenly withdrawn and quenched in night?

THE SHAKESPEARE IRELAND FORGERIES.

I.—WHAT THE FORGERIES WERE.

THE fabrication, towards the close of the last century, of a mass of documents purporting to be in the handwriting of Shakespeare, and other persons of his time, is an incident in our literary history which recent circumstances have invested with renewed interest. The details concerning it have been carefully examined in an article published in the August number of *Frazer's Magazine*. But the subject is by no means exhausted. Some curious particulars remain yet to be filled in, and some errors, both of statement and conjecture, to be set right. Of our purpose is to digress the materials for the completion of the story of the forgeries, in a short series of papers, touching chiefly on certain portions of the narrative which have not hitherto been sufficiently explored. The new matter will partly consist of memorabilia derived from a personal knowledge of William Henry Ireland, and of Montague Talbot, who detected the forger at his extraordinary labours in his chambers at New Inn. The contents of both, drawn from direct observation, and the origin and progress of the forgeries, as related by them at different times, long after they ceased to hold intercourse with each other, suggest points well worth dwelling upon in the reconsideration of the case. It is also our intention to introduce in these papers fac-similes of the most remarkable of the signatures, real, water-marks, &c. traced or forged by Ireland, so that the reader shall have before him accurate illustrations of the skill with which the fraud was perpetrated, so far at least as the imitation of the Elizabethan handwriting went. These fac-similes are taken from a volume, which we shall presently mention, in a future paper, presented by William Henry Ireland to Montague Talbot, the dramatist, and now in the possession of the Editor of this paper.

It will be necessary, for the sake of clearness, to tell the story of the Forgeries in the first instance; but we will dismiss it in outline, its most material features being already well known. In sifting it, with a view to the marshalling of the facts, as matter of evidence, great difficulties arise from the want of dates. In none of the statements that were published at the period, either by the Irelands, or their supporters or opponents, can we obtain any clue to the exact time when the forgeries originated, or when they first came into the hands of Samuel Ireland, or the earliest dates of their pretended discovery, all of which items are essential to the elucidation of more than one important question raised in the course of the inquiry. We must, therefore, be content with such dates as we have, and such lights as they supply.

It is strange enough that there were two Irelands, who were contemporaries in London towards the end of the eighteenth century, who followed the same pursuits, and who were often mistaken for each other. Both trafficked in prints and pictures, both made large collections of Hogarth's works, and both issued publications bearing the same identical title of "Illustrations of Hogarth." But there were marked differences between the two Irelands. One was John Ireland, the other was Samuel. John Ireland was born in a farmhouse in Shropshire, which had the honour of giving birth to the poet Wycherley. He was brought up by Wycherley's widow, and being left unprotected for at her death, his friends put him to the watchmaking business, in which he had so little success that he turned dealer in prints and pictures, and an avocation which he had a natural inclination, and some talent. This led to his employment upon the works of Hogarth. He is said

to have been a man of strict integrity of character, and of pleasant and inoffensive manners.

Samuel Ireland had a higher ambition than his modest namesake, and his tastes took a more discursive range. He began life in Spitalfields, but soon made his way to the West-end, where he found a ample field for his talents in the compilation of *Illustrated Tour Books*, for which there was a great rage at that time, to which he added the more profitable calling of a speculator in rare books, prints, and drawings. He could draw, engrave, and write, with a certain amount of practical cleverness in each department, but excelling in none. He was an enthusiast in whatever he did, and if he did not always do his work well, he never failed from lack of exertion. In 1790, he published a "Picturesque Tour in Holland, Brabant, and a part of France"; in 1792, "Picturesque Views on the Thames"; in 1793, "Picturesque Views on the Medway"; in 1794, "Graphic Illustrations of Hogarth"; and in 1795, "Picturesque Views of the Severn and its branches, and the English Lake District." He was also the author of a "History of the Inns of Court," a posthumous publication. This list of his works testifies to his industry, and which is more to our purpose, indicates the direction it took. We learn from a publication given to the world upwards of thirty years after his death by his son, that the great passion of his life was unbounded devotion to Shakespeare. Four evenings out of the seven, Shakespeare was read and discussed in Ireland's house after dinner, his son William Henry and his two daughters taking different parts, and reading them aloud, to the infinite delight of their father. Ireland lived in Norfolk-street, off the Strand, where he had an excellent library, and a large collection of prints, drawings, and engravings, especially of the works of Hogarth, which is spoken of in terms of critical admiration.

Surrounded by such associations, and inspired by the constant perusal of the works of Shakespeare, under such suggestive circumstances, we may easily understand, without throwing any doubt on the sincerity of his professions, how young Ireland became impressed with the conviction that he was called upon to do something for his country, and for the benefit of his fellow-creatures. The situation was dangerous to a youth about town, whose lively imagination was evidently in advance of his moral culture; and when his father declared, as he did over and over again in various forms, that he would give him his whole collection of rarities—books, pictures, and all,—for a single evening of his divine Shakespeare, and that he would give him the privilege of reading the plays to the eyes of the son, whose destiny—to use his own peculiar language—these "reiterated eulogies" and "incessant remarks" irretrievably sealed. The crude, irresolute thought which these evenings with Shakespeare at home first dropped darkly into the mind of William Henry, was confirmed into an abase by a journey to Stratford, collected materials for a book upon the Avon. The boy was the companion of the tourist on that occasion, and participated in the frantic orgies with which the elder Ireland appears to have closed each day's gathering of "legendary tales" and "traditional accounts." From morning till night nothing was talked of but Shakespeare. "In short," says William Henry the name of Shakespeare ushered in the dawn, and a bumper, quaffed to his immortal memory at night, sealed up our weary eyes in repose."

It was early in the year 1795 (we confine ourselves at present to the public production of the forgeries, reserving for a separate paper the singular drama of their fabrication) that Samuel Ireland announced to the wondering world of literature—which boasted of the most famous Shakespearean commentators that had at that time appeared upon the scene, including Malone, Steevens, Farmer, Prynne, Ritson, Doane—the discovery of numerous MSS., large portions of which he had discovered in the handwriting of the great dramatist. Of these MSS. it was stated that they brought to light not only new facts in the life of the poet, but new works from his pen, which had never been heard of before. The effect this announcement produced on the literary circles was much the same as if a bombshell had suddenly exploded among them, and the world had been shaken to its centre. He exhibited his precious relics freely to the public, at his house in Norfolk-street. He made no attempt to set a fictitious value upon them, or to support their authenticity by an ingenious story. In fact he had no story to tell. There they were, to speak for themselves. Their authenticity rested upon the internal evidence. His own raptures about them knew no bounds; but he declined to enter into particulars, answering all questions by a general assertion that he was bound to secrecy. This was honest enough, although he could hardly have taken any course more likely to excite suspicion.

Opinions were divided, upon the inspection of the papers. Some names of note were on the side of authentication, but the number of the critics, and, if we may judge from the tone of the controversy in the periodicals, the bulk of the public, were on the other side. In the midst of the upsurge, Samuel Ireland issued proposals for the publication of his treasures. At first, the only account given of the contents of the MSS. was that they were in his hands, and that he had fallen to him; but he afterwards became more explicit, and stated that he had received them from his son, who had obtained them from a gentleman, the possessor of a large valuable library, who imposed upon him a solemn condition of secrecy. The shifting of the responsibility from one to another, until it disappeared in an anonymous group, will recall the manner in which Moses is obliged to borrow money through a friend in the city, who is obliged to go to somebody else for it, the discount increasing at each remove. Public curiosity, however, was stimulated rather than abated by the impediments that were thrown in the way of the disclosure, and when the promised publication came out in 1796, with great pomp and splendour, in a noble folio volume, issued by subscription at four guineas, the interest it excited was universal and intense. The following is the full title of the work:—"Miscellaneous Papers and Legal Instruments under the Hand and Seal of William Henry Ireland, including the Tragedy of 'King Lear,' and a small Fragment of 'Hamlet,' from the original MSS."

The reader of the present day, who has never had access to any of the original publications connected with this memorable fraud, can form no adequate conception of the extent of the fabrications, or, even if he does, of the ingenuity, industry, and boldness they displayed. A catalogue of the papers exhibited by Mr. Samuel Ireland is no ordinary curiosity in itself. The tragedy of "Vortigern," which came at a later date upon the stage, the "Confession of Faith," the "Letter to Anna Hatheway,"

* A copy of Part II. afterwards brought as much as £20. 8s. Lovers say that there are only two copies extant.

enclosing a lock of Shakespeare's hair, a letter from the Earl of Southampton, and, perhaps, one or two more letters, comprise the whole of the forgeries that are now known, and known chiefly by their titles alone, to the reading public. But the genuineness of the fabricator was far more comprehensive, and involved a much larger area, as will be seen by the following list of the papers, in which we have not included either of the plays forged in Shakespeare's name. Only some of these were published in the grand folio volume; and we are not aware that, except in fac-similes, any of the remainder have escaped into print.

Shakespeare's Autograph.

Quarto Mitchell's Letter to him.

Four Miscellaneous Papers.

A Letter to Anna Hatheway (whom Shakespeare afterwards married), enclosing

A lock of his hair.

A Copy of Verses on the same.

A Copy of Shakespeare's Letter to the Earl of Southampton.

The Earl's Answer to the same.

Shakespeare's Profession of his Faith.

A Letter to Richard Groun.

A Pen-Drawing or Sketch of Shakespeare, by himself, with his Arms and Crest, with two Signatures of his Name.

The Reverse, with his Initials, &c.

A Duet of Gift to William Henry Ireland, with his Signature and Seal reversely attested. In which he gives to the said Ireland several plays, and ten pounds for a ring, in testimony of gratitude towards him, for having, at the request of his own life, saved that of Shakespeare, when drowning in the river Thames.

Tertiary lines to the said Ireland, with the Arms of Ireland and those of Shakespeare linked together by a chain, rudely sketched by himself.

A Pen-Sketch of Ireland's House in Black Friars.

Another Pen-Sketch of the Arms of Shakespeare and Ireland, and two Signatures of Shakespeare.

Shakespeare himself, as it is imagined, in the character of Hamlet, a whole-length

Tinted Drawing; on which are his Arms, and, on each side, the Names of several of his Plays, and the Initials of his Name.

The Reverse of the above, a Drawing, in the same manner as above, of Shylock.

An Agreement with John Lowin, with Shakespeare's and Lowin's Names and

Seals, duly attested.

Another agreement with Henry Condiell, with Attestations as above.

A Lease from Shakespeare to Michael Fraser, and Elizabeth his Wife, with Attestations as above.

A Duet of Trust from Shakespeare to John Henegay, an eminent Lawyer at that time, and afterwards the Manager of the Players in the State Paper Office, sink into insignificance. Here is, at least, an amount of cleverness in design and execution of which it is impossible not to regret the misapplication.

Indeed, the versatility displayed in these instruments and autographs is so remarkable, that the most surprising oversight, as it appears to us, committed by the critics who examined them, was to have overlooked the fraud in the number and variety of the documents laid before them. Had they opened the investigation from that point of view, they must have infallibly arrived at the conclusion that the sponsor of the papers had proved too much.

To this catalogue must be added the tragedy of "Vortigern," produced at Drury Lane Theatre, in the month of April, 1726, and based on the fraud, partly through the exertions of Malone, who warned the audience in a hand-bill that the whole of the pretended documents were forgeries; and partly through the silent resolution of Keble, who played the chief part, to effect the destruction of the piece, by showing that he held the same opinion. Good, kind, pious Mrs. Jordan, who was a firm believer in the authenticity of the play, just as she would have been a firm believer in the generous and trusting side of any question, did her best to save the piece, but in vain. The performances ended in an uproar, which was scarcely appeased by the reappearance of Mrs. Jordan, to speak a spiritually but dangerous epilogue, written for the occasion by Mr. Merry. She was listened to for her own sake; but the moment she left the stage the riot was resumed, and the play, thus effectually annihilated, was never produced again. Mr. Sheridan was indignant at Keble's conduct, and told him, in the green-room, that his private opinion led nothing to do with his business as an actor, that he had been there as a servant of the theatre, and that it was his duty to exert himself to ensure the success of plays, and not to damn them.

Nor was "Vortigern" the only play announced by the owner of these productions. Mr. Ireland informed the public that he possessed another and a better piece, in the handwriting of Shakespeare, which he promised shortly to produce. The fate of "Vortigern," however, seems to have diverted him from his intention. This play was an historical drama, called "Henry II.," which was advertised for publication thirty-six years afterwards by William Henry Ireland, in his last reprint of "Vortigern."

But more daring than these fabrications was a statement put forward by Samuel Ireland, that he had in his possession a number of books which contained marginal notes in the handwriting of Shakespeare, and which were supposed to have formed a part of Shakespeare's library; in confirmation of which he produced a catalogue, in the same handwriting as the other Shakespearean papers, in which the titles of upwards of ten hundred volumes. That this circumstantial attempt at imposition did not at once strike the scholars who resided to Norfolk-street as almost as marvellous as the fraud itself; but nobody seems to have laid any stress upon such points. Everyone was willing to accept the papers as he found them, and to test their authenticity solely by the internal evidence. Even the unscrupulous deed of forgery by which Shakespeare was made to bestow several of his plays, and two pounds for a ring, upon *William Henry Ireland*, for having saved him from drowning, did not excite him so much as the question of orthography.

It was felt on all hands that the reluctant spelling was suspicious. Malone came out upon this point with great force. A correspondent of the *Gentleman's Magazine* justly described the orthography as being "blotted throughout with unmeaning letters;" and another writer, in a pretended letter to Malone, gave a highly humorous imitation of it, of which the fol-

lowing is a sample:—"Iste fityes thee too unmederstande that the verretuose epyrtine offe three deparetedde William Shakespeare offe Stratford upon Avon offe offrudibleme lyf anothere counterfeytynge Wyllye fromme Iaxaxa lyf Thamus." The application of this principle of blotting out words by superfluous letters to the name of Ann Hathaway, drew down the special ire of Malone, who declared that, although he had examined thousands of old English deeds, he had never seen the name spelt *Ana*; and that the addition of the final *a* to the repetition of *end*, invariably adopted in these MSS., was utterly unknown to the age of Elizabeth, as, indeed, was the whole orthography, and much of the diction.

Hostile criticisms, charges of fraud, and angry demands for explanations, accumulated upon the head of Samuel Ireland. His house was beginning to be too hot to hold him; and the impatience of William, who was now equally as accurate as his father, was summoned to give evidence. Alarm, or shame, set in at last; and the confidence which had, up to this time, out-faced all interrogatories, now broke down. The young man made a full confession of the whole fraud, and fled from his father's house, which he never entered again.

This disclosure marked the character of Samuel Ireland, who was suspected by many persons then living to have been *peripetous crinatus*. He fell at once from the position he had previously held in the literary and artistic circles; and although he evinced much courage and consistency under very trying circumstances, he could not live down the discredit that settled upon his name. Even John Ireland thought it necessary to disown all connection with him, and took care to let the public know, in the third volume of his "Illustrations of Hogarth," that there was no relationship or intercourse of any kind between them.

Samuel Ireland did not long survive a disgrace which undoubtedly contributed to shorten his life. He died in July, 1804.

SKETCHES FROM HUNGARY.—No. II.

[FROM OUR OWN CORRESPONDENT.]

ONE of the most important and agreeable discoveries which we made during our rambles in Hungary was the summer. This year it has been difficult to find a fine day in any part of Europe. We came upon a whole cluster of them together; and just when we stood most in need of cloudless skies and glorious sunshine, we were favoured to our heart's content. It was a bright clear morning when we left Szatmar, a little after sunrise, and our four horses made pleasant music on the hard road as we clattered along; still, for the most part, across wide rolling plains, now dipping into valleys where the streams were fringed with willow, and where rose occasionally a church tower, to mark the site of a village, now rising to the brow of a bare hill, from whence we could see over the undulating prairie for a vast distance in every direction, and distinguish mountain ranges scarcely visible in the blue haze. Fast-rising fields of Indian corn were still the predominant feature in the cultivation; and the golden ears of the ears of the gorgeous sunflowers, at this time of year in full bloom; overtopping the heads of the stalks of the maize, with faces all turned to the rising orb, they bowed their heads like a congregation of worshipping Zoroastrians in their adoration of the god of day. Occasionally we passed vineyards, more often the plough, and at intervals, and at intervals, and at intervals, we passed a stunted oak, celebrated throughout the country for containing quantities of wild boar, and which surrounded the small town of Westprim, where we decided to rest during the noonday heat. We had scarce entered the small hotel when our ears were saluted by the din of voices singing, in stentorian strain, the stanzas of a song. We found a general party collected at the door of a large room, temporarily fitted up as a theatre, from whence these sounds proceeded, and on entering perceived a fine-looking man with a pipe in his mouth, walking, with a *disregard* air, in front of the small stage; occasionally he removed his pipe, in a semi-theatrical manner, from his mouth, and raised his voice to its utmost pitch, when he was immediately joined by a rather plain young woman, sitting in a corner farming herself. Both these personages possessed very powerful voices, and when they had executed a difficult measure together, the gentleman went on smoking and walking about the room, and the lady hummed a little air by herself. The proceedings of this pair, until we discovered that she was the *prima donna* of a company of strolling players, and he the *jeune premier*, struck us as singular; but presently the group at the door came dropping in, and with the assistance of a chair, popped upon the primitive stage, where they placed themselves on their knees, and we perceived that they were to utter a few lines of the performances which were destined in the evening to charm the community of Westprim. The piece was apparently a Hungarian opera, but the actors confined themselves to those choruses about which their proficiency was doubtful, so that we had no opportunity of becoming acquainted with the plot. The Hungarian voices were somewhat hoarse and raspy, but the music was pleasant to listen to, and contained some fine passages.

We dined off wild boar, and made a little exploration of the town, which is situated on two sides of a river, and contains a minaret, now used as a fire alarm, a remnant of the former occupation of the town by the Turks.

In two hours after leaving Westprim we reached the brow of a hill, and found ourselves looking down upon the vast expanse of the Platten See, glittering in the afternoon sun. Vineyards clothe the hill sides, which slope gently down to its margin; villages nestle at their base, and a clump of woods on the lake shore, and two or three large substantial buildings, indicate the position of the baths of Furdau, which we regard with complacency as our journey's end.

A promenade, shaded by small trees, with a statue of Kisdalud, the Hungarian poet at one end; the mineral spring, contained in a sort of little temple at the other a band-stand in the middle, and benches everywhere, in the middle of the lake, on one side, and on the other three by hotel, and shops, and the bathing establishments. The baths of Furdau had served as an object for our journey, but the name had conveyed no very definite idea of what we were to expect in the shape of a watering-place in this secluded corner of Europe. We were therefore agreeably surprised, not only by the beauty of the situation, but by the extent of the establishment which it possessed.

We made immediate acquaintance with the warm mineral baths, not for medicinal, but for additional purposes, and afterwards inspected the arrangements of the establishment generally. In some of the compartments

were douches and other hydropathic appliances; others were set apart for the poor people of both sexes; but although there were three or four rooms which would have afforded every facility for separation, they all lashed indelicately together, with very little more to cover them than if they had been Japanese.

The season at Fúrad is nearly over in the beginning of September; and when we visited it there were only a few last remnants of the summer left. They thought they deserved to be so considered when they made their appearance on the promenade in the evening. Their light, graceful forms, seen to the utmost advantage in the national costume, their flowing veils and human-like perisols flung gracefully over one shoulder, added a peculiar piquancy to their natural charms. The characteristic of the Magyar race is to be found in their erect yet supple figures, their small and beautifully-formed hands and feet, and Caucasian profile. Their easy, but courteous manners, genial hospitality, and invariable politeness to strangers, renders exploration in Hungary a most agreeable occupation; and I subsequently found no difficulty in travelling in any direction, parts of the country where public conveyances did not exist. Indeed, we no sooner reached Fúrad than we found that these were not to be depended upon; for the first piece of intelligence which we received was to the effect that the steamer in which we had calculated upon proceeding to the end of the lake had ceased to run. We were relieved from our embarrassment in this respect by an acquaintance whom we were so fortunate as to make at Fúrad, and we decided, at his instance, to take on our vehicle to the country house of a friend, to whom he introduced us, at the other end of the "see." Meantime, we employed the moonlight hours by boating upon the lake, and in tracing the indistinct outline of the old manor, the character of the Magyar race of Thiansy. The Thiansy is the sight of Fúrad. To our shame be it said, that we did not visit it; but future travellers, who are more enterprising, will find there a tiny lake, which is said to be the exact counterpart of the Platten See itself, a wonderful echo, a magnificent view, and a number of old monks, who are very evil to strange women. The early morning is also a time when the patients at a watering-place, and although Fúrad was nearly empty, there were groups of persons collected at seven round the little temple which contained the spring, and the little temple where sheep's milk was served out to those who were unacquainted with the milk. It is taken warm, and possesses a slight green tinge, which gives it a suspicious appearance; nor does the taste, which is peculiarly rapid, belie its aspect. This cure is said to be peculiarly efficacious in cases of consumption.

The waters of the lake are slightly mineral, and contain principally iron. On its margin comfortable bath-houses are erected, and an early swim in the warm soft water was a most refreshing preparation for a continuation of our travels. During the season there is perpetual music at Fúrad; but while we were there, the only band consisted of gipsies, who were, however, indefatigable musicians; nor were we ever tired of listening to the national airs, which seemed a strange contrast to the lofty pretensions of Thiansy. The gipsies, and the wonderful expression of melancholy which seems to pervade them, but by degrees the influence which they exercise upon the native begins to steal over the stranger, and he soon finds himself hanging as fondly upon the tones as if he had listened to them in childhood.

We had scarcely departed a day to Fúrad, and now left it with a feeling of regret, and a certain consciousness of having done it an injustice by hurrying so rapidly away. It had been such a charming break in our journey, the more acceptable because so little expected. There was a repose and tranquillity about it which was relieved from dullness by the little society which had collected there, while the morning was ever pleasant to open. In front, the broad placid surface of the lake in one direction, showing a watery horizon; in the other, its waters divided by the precipitous Thiansy; while behind arose vine-clad hills, with white cottages dotted about the slopes, and gleaming out of the green foliage. Our road lay along the base of the hills, and, after passing through small villages—for the country here is well populated,—we left the shores of the lake, and entered a more mountainous and picturesque district. Volcanic conical mountains, crowned with the ruins of ancient fortresses, rose abruptly from the broken country at their base, their sides sometimes crowned and precipitous, at others clothed with vineyards. In the fields the country people were taking in their crops, and in the villages treading out the grain with horses, who, in circular phalanxes, were wading knee-deep in the corn. We had some difficulty in finding the road to our destination, which was situated near the lake, to which we returned across the country, always through pretty scenery, and hence the shadow of the romantic ruins of an old castle, enclosed in trees, the new chateau of the proprietor, and we were welcomed with true Hungarian hospitality by its noble occupant.

RURAL ECONOMICS.

PROPRIETARY RIGHTS—AGRICULTURAL PERSECUTION.

The relative rights and duties of landowner and tenant-farmer are precise, simple, and easily defined. The landowner has land which, to be made productive, must be cultivated. Capital, labour, and skill, in some proportion or other, are necessary to effect that cultivation, and by the act of seeking a tenant to occupy his land, the landowner admits that he is unable or unwilling himself to apply such capital, labour, and skill to his land as would render it of any use to him. He is a simple commercial transaction on both sides. The tenant-farmer possesses capital, labour, and skill, wherever he is willing to cultivate the land and make it productive. For that purpose he is willing to give a portion of the produce so obtained to the landowner as his share in way of compensation for the use of his land. The landowner's estate constitutes his rent. This is a simple commercial transaction on both sides. Neither party is under the slightest obligation to the other, save the legal obligations of paying the rent on the one side, and protecting the tenant's possession of the land against adverse claimants on the other. What portion of the produce obtained from the land goes to the landowner as rent depends upon the actual state of competition amongst farmers for the land. That competition will always secure to the landowner all the produce raised under the ordinary circumstances of the locality, which will remain after replacing the tenant-farmer's capital, with such interest and remuneration for his labour and skill as the existing competition may permit him to retain.

In the simple case of a landowner having a vacant farm, he may, if he pleases, insist on other conditions than payment of rent and rational management of the land. He may decline to let his farm to any person unless his hair is of a particular colour, or his height reaches a defined standard, or he will bind himself to wear red, blue, or yellow clothing. Indeed, he may insist on any capricious or ridiculous condition as the qualification for occupying the land. No sane landowner would insist on any conditions as we have suggested. But there are landowners, not reputed to be insane, who require their tenants, besides paying rent and duly cultivating their land, to hold—or profess—a particular political or religious opinion, a requirement not less ridiculous, though occasionally more mischievous, than caprices which have reference solely to the stature, complexion, or physiognomy of a tenant-farmer.

The absurdity of a landowner thus acting is palpable. He limits the field of competition for his land by insisting on something totally irrelevant to the contract proposed to be entered into; and, moreover, by such an exhibition of caprice, he drives from his farms many persons of energy and capital, who naturally decline to have any business engagements with a person so obviously deficient in business intelligence. Still, if a landowner insists on a silly and irrelevant condition when he lets his farm, and the tenant, with his eyes open and his hands free, chooses to hire the farm subject to that condition, there is nothing to be said but that two persons not very wise or prudent have come together.

The ordinary position of the landowners of this country is, however, far from being so simple as that we have suggested. Either they let their farms on leases, as in Scotland, for long terms of years, and on engagements involving large and cheap permanent outlays on the part of the tenant; or they let their farms on precarious conditions that cannot be thought of; or they own properties on which bodies of tenants have gone on for long series of years as yearly tenants, under the implied, and often expressed condition that, so long as their rents were regularly paid and their farms properly cultivated they would not be turned off; or they let their farms on leases for a term of years, as yearly tenants; it is indefensible. But it exists widely, and its existence is possible solely because, as a rule, landowners do act up to the implied condition that, rent being paid and the land being managed in the ordinary way, their tenants shall go on with their farms for an indefinite number of years without disturbance or eviction.

This is particularly the case with estates on which the farms are small, where the tenants have no great amount of capital or enterprise, such as are most Welsh properties. There, probably, the same families have occupied the same farms for generations, and though only as yearly tenants, they have considered themselves to be as certainly and permanently settled in their holdings as if they held under leases. Indeed, it is the boast of the landowners that yearly holdings are as secure as leasehold tenures, and often more permanent; and where the occupiers have neither the wish nor the means to improve their farms, they may be as sure as death in this boast. A relinquisher of leasehold tenants, who have paid their rents and farmed according to their lights, often forms a considerable obstacle to the improvement of landed property. To turn out an old tenant, even when the object is the legitimate one of improving the property, commonly excited no little odium in a rural district, and the landowners are willing to encounter. But when tenants are capriciously turned out of their farms, when a proprietor suddenly imposes some irrelevant condition—one which has nothing whatever to do with farming—an outrage is committed on the moral sense of the community which landowners would do well to avoid. And when such caprice assumes the form of a political persecution, it deserves and will receive the severest public reprobation.

A case of this sort has occurred in Cardiganshire. The Welsh farmers are usually men of strong religious feelings, and they are for the most part dissenters from the Church of England. For the owner of a Welsh estate, occupied as it would be by dissenting tenant-farmers, suddenly to insist that all his tenants should attend the parish church, would be an act as wicked as it is capricious. Yet this seems to have been done by a Miss Mary Morice, the owner of an estate in Cardiganshire. In a circular letter to her tenants, which betrays a lamentable bigotry and want of Christian feeling, she says:

"I feel myself bound to let you know that you have two alternatives, and you are at liberty to choose for yourself, namely, either to attend our church services, with your family, and thus to support its principles, or otherwise, if your consciences will not allow you to comply with my request, you must quit the farm which you occupy, and find some other means of subsistence. I am sure you will make use of the advantages which you derive from your connection with my property as a tenant, to the support of those principles which are at variance and hostile to those of your landlady."

Assuming this lady to be sane, her letter is worthy of the dark ages. Comment upon it is superfluous. To read it is to condemn it. We should, however, scarcely have supposed this silly lady to be responsible for her actions, had not her letter been republished and defended by a writer in the *Cardaracha Journal*, signing himself "Clericus," and being, therefore, we suppose, a clergyman.

One passage from "Clericus," in justification of poor Miss Morice's persecution of her tenants, will show the unchristianous advisers the landowners have, in some at least, of the clergy. He says—

"It is to be hoped better times are at hand, when our landowners will see and feel the necessity of taking this bold step, which has already been taken by Miss Morice, in opposition to the usuals, and in order to put an end, in a great measure at any rate, to the most violent attacks which are made by these creatures against our beloved Church."

Undoubtedly Miss Morice's step is a "bold" one, not very likely to make the Church beloved amongst the Welsh farmers. May not it be "boldness" that of certain persons who are said to rush in "where angels fear to tread"? What odd notions of the relations of landlord and tenant-farmer must "Clericus" have, when he writes—

"How absurd and inconsistent it is for a Church person to allow his tenant to rail most bitterly against the Church he loves?"

Probably much wild, such puerile fanaticism will not much help the Church, whatever effect it may have on the hastydom of Cardiganshire. Of course it

dexterous manipulation, and from tricks with which clever conjurers puzzle the most acute—

"Dogs that bark when they are dead,
Are very curious dogs indeed!"

And spirits that ply for individual profit, and tables that waltz, and spectre hands that feel their way and make their mark, are but chimeras and unreal mockeries—

"For what's impossible can't be,
And never, never comes to pass."

THE BRITISH CITY OF THE DEAD.

By THOMAS WRIGHT, F.S.A.

We think we may justly say that few events in this country have excited a greater and more lasting interest than the excavations which have been carried on during the past year and the present at Wroxeter, near Shrewsbury, and which have brought to light a part of the remains of the ancient Roman city of Uriconium, buried during many centuries under the surface of fertile fields. It is situated on the eastern bank of the Severn, at a spot where the river runs for a short space nearly from north to south, and occupies a very extensive site on an elevated position overlooking the vale of Shrewsbury. The success which has hitherto attended this undertaking gives us every reason for expecting that its continuation will throw new and great light on the history of our island during a remote and obscure, and at the same time very important period, and on the condition of the people. We regret that the work is just now on the point of being interrupted by the temporary (for we can only look upon it as likely to be temporary) want of funds, and it is, perhaps, a good opportunity for giving our readers some account of what has been already done, adding that, in spite of the interruption of the works, the ruins already uncovered will still remain open to the public.

Our space will not allow us to enter into any questions connected with the history of the Roman city, or the cause or manner of its destruction, or to give any account of the progress of the excavations. It will be sufficient to say that Uriconium was evidently a place of great importance during the Roman period; it was one of the largest and one of the earliest of the Roman cities in this island. The wall of defence which inclosed it may still be traced by a continuous mound which covers its remains, and this is between three and four miles in extent, forming a very irregular oval. This great city had been taken, plundered, and burnt at the time when the Roman province was desolated by the inroads of the barbarians, and left in ruins and without inhabitants. In this state it was gradually buried by accumulation of earth, mud, at a later period, all that remained aboveground was cleared away for material for building; but the buried portion remained, and was buried still a little deeper by a subsequent accumulation of earth on the surface. It is thus that the lower parts of the buildings only are found underground, but the walls are some of them of considerable height, and in some parts the excavators have had to dig to a depth of thirteen or fourteen feet to come to the foundations.

The accompanying plan will enable us to explain the result of the excavations down to the present time. They were commenced nearly in the centre of the site of the ancient city, and on nearly its highest ground, and it was consequently expected that public buildings would be found. In this the excavators were not disappointed. At first a large building was traced, consisting of a long central inclosure, with a narrow gallery or passage on each side. It is marked in our plan with the letter A, and its extent will be understood when we state that it is 226 feet long, that the central apartment is 30 feet wide, that the southern gallery is 14 feet wide, and that the northern gallery is 14 feet wide at the western end and 16 at the eastern, which has thrown the whole building rather out of square. In this northern gallery were found the remains of a beautiful tessellated pavement, which had extended through its whole length. The central apartment was paved with small bricks, set in what is technically called hebring-bone work. In the middle of the northern wall there is a considerable space where no wall can be traced, and where there may possibly have been an entrance gateway. In tracing the ground to the north, the workmen came in several places to the pavement of the middle of a street, so that this northern wall of the building just described, which was traced far beyond it to the east, bordered on a street

running nearly east and west. There appeared to have been a rather wide space, with a smooth surface of concrete, between the line of buildings and the pavement in the middle of the street. The grand entrance into the central apartment was evidently at its western end, where remains were found which indicated a considerable degree of architectural ornament. Thus it became clear that this building had formed the corner of two streets, running at right angles to each other. At its eastern end was a doorway in the wall, or in the plan, approached by a step, and leading into an inclosure *a*, which appeared to have been a court. In the southern wall were two similar doorways, also approached by steps, *b* and *c*, in the latter of which the step was much worn by the feet of those who had passed over it. Each step was formed of a large square block of stone. Various circumstances which cannot be detailed here, leave little doubt that this great building was the *basilica* of Uriconium, answering to our town-hall, and used for a variety of public purposes.

The excavators proceeded southward through the doorway, *b*, and soon came upon the great room, *d*, which had a hypocaust, or apartment underneath for heating it with hot air. A series of other apartments were opened one after another, *p*, *m*, *n*, *u*, and a comparison of them left no doubt that they belonged to an establishment of public baths. This building has since been more extensively explored. A series of rooms, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*, *j*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, on the north of the basilica, at the western end of which some buildings, E, have been opened, which stood on its southern side. The line of buildings formed by the western front of the basilica, the buildings F and D, and the market, evidently formed the side of a street or open place, the site of which is now partly occupied by a modern road, known by the name of the Watling-street road. The ledges on each side of this road are marked in the plan by dotted lines, G being the gate leading into the excavations. By a reference to the plan it will be seen that the buildings at E advance much beyond the line of buildings just described, and that there was here a much narrower street running southward, at the side of which was a deep gutter, A, A, constructed of stone, and remarkably well preserved. From this and other circumstances, it may be concluded that the line of buildings we have been describing looked upon an open space very much wider than one of the ordinary streets. This, there can now be little doubt, was the forum of Uricinium. A few years ago, in excavating for the foundations of farm-buildings which have since been erected, a row of ten square pillars was found at x, which had evidently not supported any building. These probably belonged to one side of the inclosure of the forum, and will be understood by a comparison of the forum of Pompeii.

It will thus be seen that we have fallen among some of the principal public buildings of the Roman city, forming a square, bounded by streets running at right angles to each other, and looking on one side upon the forum. The ground for some distance eastward was trenched, but no remains of buildings were met with, so that perhaps it was the site of gardens attached to the baths. In clearing out the buildings, the excavators met with the remains of men, women, and children, the infants of the Roman city, who had been massacred when it was taken, and a great variety of objects which had been dropped and scattered about when it was plundered. These latter are all deposited in a museum at Shrewsbury, and are already sufficiently numerous to throw great light on the manners and condition of the people of Uricinium. In consequence of some local difficulties at the beginning of these interesting researches, the basilica was but imperfectly explored, and is covered up again; but, by the liberality of the proprietor of the ground, the Duke of Cleveland, the rest of the excavations, to the extent of the ground occupied by the present basilica, and the monument of great importance, and unique in this country. The excavations have hitherto been carried on by means of public subscriptions; but it is to be regretted they are likely to be interrupted through want of funds. They have now so evidently become a work of national importance, that the Government of the country ought to interfere, and grant the necessary money for carrying them out effectively. An appeal has been made, but the Lord Commissioners of the Treasury have refused to listen to it, on the ground that they object to spending the public money on an undertaking of this kind. Yet money has been granted for excavations in various parts of the East, as well as on the Roman ruins, and surely it might be found for a work of at least equal interest to us at home.

POPULAR SCIENCE.

THE ATLANTIC SUBMARINE TELEGRAPH.

Or all modern undertakings, there is none—not even the *Great Eastern* steamship—which is at once so deeply interesting to the mass of science, and so important to the state, as the Atlantic submarine telegraph. It seems to have nearly a success, but hitherto so completely a failure—to convey messages across the Atlantic by means of a submerged electric telegraph cable. Our readers will remember the history of the expedition which conveyed and deposited the required length of cable between Valentia and Newfoundland, in such a state as to transmit messages, but at the same time so imperfect as to become gradually and rapidly incapable of performing its task. It is of course not easy to decide, in a case where so many reasons for failure might be offered, to which of all of them the actual failure was due; but a few very important and somewhat unexpected difficulties were brought into notice, any of which would seriously interfere with success.

One of these certainly is the singular sluggishness of the electric current through a submarine cable, and the necessity of regarding the cable as an elongated Leyden jar for all electric purposes. It is supposed that, even if no other cause existed, this alone would have prevented the line actually laid down from fully answering its end, in a commercial sense. Other causes, such as the fracture and destruction of the metallic core and its sheath were due to the tendency of the whole cable to coil, and on being straightened, to come into a kink, or doubling back of part. The nature of this difficulty will be easily understood, if the current, which will flow through the cable, stretches a piece of wire or coil of rope of any kind. Now, the slightest fracture in the wire through which the current passes must cause the occurrence of a spark and development of heat; and each time the spark is caused, the broken ends of the wire, being heated, tend to melt, the heat becoming greater as the intensity increases, till at last the current can pass at all, and communication is permanently broken. Notwithstanding, therefore, the partial success of the trial, the probability of placing along the bottom of the Atlantic a telegraph cable that should rapidly, and without injury to itself, convey messages between Europe and America, is decidedly not strengthened.

But besides mechanical causes, another not unknown, but not sufficiently considered difficulty, also became strikingly apparent during the short period of the working of the line between Europe and America. It appears that long lines of conductive wire, placed in high latitudes almost on a parallel with the earth's equator, are singularly liable to disturbance from magnetic storms, and that the current passing through them, from the regular state of terrestrial magnetism, at such times, is quite sufficient to render the regular communication of signals impossible, and perhaps sometimes to melt the wire.

These difficulties—many of them very grave—suggested to some of the parties interested the advisability of avoiding the great distance between the stations, and the annoyance from magnetic storms, by carrying the cable either southward, by the Azores and Brazil, or northward, by Iceland, Greenland, and Labrador. The condition of the sea bottom is believed to be not unfavourable for the former scheme, but the distance to be traversed is enormous; and in the early part of the present summer a strong representa-

tion was made to our Government, to organize an expedition to determine how far a cable could safely be laid along the latter or northern course. The suggestion was immediately accepted to, and H.M. steamship *Bulldog*, commanded by Captain Sir Frederick McIntock, R.N., who had just returned from his memorable expedition in search of Sir John Franklin's party, and had been ordered to proceed by the present Admiralty to Greenland, taking frequent and careful soundings, and then to continue the soundings between Greenland and Labrador. The *Bulldog* started before the end of June, and was shortly followed by the *For* steamer, commanded by Captain Young. The latter expedition, however, was private, and at the close of the parties in the present month of August, the *Bulldog* returned.

It is only within a few days that any news of interest has reached England on the subject of either of these expeditions; and we hasten to lay out-line of it before our readers.

The *Bulldog* made her way without meeting with any difficulties till within a few hours of the coast of Greenland. A few soundings were taken, but up to that point there were no important undulations of the sea bottom. There, however, the depth was found to diminish at once from 900 to 200 fathoms. We proceed with an account of the expedition in the words of an officer who accompanied it for the purpose of investigating the Marine Zoology of the North Atlantic seas.

"We sighted the east coast, below Cape Belle, on the 18th July, and it was our first really fine day since leaving Spitzberg. The entire coast line for thirty miles out to sea was one close-packed field of ice. We were at once unsheltered in amongst the great features of the Arctic regions, and from that date to the 17th of the following month had to do battle with ice just as fiercely as if we were in the West Indies. The ice was of the most dangerous kind, and we wished to make was attempted a dozen times unsuccessfully. Gale after gale lashed us about, and we were all but run out of fuel, when we fortunately fell in with our coaling vessel, and managed to take in coal at Godthaab. The passage into the straits was very dangerous, and the ice was much more than intended; and the Godthaab people say such a season has not been nearly equalled for thirty years."

From this point the survey was continued across to Sydney (Cape Breton).

"Our soundings from Cape Farewell to Labrador were quite satisfactory, with the exception that we failed to meet with the deep channel said by the promoters of the North Atlantic line to extend from the entrance to Hamilton's Inlet well out to sea, and to be protected to the northward by a bank or reef. The inlet itself is a subtle one. We ascended and surveyed it to its north-western extremity, where two rivers flow into it from the interior. The scenery is grand, but grand only in its lack of comparative danger. Along the lower third of the descent, the high hills slopes are entirely level and vegetation of any kind. Above that they are wooded, but only with the dull and stunted spruce first of these regions."

The *Bulldog*, after coaling at Sydney, was about to recross the Atlantic, making a second series of soundings, a little to the north of the first, as far as Iceland, and would then return home. We fear that the extreme inclemency of the present season, which does not often recur, must always be regarded as a possible, and very likely a periodic occurrence, must show that no cable can, with safety, be laid in this direction. There seems no reasonable prospect of so far securing a cable against the effects of ice as to insure its preservation during a single winter; and it is evident that, should an accident happen, the summer months of the next summer might elapse before the attempt of injury could be even approached.

There is no doubt that the survey made by the *Bulldog* will have great value in increasing our knowledge of the Atlantic sea bottom, and we know that there is on board one ardent naturalist who is able and willing to record all that is of interest to the inhabitants of the great ocean depths as well as those near the surface. We look forward with much interest to hear further of the details of this expedition.

CLARA NOVELLO.

THE CURT of this great artist may now be regarded as closed. The two great performances of sacred music last week, at the Crystal Palace, were her *adieu* to the public of the metropolis. She has yet to take farewell of some of those towns in the provinces which have been the scenes of her former triumphs, and then her voice will be heard no more. No Englishwoman, either of our own or any former age, has ever run so brilliant, and very few so long a course. The fame of our most celebrated singers of former days has been confined to their own country, while she has a world-wide renown; and, though she retires in the strength and vigour of womanhood, she has enjoyed her renown for thirty years. Another remarkable circumstance is, that she has this retirement chosen for herself, and not been driven to it by private life, on her elevation to the rank which she is so well qualified to adorn. For reasons which do her honour, she renewed her professional exertions, and resumed a career which became more splendid than ever. She now retires again, and this time, her retirement is final.

Clara Novello was born in London in the year 1818. Her father, Vincent Novello, one of the most distinguished musicians of his time, yet survives, an aged and venerable man, whose name will live in his valuable works. At six years old, she was placed at M. Choron's *Conservatoire de Musique Sacree*, at Paris, a seminary at that time famous for its complete and solid system of musical instruction. There the youthful pupil showed her superiority, at one of the annual concours, by carrying off a prize from nineteen competitors, all of them older than herself. In consequence of the disturbances caused by the Revolution of 1830, she was brought home. She was then only twelve years old, but so thoroughly conversant with the principles and practice of her art, that her father found her competent to perform before the King and the Emperor, and at every musical performance throughout the kingdom, where the highest talent was in request. She was invited to the well-known Gerandini's concerts, of Leipzig, then under the direction of Mendelssohn; and we find her afterwards singing with success at Berlin, Vienna, and St. Petersburg.

She now, under her father's wise counsel, repaired to Italy, which has for centuries been "a land of song," and still possesses a school of vocal music superior in many respects to that of any other country. At that time it was better than it is now. It preserved, under the influence of Rossini, much of its pristine purity, and had not been vitiated by the noisy style introduced by that great master's successors, and especially by Verdi, the fashionable favorite of the present day. Soon after her arrival in Italy, our young countrywoman had the good fortune to attract the attention of Rossini himself, who took a warm interest in her welfare. By his advice she abstained from all public engagements, and devoted herself for a year to a course of study for the Italian stage. Her first appearance was at Padua, in Rossini's *Semiramide*; and she was, then, engaged to sing at the theatre of the Apollo upon her from Rome, Milan, Bologna, and most of the chief theatres in Italy. At Bologna, where Rossini resided, she was chosen by him to sing the principal soprano part in his "Stabat Mater," when that splendid work was first performed under his own direction. The English public has become familiar with this "Stabat Mater" through numerous performances by the greatest foreign and English singers of the day; and, as a combination of power and beauty of voice, brilliant execution chastened by purity of style, and earnest simplicity of manner, the palm has been generally, we may say unanimously, given to the performance of Clara Novello.

During this period, through some blunder on the part of an agent, she found herself involved in a double engagement, for Rome and Genoa. Neither city would give up its claim; and, as she happened at the time to be at Ferme, in the Papal States, the Government resorted to the strong measure of detaining her there, in a sort of captivity, in order to secure her services for Rome,—an incident which at first excited the indignation of the celebrated Gabrieli, who was impressed by the Viceroy of Sicily for refusing to sing at Palermo—a piece of despotism which only drew from her the spirited declaration, that the Viceroy might make her cry, but should never make her sing. In Italy, where she was, in a sort of state; and, after much diplomacy, the matter was adjusted by an arrangement, which required that she should sing first at the one place and then at the other. On this occasion, it is said, she first became acquainted with a young nobleman of a distinguished family, Count Giglicini, whose kind exertions contributed to relieve her from her embarrassing position. At all events, it was soon afterwards that her marriage with Count Giglicini took place, and their union has been, in all respects, a happy one. Her virtues and talents are sufficient to adorn the most exalted station; and her husband, who has long been well known in London society, is generally esteemed for his excellent qualities and agreeable manners.

Before her marriage, Clara Novello returned to England, and appeared for a short time at Drury-lane Theatre, then under Mr. Macready's management, and at several counties and provincial festivals. But, on this event taking place, she retired into private life. The political troubles of 1848, however, and their influence on the fortunes of individuals, induced her to resume her professional duties; and, in the year 1850, she re-appeared under her maiden name. During the last ten years she has pursued her arduous labours with indefatigable energy and brilliant success, not only in Italy, Germany, Spain, and other parts of the continent, but in England, where she has passed a considerable part of every year, the last ten years which have been begun to shine on Italy, and other circumstances, now allow her to cease from her self-imposed toils—no longer Madam Clara Novello, but the Countess Giglicini,—to retire with her husband to the enjoyment of her proper social position in her adopted country.

OPENING OF THE LYCEUM THEATRE.

MADAME CRESCENT inaugurated her winter season on Monday night with a re-decorated house, some additions to her company, and a new piece by Mr. Tom Taylor. The house itself deserves unequalled praise. It is very elegant, bright, and cheerful, and has more the air of one of the choicest French theatres than of the dingy and dreary structures to which we are ordinarily accustomed. The aspect of such an interior goes a considerable way towards putting an audience into the proper disposition to enjoy the entertainments prepared for them—a fact of which English managers in general seem to have resolved to remain eternally ignorant, although it lies on the surface of all theatrical experience. The art of providing for the comfort of the public is a modern discovery, which none of our theatrical houses have shown much inclination to adopt, with the exception of the Adelphi, which has been to perfection, and the Lyceum, where a luxurious taste has left little to be desired.

The additions to the Lyceum company are Mr. Keeley, whose *entrées*, after what we all felt to be a long absence from the stage, was hailed with a burst of enthusiasm; Miss M. Terman; Mr. George Vivings, a careful and painstaking actor from the Olympic; and Mr. Watkins, from America, announced in the bills with a preliminary panegyric, which it is not possible to endorse from our present limited knowledge of his capabilities. The company, drawn up for the National Anthem, at the closing of the new piece, presented a prosperous appearance, which, we hope, may be an augury of the future fortunes of the house.

The new piece by Mr. Tom Taylor is called "The Brigand and his Banker." It is drawn bodily from M. Elmeind Alout's well-known story "Le Roi de la Montagne," a narrative of irretrievable humours, characterised by wit and there with shadows of earnestness. Some liberties have been taken with the original, without contributing any equivalent advantages to the drama, which is a singularly feeble reflection of a tale remarkable for its breadth and vigour of treatment. The whole plot consists in the adventures of a few excursionists from Athens in the neighbourhood of Mount Paros, where they are made prisoners by *Hadjis* Scaros, a terrible brigand, who infects that neighbourhood, and who is known by the title of "The King of the Mountains." *Hadjis*, under the usual penalty of desecration at the end of a certain number of days, sets a heavy ransom upon his prisoners, one of whom, a "strong-minded" Englishwoman, who is accompanied by her sister, Mr. Keeley,—happens to be the sister of the brigand's London banker, who holds in his hands a large sum belonging to *Hadjis*. The Englishwoman tricks the Brigand (although the means by which the end is accomplished are exceedingly obscure in the play), by contriving that her brother shall pay her

ransom out of *Hadjis*'s own money. The other excursionists are variously provided for. One, a German student, who is in love with the strong-minded lady's niece, attempts his escape down the rocks, but is hunted by dogs and retaken; and another, an American Captain—the part assigned to Mr. Watkins—is saved by the daughter of the Brigand—a picturesque character in a rich Greek dress, having little to do in the way of acting, but affording Madame Crescent an opportunity of showing her skill in some effective pantomime, and in dancing the "Komaika," which she executed with grace and brilliancy. In the last scene, by a transparent device, which provoked a snigger in the house more fatal than open condemnation, all the excursionists are brought back into the power of *Hadjis*, who has discovered the trick attempted to be played upon him, and orders them to be tortured; when suddenly his daughter appears upon a rock, with the American captain holding her by the girdle, and threatening to dash her to pieces over the precipice, if his friends are not immediately released. Of course we know the result. The Brigand yields to an argument which deeply touches his tender old heart, and which, moreover, is quickly refuted by a rush of sailors, and we believe, soldiers also, to the rescue, whose appearance, although nobody can tell where they came from, is naturally expected by a public well instructed in this infallible dramatic expedient.

Mr. Taylor's facility of composition, and long practice in the employment of stage business, enables him to keep the stage in movement under the most unlikely circumstances, and to fertilize the most barren spots with sprightly dialogue. But you cannot make bricks without straw. The vital principle of the drama is action. There must be action, mental or physical. There must be a story, developed in dramatic situations, and not a series of metaphors, the less forced and more natural the better. But here we have neither action nor story. The piece is built up of conversations and detached bits and scraps of scenes, not wanting in occasional flashes of cleverness, but totally deficient in unity of construction and a pervading interest. It is no doubt a "pleasant evening's work," but is infinitely inferior to it in striking contrasts of character, and in the skill with which the astounding variety of that play is presented and sustained. "The Brigand and the Banker" is better adapted to the region of the amphitheatre than to that of the Lyceum; and with an expansion of the low comedy, and the introduction of horses, it might be attended with a measure of success which we apprehend it is not likely to achieve in its present locality.

The piece is put upon the stage in the best possible manner. The two scenes through which it passes are exquisitely beautiful; and the acting is quite equal to the demands of the play. Mr. Keeley's delineation of the Englishwoman who refuses to believe in brigands, with phrases implicit confidence in the powers of her own government, and who, in the last resort, threatens to write to the Times, was capital, and secured the safety of the drama at moments when it was sinking, from lack of strength. The masquerade into which Miss M. Terman is put, by being made to assume a Greek costume that does not at all become her, and the scene of the Greek especially as there is no reason for abandoning the riding-dress in which, strange to say, she has ascended the mountains. The Brigand and the American captain are stock characters; and the English servant, delivered with muchunctuous humour by Mr. House, is known to the melodramatic stage in a thousand shapes. Mr. George Vivings, who plays the part of the Brigand; but we must defer our judgment of Mr. Watkins until we see him in a part of more original pretensions.

NECROLOGY OF EMINENT PERSONS.

LORD FRENCH.

On the 26th ult., at Farnley Hall, county Mayo, Ireland, in his 75th year, Charles, second Baron French, of French Castle, county Galway. Born 9th April, 1796; succeeded his father, Thomas French, first lord, December 9th, 1814. He was a zealous Roman Catholic, and follower of Mr. O'Connell throughout that gentleman's long career of Irish agitation. Lord French was the first magistrate to whom Chancellor Gaskell directed his celebrated missive in 1843, signifying the intention of Her Majesty's Government to remove from the management of the peace any person who took part in furthering the visionary scheme of a repeal of the Legislative Union, and which acted as a signal for the commencement of hostilities between Sir Robert Peel and the Brexideers. His lordship married, 29th Dec. 1820, Maria, eldest daughter of the late John Browne, of Moyne, county Galway, Esq., and by her, who died July, 1827, had issue—Thomas, now Lord French; the Hon. Martin French, the Hon. and Rev. John French, the Hon. Jasper French, and the Hon. Margaret, married to Valentine O'Connor Blake, of Tower Hill, county Mayo, Esq.

SIR JOHN K. SWINBURNE, BART.

On Wednesday, 25th of September, Sir John Edward Swinburne, of Caphen Castle, Northumberland, Bart., F.R.S., son of Sir Edward, fifth baronet, by Christiana, daughter of the late John Dill, Esq., of Bordeaux, in France, March 6th, 1762; married July 18th, 1787, Emma, daughter of Richard Henry Alexander Brouet, of Bechemham, Kent, Esq., and niece of the late Duchess of Northumberland. Succeeded his father November 2nd, 1786. His Lady Swinburne, who died in 1839, he had issue, two sons and three daughters. The venerable baronet, who had survived till next March, would have entered the 100th year of his age, was a warm patron of literature, and a generous friend to literary men. His library at Caphen Castle was probably the largest in the north of England. His eldest son Edward, and his other son Henry, both died before him. A grandson succeeds to the title and estates.

THE DOWAGER LADY WROTTELEY.

On the 20th ult., at Clifton, Bristol, in the 74th year of her age, the Right Honourable Julia, Dowager Lady Wrotteley, Her ladyship, who was the daughter of John Conyers, Esq., of Copthall, Essex, was first married to Captain the Hon. John Astley Bennett, B.N., and secondly to Major-General Sir John Wrotteley, Bart., who was raised to the peerage by letters patent, July 11th, 1828, as Baron Wrotteley, of Wrotteley, co. Stafford, and father of the present peer, by his first wife, Lady Caroline Bennett, daughter of Charles, fourth Earl of Tankerville. The late Lord Wrotteley died March 10th, 1841, leaving her widowed by his second wife, the lady now deceased.

MR. JOHN DUNN, M.P.

On the 10th ult., at Aden, on the Red Sea, en route to Australia, of apoplexy, John Dunn, Esq., M.P. for Dartmouth, and formerly Member of the Legislative Council of Tasmania. Mr. Dunn was a merchant and ship-owner in London, and largely engaged in the Australian trade. He contested Totness unsuccessfully in May, 1859, but was elected for Dartmouth in the August following, and generally supported the Conservative party.

THE REV. DR. ALEXANDER FLETCHER.

The death of this eminent divine took place on Sunday morning, at his residence, 4, Portland-place, London, after a protracted and painful illness. Deceased was born at Bridge of Tait, near Stirling, in April, 1767, and was thus in his 74th year. He was licensed to preach in 1806, was ordained, at his native place, in 1807, and was called to London in 1811, where he remained till his death. He was a man of deep and earnest sympathies, and gained a firm hold on the affections of all with whom he came closely in contact.

MR. ERNESTUS LANDELLS.

We regret to announce the death of this well-known engraver on wood, which took place at Brompton on Monday morning. Mr. Landells had been for some time in ill health, but his demise was unexpected. He was in his 63rd year. He was a native of Newcastle-upon-Tyne, where he was a pupil of Thomas Bewick, the celebrated engraver, and Mr. Landells's best woodcuts have much of the artistic feeling of his master. Mr. Landells came to London about thirty years since, and had since been connected with the leading illustrating periodicals of the day. In 1841, he was one of the originators of *Punch*, his share in the copyright of which he disposed of in the following year to the present proprietors of that popular journal. In the autumn of 1842 Mr. Landells was commissioned by the proprietors of the *Illustrated London News* to sketch and engrave the scenes and incidents of Her Majesty's visit to Scotland; and his success on this occasion led to his being subsequently engaged by the same journal, the several visits of the Queen to various parts of the United Kingdom, and the continent. He was likewise the originator of the *Illustrated Magazine*, 5 vols., and one of the original proprietors of the *Lady's Newspaper*. To this arduous branch of his art Mr. Landells brought considerable skill, as well as an untiring energy, such as could enable him to sketch and engrave incidents from some hundred mile distance, so as to meet the requirements of a weekly newspaper. In private life he was an affectionate husband, an indulgent father, and a warm-hearted, generous friend.

WILLS AND BEQUESTS.

Baron Denis Moses Samuel, of the kingdom of Portugal, and Commander of the Order of the Rose of the Empire of Brazil, died at his residence in Sussex-place, Regent's Park, on the 10th of August last. The baron was possessed of personal property in this country which was estimated for probate duty at £200,000; he was also possessed of foreign securities in Greece, Turkey, and Brazil; as well as East-India stock and landed estates. The will bears date the 1st of July, 1850, and was drawn up in the English form, and administered to in London on the 28th of September, by his widow, the sole executrix. This accumulation of wealth he has bequeathed to his wife and two sons—his wife, the baroness, taking a life-interest in certain of the securities, as set forth in the will; the sons receiving annuities until the age of twenty-five. His only daughter the baron had provided for on her marriage. The will is entirely in favour of one, the only exception being a few legacies which he has given to his clerks and servants. The rest of his personality he has left to his wife absolutely, whom he has appointed residuary legatee. The landed estates, on the decease of the baroness, will pass to the eldest son. There is a service of plate bearing the royal arms of Portugal, which he has bequeathed to the baroness for life, and then bequeaths it on his eldest son, to be kept by the family in perpetuity. There being a question of property depending upon the assumption of the name of "De Vail," the baron obtained the royal permission to incorporate it with his own, and which he has requested his heirs and successors to adopt and use hereafter.

Colonel John Cooper, late of the Bombay establishment in the Hon. East-India Company's service, but residing at the city of Bath, where he died on the 21st of July last, had executed his will in 1857, which was proved in London, the 17th September following, by his eldest son, John, Esq., of Beckington, Essex, the sole executor. His personal property was sworn under £10,000. To his son Frederick Charles Cooper he leaves a sum amounting to about two-thirds of his property, and has appointed him the residuary legatee, his annuities together taking the other part of the property. His only daughter he had given a sum, on her marriage, equal in amount to her sister. The will is attested by John Wright and Francis Bryan Wright, goldsmiths, Bath.

Major-General Arthur Goodall Wessell, K.F., K.C.B., F.R.S., of the Mexican army, died at his residence, Ludlow-street, No. 10, on the 10th of July last, aged 75. His will, which is entirely in his own handwriting, although it is not dated, is known by the attesting witnesses, Alexander Fennie, J.P. Elliott, and George Sturges, of Northfleet (who signed, together with Sir Robert Alexander, since deceased), to his own executor, he had given a sum, on her marriage, equal in amount to her sister. The will is attested by John Wright and Francis Bryan Wright, goldsmiths, Bath.

Major-General Horatio George Brooke, of Gloucester-place, Hyde Park, died on the 20th of August last, aged 70, having made his will on the 11th of June preceding, which was proved on the 25th of September, by his executors, namely, his relict and Horace Brooke, Esq., his son, the personality being sworn under £12,000. To his relict he leaves an annuity of £120, charged upon his landed estates in Suffolk, which he has also left her a life interest in his furniture, plate, linen, china, books, pictures, &c., absolutely, and further bequeaths to her the income and profits arising from the residue of his real and personal estate for her life, and after her decease, to his son Horace absolutely. His land and farms in the parishes of Barking and Beagat 79, together with the residue of £120 to his relict, he has devised to his son Horace. He has bequeathed some small annuities upon three widows. This gallant officer was attached to the 68th Foot, and was promoted to the rank of major-general in 1856. He was the relict presumptive to his nephew, Sir George Nathaniel Brooke, Bart., who, although married, has no issue.

Nathaniel Goldmist, Esq., Barrister, of the Inner Temple, and of Upper Berkeley-street, but late of Grosvenor-street, Hyde Park, where he died on the 10th of August last, aged 63, had executed his will in London, in September, 1858, and in the present year, whilst residing in Paris, executed two codicils. This gentleman was twice married, having three children as issue by his first wife, who are all amply provided for, as well as his relict, under various settlements; and to her he leaves a life-interest in his property, and the furniture absolutely; the plate, on her decease, passes to the sons. The deceased's personality was sworn under £10,000, and there is considerable property under the settlements, as well as landed estates. The actual executors being Captain Henry de la Rue, Esq., and James Young, Esq., of the Isle of Wight. The testator was of the Roman Catholic faith, and he has given some stringent directions to his executors and trustees, and particularly to those persons whom he has nominated as guardians for his children, respecting their being brought up in the Roman Catholic religion; indeed, his only daughter is at this time a novice in a convent at Rome.

The Reverend Henry Worsley, LL.D., Rector of Hayes, Middlesex, of Newport, in the Isle of Wight, and of Clapham Common, Surrey, at which latter place he died on the 15th of August last, aged 79, having made his will on the 1st of the year 1853, which he appears to have in no way altered, either by codicil or otherwise. The will is exceedingly brief, and contains but one direction, namely, the disposition of his property, real and personal, furniture, effects, &c., to his wife absolutely.

Reviews of Books.

ROMANTIC NOVELS OF MODERN LIFE.*

The romantic element enters so slightly into modern English life, that it can hardly be said to have any existence at all, except as a matter of sentiment. And even as a matter of sentiment it amounts to nothing more than a slight mannered feeling in the mind, upon the commonplaces of conversation, and never influencing our actions. We are, in the strictest sense, a practical people. It would be summing too much to deny that there are young ladies who marry for love, and young gentlemen who grow away from their parents, and leave their families in preference to what is called literary interests; but there is always room for a doubt whether such cases may not be referred to weakness of character, selfishness, or indolence, or to twenty other causes, rather than the inspirations of romance. After marriage, at all events, whatever elevations may take place before, the affairs of life are conducted upon business principles. Families are usually governed in their relations with society by prudential considerations. Outward appearances are respected; conventional forms are observed; and perturbations arising from individual eccentricities are seldom allowed to displace the settled order and routine which is in our pleasure, by common sense, to live. This way of existence possesses all the advantages which may be reasonably expected to accrue from respectability and uniformity; but it is undeniably dull. It affords hardly any scope for the play of fancy, the caprices of genius, or the pursuits of morbid imagination—Murder, robbery, and forgery abound; but they become reduced, by the nature of our social compact, to vulgar crimes, merely assume heroic shapes or dimensions, and never excite any sympathy. The law asserts an influence which is fatal to the cultivation of exceptional flights of imagination, in reference to questions of life and property. We cannot hunt down our enemies, kill our wives, carry off young girls, and shut them up in lonely towers, overlooking the sea and sea, pursue wild, forge conveyance, or, in short, perform any of the higher existing deeds that we delight in seeing done upon the stage, without bringing ourselves under the disconcerting grips of the law. The romantic inclination, whenever it shows itself, is taken out of us at once by a process which is conclusive of all further experiments in that direction.

Hence the skilful dramatist who desires to deal with romantic or picturesque ingredients takes care to lay his scene in a distant country or a remote age. He knows well enough that it would never do to exhibit a melodramatic villain in a recent hat and a frock coat, prowling about Regent-street, with a brace of pistols in his pocket; or to make a lady in crinoline perpetrate the feats of a genuine heroine in a West-end drawing-room. He is aware that the unreasonableness of the combination would be detected at a glance by the discriminating British public. Consequently he treats his actions and actions of his mind, under various names, and them in a far-off land, where he can set up any laws or moralities he pleases, without fear of awaking the critical scruples of his audience. The violations of common sense and ordinary probability which we reject as absurd in an English fiction, prove to be necessary to reproduce the manners and the scene of our day, fascinate our judgment, when they are dressed up in strange costumes, belted garb, and daggers, stouthead hats, and yellow boots. It is idle to ask the reason of this inconsistency. It may be a mysterious provision of nature which furnishes us with a taste of fictitious life superior to the actual conditions; or it may be that we are willing to believe the rest of the world quite capable of the irrational and criminal courses which we are ourselves wise enough to detect. But, whatever may be the ground of this curious contradiction, the fact is undeniable.

Our writers of modern novels are not so deluged in their craft as the dramatists. For the most part, they ignore the poetic character of our society, and substitute epigrams and tinsel for our plain broadcloth. They will insist upon making the basest of our contemporaries do the noblest of our actions, and will induce into situations in which young ladies are never known to appear, except at Astley's or the Victoria. The things that are sometimes done in these books by

* On the Cliffs. By Charlotte Chatter, author of "Fanny Coombes." Two Vols. London: Smith, Elder & Co.

article. The writer very fairly remarks:—"They have the remedy in their own hands; why don't they withdraw their deposits from the savings banks, and form a joint fund to establish a flour-mill, a bakery, and a grocery shop?" "The Ammergau Mystery; or, Sacred Drama of 1860;" is a description, by an eye-witness of the most extraordinary spectacle in Europe—that is, the deœcenal "play," or "mystery" in Bavaria, of the sufferings and passion of the Godhead. The just, reverent, and impartial spirit in which such a subject is dealt with, makes this the most remarkable contribution to periodical literature for the month. "Kyrie Jonck," and "Tom Brown at Oxford," are the continuations of stories commenced in previous numbers.

The *Relicist*, a monthly review and miscellany, contains the following articles:—1. The Pauline Doctrine. 2. A Contrast; or, Theological Influences. 3. The Province of Reason. 4. Church Principle and Life. 5. Egypt's Place in Universal History. 6. The Social Afflictions. 7. Home Evangelization. 8. The Story of Ralph Hakem, the Druse, With two excursions all the way to the Lebanon, and with matters connected with religious belief. "The Story of the Caliph Hakem" is a curious piece of biography. It presents the details of a life which was a compound of "crusity, caprice, and profanity, ebullient by occasional fits of generosity, and acts of summary justice." Such was "The Messiah" of the Druses; and it cannot be a matter of surprise that they who worship such a deity should have recently committed atrocities in the Lebanon that have excited universal horror throughout Christendom.

In the first article of the *British Quarterly Review*, the past condition of Ireland is truly described in one sentence:—"Her political system had been the agency of an alien colony over a nation, and her social condition had been the tyranny of a caste over a subjugated people." The writer then shows what was the state of Ireland thirty years ago, and illustrates its position by a reference to Irish metropoles. From the past the writer proceeds to the present condition of Ireland; and here again he draws a picture which is as accurate in its details as it is gratifying to behold. The article is of unusual value, and well worthy the attention of all who are desirous of having a sound knowledge of the past history and present situation of Ireland. The second article is a complete analysis of "Mr. Atkinson's Travels in the Regions of the Upper and Lower Amoor." Art. iii. is a paper which reads like a romance, and the subject one of the most interesting in natural history. It is upon the growth, progress, and inevitable destruction of "Glaciers." With the same power and ability are written articles on "German Philosophy and Literature," "Burton's Lake Regions of Central Africa," "Modern Painters," "Egyptology and the two Exodus," "Christian Races under Turkish Rule," "Hours with the Mystics," and a variety of criticisms on recent publications.

There is a very valuable and instructive paper on "German Ideology," by Mr. Cyrus Redding, in the October number of *Colburn's New Monthly Magazine*. There are two articles in the same magazine—one based upon a book written by Mr. Gurney, the other upon Mr. Wingerock's work, and both pointing to the same conclusion—that Algeria is a failure as a colony, and ultimately the French will be forced to leave it. "On Board a Cartel" is manifestly not an invented story, but the genuine record of circumstances that had occurred within the presence of the narrator.

The *New Quarterly Review* is a "Conservative" periodical, and the first article is devoted to the present fallen condition of its party as represented in "Concurrence journalism." Considering the wealth, the power, and the influence possessed by the Tories, it is certainly strange to find their newspapers so few in number, and so insignificant in influence. The Whigs have acted in the same stupid way in Ireland. They have left the press there in the hands of the Tories and the "Young Ireland" faction, and the consequence has been that the representation of Irish counties and boroughs has slipped out of their hands. A very fair review of the acts of "the Session of 1860," constitutes the second article in the Review. The third article, "The Syrian Disurbances," casts the entire blame of the atrocities committed in the Lebanon upon the Christians. The first of the murders perpetrated were, it declares, by the Maronites on the Druses. Upon the principle of "audi alteram partem," this article in the *New Quarterly Review* is deserving of examination.

There are three magnificent engravings in this *Art Journal* for October. The first is a picture of the beautiful and unfortunate Henrietta of Orleans, daughter of Charles I, who unconsciously felt a victim to poison in the midst of the dissonant court of Louis XIV. The second is an engraving, by Comen, from Turner's well-known grand picture, "The Opening of the Waltham," in the National Gallery. The third is Ernst Habner's statue of "Medicine." In addition to these there are many fine wood engravings, illustrating the course of the Hudson river, from the wilderness to the sea; and the companion guide of Mr. and Mrs. E. C. Hall in South Wales. The literary portion of the *Art Journal* is always valuable and interesting; but that feature of it which is, in our estimation, the most curious and instructive, is the series of papers contributed by Mr. Thomas Wright, entitled, "Miscellaneous Illustrations of Mediæval Manners."

"Seeing is Believing," is the title of the first article in *Blackwood's Magazine*; and a very able article it is on "Spiritualism." The main purpose of the writer is to reply to the statement which appeared in a former number of the *Blackwood Magazine*, from a gentleman who gave a narrative of what "he had seen" performed, and the marvels he had witnessed at a *séance* of "Spiritualists," "Spirit-rappers," and "Table-turners." The writer in *Blackwood* makes this just observation upon the subject of such exhibitions, the course of the Hudson river, from the wilderness to the sea; and the companion guide of Mr. and Mrs. E. C. Hall in South Wales. The literary portion of the *Art Journal* is always valuable and interesting; but that feature of it which is, in our estimation, the most curious and instructive, is the series of papers contributed by Mr. Thomas Wright, entitled, "Miscellaneous Illustrations of Mediæval Manners."

think accurately, and reason closely, it is justly observed, "if convinced that monarchs are not much wiser or better than other human beings, they run off into the belief that all things have been little more than inaccurate demons; they convinced that representative government often works very imperfectly, they raise a cry for imperialism; if convinced that monarchy has its abuses, they call out for republicanism; if convinced that Britain has many things which are not so good as they ought to be, they keep constantly entreating the perfection of the United States." The article is suggested by the Archbishop of Dublin—the most logical of platonists—prefaces—the most worldly-wise of all the learned Sokomons in the House of Lords. The second article, "A Last Word on Lord Macaulay," will not be received with universal approval, for it deems "that Macaulay belonged to the very highest order of mind," and it then maintains that "in no department, except the historical, did he show pre-eminent capacity." The writer will find it difficult to defend either of these two positions.

LOUISE ON THE DOOR-STEP.

I.
HALF-PAST three in the morning!
And no one in the street
Not me, on the sheltering door-step
Resting my weary feet—
Watching the raindrops patter
And dance where the puddles ran,
As bright in the dawning light
As dewdrops in the sun.

II.
There's a light upon the pavement—
It shines like a magic glass,
And there are faces in it,
That look at me, and pass.
Faces—ah! well remembered
In the happy Long-Ago,
When my gait was as white as lilies,
And my thoughts as pure as snow.

III.
Faces! ah, yes! I see them,—
One, two, and three,—and four—
That come on the gust of tempests,
And go on the wind that lures.
Changeful and evanescent
They shide 'mid storm and rain,
Till the terror of their beauty
Lies deep upon my brain.

IV.
One of them frowns; I know him,—
With his thin long snow-white hair,
Caring his wretched daughter
That dreads him to despair.
And the other, with wakening pity
In her large, tow-streaming eyes,
Seems as she yearned toward me,
And whispered "Paradise."

V.
They pass,—they melt in the ripples,
And I shut mine eyes, that burn,
To escape another vision
That follows where'er I turn—
The face of a false deceiver
That lives and lies; ah, yes!
Though I see it in the pavement,
Mocking my misery!

VI.
They are gone!—all three!—quite vanished!
Let no one call them back!
For I've had enough of phantoms,
And my heart is on the rack!
God help me in my sorrow;
But there,—in the wet, cold stone,
Smiling in heavenly beauty,
I see my lost, mine own!

VII.
There on the glimmering pavement,
With eyes as blue as mine,
Phaëa, by the fire-haired darling
Too soon from my bosom torn;
She clasp her tiny fingers—
She calls me sweet and mild,
And says that the God forgives me,
For the sake of my little child.

VIII.
I will go to her grave to-morrow,
And pray that I may die;
And I hope that my God will take me
Ere the days of my youth go by.
For I am old in anguish,
And long to be at rest,
With my little babe beside me,
And the daisies on my breast.

THE ATLANTIC AND GREAT WESTERN RAILWAY,

CONNECTING
NEW YORK AND ST. LOUIS,

BY THE JUNCTION OF THE NEW YORK AND ERIE, AND THE OHIO AND MISSISSIPPI RAILWAYS.

A CONTINUOUS SIX FEET GAUGE,
TWELVE HUNDRED MILES, WITHOUT CHANGE OF CARRIAGES.

ISSUE OF ONE MILLION DOLLARS FIRST MORTGAGE BONDS, BEARING SEVEN PER CENT. INTEREST.

Payable Half-yearly, on 1st JANUARY and 1st JULY, at the BANK OF LONDON, Threepenny-street, London; and at the Banking-house of Messrs DUNCAN, SHERMAN, & CO., New York.

The Four Coupons first maturing will bear the Guarantee of the Bank of London, duly endorsed, thus guarding the investment against any possibility of default during the construction of the Lines in Pennsylvania and Ohio.

TEMPORARY OFFICES—11, ST. HELEN'S PLACE, BISHOPSGATE-STREET, LONDON.

THE ATLANTIC AND GREAT WESTERN RAILWAY—378 miles in length—is the middle link of a Grand National Line of 6 feet gauge, 1,800 miles in length, from New York through the great States of New York, Pennsylvania, Ohio, Indiana, and Illinois, to St. Louis; of which about 800 miles have been many years in operation. It possesses extraordinary facilities for construction, having no tunnels, no deep cuttings, few bridges, and no ferries; avoiding the Alleghany Mountains on the South, and occupying the natural channel of trade between them and the Lakes on the North. It traverses some of the most fertile portions of New York, Pennsylvania, and the "Garden of Ohio." It passes through the large shire towns or centres of fourteen Counties in the State of Ohio, with more than one million of inhabitants, and a taxable property of 200,000,000 dollars, and accommodates seventeen cities and towns in New York and Pennsylvania, heretofore without railway facilities.

The differing laws of the States of New York, Pennsylvania, and Ohio, through which the line runs, render separate organizations necessary, though practically the whole is one line. The present issue is confined to the Bonds of "New York," that section being now finished; a considerable portion of the works in "Pennsylvania" is also finished, and the "Ohio" section is in a very forward state, and can be completed in 1861. As each of these sections is opened, the Bonds will be issued to the public, all the funds being provided in the mean time by calls on Stock and advances by the Contractors.

The ATLANTIC AND GREAT WESTERN connects with the NEW YORK AND ERIE (of which it is a continuation) at "Salamanca," about 400 miles from New York; and the NEW YORK AND ERIE RAILWAY COMPANY deem "the connection to be of such importance, from the large and valuable traffic which it will concentrate and throw on their road, that they have consented to pay to the ATLANTIC AND GREAT WESTERN a bonus of 10 per cent. on the gross receipts from freight and passengers during five years from completion, and 5 per cent. for another term

of five years thereafter." This Bonus is especially appropriated to securing the interest on Bonds.

The association of M. DE SALAMANCA with the ATLANTIC AND GREAT WESTERN RAILWAY is a voucher that the merits of the enterprise are not overstated, and an assurance that the whole line will be rapidly completed and its resources developed.

The Bonds are secured by a first registered mortgage, constituting a lien on the income and all corporate rights, privileges, lands, franchises, plant, and property of the Railway; and give the holder the right of conversion into shares at par until 1st January, 1864.

The Bonds of the present issue are of 1,000 dollars each, redeemable at par in twenty years, are transferable without stamp or endorsement, with Interest Coupons attached, and will be paid on the 1st of JANUARY and 1st of JULY in each year, at the BANK OF LONDON, Threepenny-street, London, and at the Banking-house of Messrs. DUNCAN, SHERMAN & Co., New York.

The Bonds will be issued at £150 sterling per Bond of 1,000 dollars—to include the Coupon (value 47) due 1st January, 1861, and will be delivered on 1st November, 1860, or earlier, at option of the purchaser. Each bond will bear £14 per annum interest, estimating the dollar at 4s.

The road represented by these Bonds is finished, its cost is known and liquidated, and its interest and dividends will be paid from its actual earnings.

The value of the security offered may be best appreciated by comparison with the four great lines of the same system.

The contract cost of the Atlantic and Great Western Railway is 37,000 dollars per mile, say £7,400 sterling. Hence, an average receipt per annum equivalent to that of the four great lines now running east and west, will give an annual return upon the whole cost, Capital and Bonds, of 17-35 per cent., allowing 50 per cent. for working expenses.

A Notarial Copy of the Mortgage of the New York Section, duly attested, may be seen at the Offices of the Company; the original being duly recorded in New York by the Trustee.

Applications for Bonds must be made to the Brokers. Copies of the Prospectus, with Map, and the Reports of the Engineer-in-Chief, can be had from the Brokers, or at the Offices of the Company, No. 11, ST. HELEN'S PLACE, LONDON.

THE LONDON REVIEW

AND WEEKLY JOURNAL

Of Politics, Literature, Art, & Society.

CONDUCTED BY CHARLES MACKAY.

No. 15.]

SATURDAY, OCTOBER 13, 1860.

[PRICE 3d.]

THE POPE, THE KING, AND THE EMPERORS.

A MAN in the high but difficult position of Garibaldi must march from success to success, if he would escape detraction. At the least sign of ill-fortune, concealed enemies, and false friends, and all the ignomies throng who look upon Virtue as a reproach against themselves, yelp their mean displeasure. Garibaldi has passed through this ordeal, and, like other great men, has scorned and survived it. Having won the brilliant and all but decisive victory of the Volturno, and justified his great reputation by a great deed, the critics who last week felt inclined to hiss, now find themselves compelled to applaud; and once more Garibaldi is the man of the time, and the Washington of Italy.

Beaten at the Volturno, but still holding on, though with a feeble grasp, at Capua and Gaeta, the unlucky King of Naples has made a piteous appeal to Europe. But for him there can be no help, except that which lies in his own right hand,—a fact with which he is, doubtless, by this time better acquainted than he was a week ago. The Roman Catholic Powers have an interest in the Pope as a spiritual, if not as a temporal sovereign; but no one has a title as much interest in the Bourbon dynasty of Naples. No doubt all the despots of Europe are grieved that a brother despot should come to such humiliation and ruin as poor Bombino; but their own houses are in too much danger to allow them to spare either time, or men, or money, for the support of a king who can do nothing for himself. There will, perhaps, be one more short struggle, and there will be an end of Francis II., except as a private gentleman, when, like Adam expelled from Paradise, he will have the world before him to choose his place of rest,—anywhere he pleases, so that it be not in Italy.

But pitiable as are the appeals of the ex-Neapolitan sovereign to the Powers that dare not and cannot help him, the Allegation of the Pope is even more painful. From end to end it is one long whine, interjected with curses, where epithets take the place of arguments, and impotent passion does duty for reason. Few can be so destitute of the organ of veneration as to behold with indifference the ignoble end of such a venerable institution as the Papacy. If the monarchy which for the last thousand years has held its place, alike amid the anarchy of the Middle Ages, and the more menacing struggles of Germans, Spaniards, or Frenchmen, for universal domination, is to perish in this second phase of the great Revolution, after surviving the violence of the first, its last act ought to have been dignified, as became its antiquity and its pretensions. We cannot forget that the origin of the temporal power of the Popes is to be sought in no gift of Constantine or Charlemagne, in no universal-suffrage vote, but in the spontaneous affection of a people. It was a power conferred by so silent a revolution that history bears no trace of its date. It seems to be agreed on all hands that the Papacy is approaching, at length, to the destruction to which it has been so often doomed, though hitherto fated not to die. We are inclined to doubt whether this be its last phase; but, for all the purposes of a short retrospect, we may assume that it is so.

That we should find in its fate the stale moral of the mutability of all things, may seem trite, when we consider the lengthened age it has attained. We might, perhaps, rather be expected to dwell upon the artifice of its structure, which has enabled it to sustain such shocks, and to survive so long. Yet the mutability of fortune was never so glaringly displayed. Louis Philippe, flying in a hackney

coach, was a less striking illustration of it than Pius IX. still seated on his throne in the Vatican. This man was but twelve short years ago the idol of Italy, and the Papacy seemed to have reached, in his person, a degree of power undreamt of by the most ambitious of his predecessors. At his word, not Italy only, but Germany and France, were roused from the lethargy of years, which had succeeded to the agonies of the last decennium of the previous century. The compressed instincts of the nations, encouraged by his example, found a voice to demand the liberties of which the Holy Father was presumed to be the apostle.

It cannot be forgotten how, at the end of 1847, the King of Naples applied to the Pope for an encyclical to calm the effervescence of his subjects, and how the Pontiff answered that a king who gives good laws needs no pastoral. Yet, within one short year from that date Pius IX. was a refugee at Gaeta. He had ceased to reign, for his return under the protection of France was not a restoration. If the last Pope, he is not the first who has been an exile, nor need we ascribe the difference of his fate to the times alone. It is to be sought in his personal character. The heroes of the Papacy were men of a different stamp; they believed in themselves, but with a quite different belief to his; they may have been ambitious—they were not vain. "I have loved justice and hated iniquity," were the dying words of Hildebrand, at Salerno. He died in exile, but the principle for which he had struggled triumphed, and it was with truth that a bystander answered—the lifeless clay heard not the words,—“The ends of the earth are thine inheritance.” Pius IX. represents no principle. He has laboured, not for the reward of the statesman, a memory enshrined in the hearts of a grateful people, but for the meed of the historian—popular applause. From the day when he first proceeded to St. Peter's, amid the shouts of a throng which only ten days before had crowded to kiss for the last time, with bated breath, the feet of his dead predecessor—the funeral catafalque still enumerated the vast basilica—from this first day his career has been marked by the same craving for popularity. Self was, and is, predominant in all his actions. “He does not love me,” was a reason more than once given for setting aside a long-tried servant of the Papacy.

His delight in those early days was to appear on his balcony surrounded by Bengal fires, to chaunt forth a benediction over assembled crowds, and to respond with the alacrity of a Gipsy to the repeated *encores* which his capital singing elicited. He could listen without reproof to the orator who applied to him the words, “There was a man sent from God, and his name was John.” The loss of the popularity he so loved was no cure for his vanity. The castle of Gaeta is on a rock, and he had no difficulty in likening it to Calvary. Escorted by French troops, he, the would-be liberator of his country, re-entered Rome amid the significant silence of the people. Deprived of the gratifying sounds at home, he sought to catch their echoes from abroad. He proclaimed the restoration of a Roman Catholic hierarchy in England, and when this proved a *fiasco*, he negotiated a concordat with Austria, which rendered his spiritual authority as hateful in Germany as his temporal rule had become to his own subjects. Unfortunate in his Church government, most unfortunate when most successful, he next sought to distinguish himself in Theology, and added, of his own sole authority, an article to the Creed of Trent. It was not so that his predecessors won new kingdoms to the Faith, or meddled with dogmatic questions which were not in

dispute. His last performances have all been failures; the applause dear to his heart has been denied by men, and gods, and columns of newspapers, and he has now crowned his ill success by an allocation, the last perhaps that will be heard in the Vatican, and assuredly the weakest that ever issued from it. *The Times*, in its energetic irreverence, calls it a prolonged serech; it is hardly more than a whine. The enemy is at the doors of Rome, and this successor of Lees and Gregories, and Innocents, neither goes forth with cross and banner to confront the intruder, nor hurls at him the greater excommunication he has incurred. We had expected some more startling catastrophe in so great a fall.

And while this is the deplorable state of the Pope and the Papacy, the three Emperors of Europe, aided by a king or two, are preparing for the great work that every one sees must be speedily done—the reconstruction of the Continental system. Italy integrates itself, and Austria disintegrates; a weak power becomes strong, and a strong power weak; and, meantime, the Emperors of Russia and France look on, to devise what plunder they can secure in the break-up, which they fear, while they desire, and which neither of them can prevent. Austria is doomed to disintegration, and Turkey to dismemberment; and the great Italian struggle, on which all eyes are fixed, is but the necessary prelude to both catastrophes.

THE HALF-WAY HOUSE TO INDIA.

OUR attention has been so riveted on the farther East, first by the Great Mutiny, and more lately by the financial difficulties of our Indian Empire, that we have overlooked what has been going on in the Half-Way House. The importance of Egypt in this capacity, has been our excuse for interfering to perpetuate its dependence upon Turkey; and is still our excuse for endeavouring, by force or diplomacy, to maintain the integrity of the Sultan's empire. We have no wish to be masters of Egypt; but it is essential to our very existence that Egypt should be, not only in friendly hands, but in hands which, even if unfriendly, should be powerless to hurt us. We do not, like the Caliph Omar, deprecate the construction of the Suez Canal, from a dread of hostile fleets in the Red Sea; nor from a natural point of view can it signify to us that ten or twenty millions of money should be buried in the Isthmus, in the ostensible prosecution of a work which its real projectors know to be impracticable, or practically useless if carried out. The real object has been already attained, namely, the reduction of the state of blockade to a state of money obligations, and by money liabilities. He has become liable to M. Lesseps for some two millions, more or less, of money, on the one hand; he has also opened the door to claims of French subjects to a still larger amount; and on the other he has come under personal obligations to the Emperor for the loan which he lately effected in France. We have it on good authority, that the property which has been assigned as ostensible security for this loan was already mortgaged. These are the moral fetters in which the Egyptian Viceroy is bound, but the Isthmus of Suez has rendered still greater services to its French patrons. The works have been suspended by orders from Constantinople; but they are not the less pushed forward in the only direction in which they can be serviceable to French interests. A basin in which ships of war can float, a jetty at which troops can land, are now in process of construction at Mex. By some logical process, little bound by the rules of geography, these works are proved to be connected with the Suez Canal; and no doubt the railway, which is to connect them with Cairo, has the same object in view.

French engineers and French workmen overrun the country. Of the latter we are informed, on reliable data, that there are between five and six thousand, all able-bodied active fellows, whom a uniform and a rifle would convert into soldiers. Useless to stem the current of the Nile, the barrage is being rapidly appropriated to the real object its constructors originally had in view—a military post of great strength. Enormous fortifications are being rapidly run up, on which these foreign labourers are employed. In a word, the French occupation of Egypt, more quietly effected than that of Rome or Syria, is not less real. It is directed, not by the French Consul-General, but by M. Lesseps, who, through his influence with Said Pasha, and the patronage which he wields, is a far greater power than the British Consul-General. In our intercourse with semi-barbarians like the Turks, we are far too apt to treat them as we should do Europeans, avoiding even the appearance of carrying favour, and trusting for respect from them to our own self-respect. We may secure their respect, but we forget that this in the East is a very negative quantity. Personal likings and dislikes are the only motives of action, even in the best of their rulers, and so small a part of the insufficiency of our representation is due to their neglect of this line of conduct. For a Turk, Said Pasha is an enlightened man; he is a humane one, and free from the bigotry which was one of the many vices of his predecessor. He deserves credit for his watchfulness and energy in protecting the native Christians, and for his liberality to the Syrian refugees. But in all grave matters he is a puppet in the hands of France, and this entirely by our fault. When he succeeded to the government he was inclined to an independent course; but to

maintain himself in it, he needed support from England, in the shape of only of encouragement in his good intentions, and it was withheld. The result is what might be expected. We have lost in Egypt, as in other parts of the Turkish East, that consideration which we enjoyed before the Crimean expedition, and while we are careless of regaining it, our French ally profits by our *laches* as eagerly as if we were on the eve of a war, instead of the long peace which the Commercial Treaty is intended to secure to us.

THE "CONSERVATIVE PRESS."

WE have a curious account of the Conservative Press from a Conservative organ. The total number of newspapers published in the home empire is put down at 1,050, and of these only 193, or little more than one-fifth, serve the cause of the great party which still aspires to rule the State. In the metropolis the utmost care can only make out 13 papers devoted to Conservatism, and 40 to other parties. Morning and evening, 55,000 copies are issued to advocate Conservative interests, and 200,000 the interests of its opponents. "The penny press is the great fact of the day," and the *Standard* and *Evening Standard* alone do homage to Toryism, while the *Star*, and the *Telegraph*, and the *Express*, all support the Liberals, and the *Telegraph* has an enormous circulation. "The united circulation of the entire weekly Conservative Press is not equal," is the sad lamentation, "to that of a single one of the four twopenny papers, all devoted to anti-Conservatism, which circulate 420,000. They are all pulling down what Toryism tries to build up. Besides being deficient in numbers, Toryism is deficient in talent; and there is now "an absolute necessity that its journals and reviewers should keep pace in point of intelligence and information with the Liberal organs." These opinions of the *New Quarterly Review* are endorsed by the daily Conservative papers, and their dreary condition is accounted for by "the expedient policy of Sir Robert Peel, which not only broke up the great body of the Conservatives, but inflicted on the newspaper proprietor, which stuck to its standard, a most serious permanent injury." "The financial resources of the papers being reduced, the editorial and literary staffs were decreased in number, and in the same ratio the power and ability to compete with the Liberal organs were diminished."

This is a very gloomy picture of the decay of a great and powerful part of society. It is the dying out of a widespread opinion. Looking at the records of the past, or carrying back our memory for one half only of Lord Brougham's existence, we find a period when a Liberal paper was barely tolerated, and Tory journals, protected by Tory Attorney Generals ever ready to pounce on Liberal *Examiners*, circulated largely in every town. This great change has not been brought about by any of the puerile causes to which it is assigned by the Tory journals, aspiring to make the public lose sight of their party by assuming a new name, but by a great change in society, to which the public attention may with propriety be directed.

During the last forty years, if not before, Conservatism, which is only coercive Toryism in a mask, has been engaged in a continual warfare against Progress, and has suffered a continual succession of defeats and disasters. Its own instruments continually wounded it. Huskisson, whom Lord Chancellor Eldon—the incarnation of the principle—hated, was not more fatal to it than Peel, whom Eldon loved and trusted, till he, too, from necessity, betrayed the cause he was elected to defend. The commercial reforms, begun in 1821, were as hostile to Toryism, and as much opposed by squires and monopolists, and on the same principles, as the abolition of the Navigation Laws and the Commercial Treaty with France. The declining party gained a momentary triumph on the unexpected death of Canning, which destroyed the only anti-Tory ministry—a triumph which cost the subsequent Tory ministry what it was obliged to do the work it would on no account allow him to execute. The Tories were constrained immediately to commence a reduction of taxation, and had scarcely got reconciled to their new fate, when an adverse vote of the Commons, conformably to public opinion, compelled them to abolish the Test and Corporation Acts.

From 1806 to 1829 Toryism held office, on condition of maintaining the old bigotry, which made a third of the people, on account of religious tenets, the enemies of the State. It then yielded to fear what it had denied to justice; but, more fortunate in its defeats than in its victories, its concessions in 1829 came in good time to remove the occasion for revolutionary disturbance, when Europe was convulsed in 1830. Unthought, however, by the reflection from abroad, in almost universal disturbance, of the mischief resulting from its principles, it resisted the reform which a progress in material wealth and political knowledge made indispensable. The subsequent restoration to place, when it again presumed to raise its head after that shameful defeat, was only to concede, in spite of many years of protestation and resistance, great commercial reforms, the abolition of the corn laws, and to acknowledge the thoroughly anti-Tory principle of free unrestricted competition as the law of social life.

Less fortunate than its spiritual allies, Toryism has always been

obliged to appeal to facts for the confirmation of its doctrines, and facts have, for upwards of forty years, convicted it of being continually in the wrong. Naturally, the multitude has separated from fiction and falsehood. Workers can only live by observing and obeying facts; and between their minds and Toryism affinity is impossible. They necessarily repudiate error wherever discovered. This is the true explanation of the decay of the Tory Press. It has continually advocated error and wrong, and has fallen, and continues to fall, into disrepute. It has tried to thwart the dictates of the senses, and has necessarily been defeated.

The *New Quarterly* admits that "journalism is essentially a commercial question;" that "there is no occasion to resort to a system of subsidies to support the press;" but if newspapers can only succeed by being bought by the public, they must supply the public with what it wants. According to the confusion of the Tories, the public does not want, will not have, will discard and condemn to obscurity, then and their doctrines, because they persist in advocating what is false, wrong, and mischievous. It is supposed, however, that journals can "judiciously prepare the public mind;" that the "dread journals owe their pernicious influence" to the skill with which they are written, and that the Conservatives may, whatever doctrines they teach, if they only teach them skillfully, recover their dominion over the multitude. This is an error. They had for years all the resources of the State at their disposal; the wealth of the Church, and the emoluments of the law, were almost exclusively theirs; most of the landed property was in their hands, the press was entirely under their control; and yet they were compelled to abrogate their most cherished enactments. They could not keep opinion bound in their chains. They could neither bribe nor awe the multitude. Facts were more powerful than theories. Nature abhors political conservatism; she is ever on the life of change and progress, and whatever would withstand her, she drives away.

The whole theory of Conservatism, as presented by its journals, is founded on a false assumption. It starts upon the principle that the mind—that opinions can be manufactured to order,—that right and wrong, falsehood and truth, good and evil, are subservient to political systems, can be modelled by them; and that it is only necessary for Conservatives to open their purses, buy and distribute Conservative journals, to make the multitude conservative. They fancy that the Emperor of the French makes the opinion of the French, and they sigh for his power. Their present complaints are a refutation of their own theory; for they have tried all human means to preserve their dominion over the mind, and have failed. The history of the last forty years is not theory, but a fact; and it ought to convince the Tories that opinions concerning all material and social objects are not formed nor regulated by journalism. The most successful of the journals, according to the Tories, owes its success to conforming to public opinion, without claiming to model or direct it.

We should not have occupied ourselves and our readers with the dolorous cry of our contemporaries—for we have no pleasure in witnessing distress,—but the avowed decay of Toryism which it acknowledges is a great fact in the history of society. It is not merely the dying out of a party—it is the sinking into oblivion of a worn-out principle. An old rule of action is disappearing, and a new one coming in its place. The knowledge of the many fashions the minds of individuals, and they cease to respect in proportion the dogmas of the ignorant few. A necessary development has given information to the public. They see who make railroads, cultivate the fields, and import luxuries, and they discriminate between their real and their pretended benefactors. They are as ready as ever to obey, but the authority they respect is different. They must be convinced that obedience is right. They glide with satisfaction into all the regulations of the rail,—they obey, with infinite readiness, the captain of the steamship,—they readily pay the taxes, which, they suppose, are required for the preservation of the public credit or the security of the nation; but they repudiate as mischievous all unnecessary restrictions. They see that freedom, which is the law of nature, is far better than coercion, which is the essence of Toryism.

THE INTOLERANT "ISMS."

GREAT BRITAIN and the United States are the paradise of the "isms." The only "isms" that we hear of on the European continent are despotism, Roman Catholicism, patriotism, and republicanism;—the two first of which are engaged at this moment, as they have been ever since 1789, in a desperate feud against the two latter. But in our land and in America, the "isms" are more abundant, and include Abolitionism, Teetotalism, Vegetarianism, Sabbatarianism, Educationism, Puritanism, Memorialism, Socialism, Puseyism, Pugilism, Mormonism, Owenism, Fourierism, Spiritualism, and a whole host of others, more or less social or religious. Once a year a social section of these pseudo-philosophers hold high revel in some principal city of Great Britain, where the soldiers of the multitudinous army of the "isms" display themselves, and disport at their wild will, to the amusement of onlookers.

The great characteristic of all the "isms" is intolerance. The

believers are not content with the quiet enjoyment of the faith that is in them, but must ride full tilt against Law, Government, and Society, if these will not succumb to their rule, or acquiesce in their teachings. Take, for instance, Teetotalism, clamouring for its Maine liquor law. Its zealous disciples, not satisfied with their own liberty to drink nothing but cold water, hot water, or even salt water, if they prefer it, insist that there is no virtue possible in the world, unless it be fluted upon water; and would enact summary laws to prevent or punish the drinking of any other liquid. But if it be free to Adam to drink of the fountain, why should it not be free to Noah or to Timothy to drink of the juice of the vine? This is a question that teetotalers never ask. They believe themselves to be right, and the rest of the world to be wrong; and, like all men who have a faith and a conscience, they are impatient of contradiction, and only need the power to be as intolerant as the Inquisition, or any other persecutor who ever bowed a dissent at the stake, or hung, drew, or quartered a man for heresy.

The "vegetarians, with their "ism," though smaller in number, are not weaker in arguments than the teetotalers. There is as much to be said in favour of vegetables for food as there is of water for drink. If, in the estimation of the one sect, misery flows from claret or gin, misery, in the estimation of the other, flows from mutton chops or sausages. The mischief is, that those who consider all virtue, manliness, patriotism, honour, and health to reside in potatoes, cabbage, and carrots, will not allow the same liberty of opinion to those who believe that beef, mutton, pork, goose, turkey, chickens, and lobsters are equally provocative of the *mens sana in corpore sano*. Full of intolerance, they invoke the aid of law to uphold their opinions, just as Calvin did when he burned Servetus.

Among the other "isms" is a sect of Sabbatarians, in the far north, who would not only stop cabs, omnibuses, and railroad trains, but would prohibit cooks and waiters from pursuing their worthy callings on the Sunday,—who would put an end to all the locomotion and feeding of the other six days of the week on the day that they devote to prayers, forgetful of the fact that Great Britain is the country of civil and religious liberty; and that the observance of the Sabbath or the Sunday is a matter for the individual conscience, with which they have no right to interfere. There are religious people in England who hold that "the Sabbath was made for man and not man for the Sabbath." But the Sabbatarians, with their "ism," would render it penal to take a walk in the fields, or look happy, on the day which they deify and would convert England, where a different feeling prevails, into one great and lugubrious Glasgow. They clamour for religious liberty in their own case, but do not understand that others, who differ from them, should enjoy any degree of it.

The Hon. A. Kinnaird dislikes what has been called "servant-galism," and would have female servants wear a particular costume, not only inferior in quality, but different in form from that of their mistresses. But a Celtic philosopher, with a faith in the kilt, might object to Mr. Kinnaird for wearing trousers, and, strong in his "kiltism," might wish to deprive Mr. Kinnaird of his natural right of dressing as he pleased. How would Mr. Kinnaird like such interference with his liberty? And is not a servant girl as much entitled to please herself as he is?

These various "isms" are the growth of freedom of opinion; but there is scarcely one of them that would not do violence to its origin. Nature and Revolution devour their children; but the "isms" would devour their mother, Liberty. There are no "isms" in despotic countries; and if our social philosophers, each with his crochets, would but reflect on that fact, and be thankful for the freedom which they enjoy to broach and to discuss what theories they please, they might perhaps rely more upon common sense, and less upon law, than they now do. The world, which is large enough for their liberty, is surely large enough for the liberty of those who do not agree with them.

A NEW AMERICAN CONFEDERATION.

WHILE the Prince of Wales is creating a *furore* of curiosity, impertinence, and applause among our ultra-democratic, but, at heart, aristocratic cousins of the United States, it may be worth while to recall to mind the effect produced by his happily-ended, but not always happily-conducted, visit to Upper and Lower Canada. If the transient sojourn of His Royal Highness in British America had no other value, the demonstration it afforded of the great fact that Republicanism, with all its vauntings, has made no great headway, except in the United States, could not fail to render it highly gratifying to the people of England. The visit is, moreover, a very sufficient answer to much that home politicians of a certain school are wont to affirm with regard to the loyalty and attachment of colonists to the institutions of the mother country, and to the frequent iterations that the value of the connection is not equal to the cost. Whatever may be the future policy of Great Britain with reference to her American dependencies, we have at

least the satisfaction to know that the allegiance and affections of our fellow-subjects and countrymen, who people them, have not been contaminated by the proximity of their faster-moving cousins; and that, if we wish to retain these extensive possessions, the power to do so is in our own hands. These provinces now contain five millions of people. Our policy has hitherto been calculated to keep them separate—so separate, indeed, that in some instances one territory has continued to muleet another, immediately adjoining, of a duty upon its products. Recently, it is true, a greater amount of local freedom has been permitted, and the colonies have now nothing to complain of in the shape of imperial restriction upon their intercourse. The consequence has been the removal, by the local governments, of such absurd and unnatural impositions. Still the provinces of Newfoundland, Nova Scotia, New Brunswick, Prince Edward's Island, and the Canadas, are, to all intents and purposes, strangers. These people, having, in the main part, one common origin, and acknowledging one common nationality, are, from early operating causes, still kept apart, and their interest made distinctive, if not antagonistic. That there is no great wisdom in this, is perceptible enough to the more considerate of the colonists themselves, as well as to their very astute and far-seeing neighbours. Concomitantly it is seriously disadvantageous. Nationally it possesses all the elements of weakness; and in the case of strife would endanger the possession. The time appears to have arrived when the Imperial Government should look to the better security of these important dependencies. As they at present stand, they are at the mercy of any powerful aggressor. It is not to be supposed that at this day an assailant could devise no other strategy than to take his ships up the Saint Lawrence for the purpose of having them blown out of the water by the guns of Quebec. What was done at that point one hundred years ago would not be attempted now in the same form, nor are the conditions the same. The strategic phase, however important in the government of a distant possession, is hardly that which now calls for the solicitude of the statesman upon whom should fall the duty of perpetuating British sovereignty in North America. A more successful experiment is not to be found in the history of government than the imposition of self-government upon the colonies. The responsibility thus created has undoubtedly brought a far better feeling than formerly existed. Coupled, too, with a just recognition of the colonists' rights to the privileges and honours of the citizen, a sense of inferiority is removed, and the attachment to the parent state has no longer the alloy which neglect and depreciation could not fail to engender.

There can be little surprise that Canada should be the foremost in any movement having for its object a new political or social existence. The united provinces of Canada contain three millions of people; and if among them the standard of education is not so high as in England, the diffusion of intelligence is far more general, more especially of that peculiar intelligence which may be termed democratic—a knowledge of the respective duties of the governed and the rulers. A population already numerous and rapidly increasing, so circumstanced, are not likely long to overlook the cause of any permanent or existing disadvantage. This sentiment has led them to detect a weakness in their present status, and they are unquestionably casting about, as men under uneasy circumstances are wont to do, to find some remedy for what they feel to be an evil. It is always better to acknowledge the ill than to attempt to disguise it. An honest admission of its existence is the true road to a dispassionate and calm solution of a difficulty. This conviction appears to have led the people of Canada to the consideration of the relative position of the whole of the British North American provinces. This consideration has been superinduced by the ill-considered working of the present union. It is useless to deny that the people of Western Canada are not well content with their present partnership, and they suggest a remedy in a Federation of all the Provinces. They assert that such a federation, while void of any of the inconvenience and injustice of the now existing union, would necessitate an identity of interests, and give a nationality to the whole. As it is not suggested to make a legislative union, it is presumed that the jealousies arising under the present system would no longer be called into existence. There certainly are many reasons why a scheme of this kind should find favour with those who are discontented with the Canadian union as it now exists; and it is therefore not surprising that it is universally popular in the western provinces.

About two years ago, Mr. Galt—not then in the Ministry, but now the Minister of Finance, and one of the most able men of the present Government—brought before Parliament a plan of confederation. That this gentleman is now a leading member of the Cabinet is a tolerable assurance, if there were no other evidence, that the Canadian Government is not unfriendly to the project. It would seem to promise great advantages to the smaller provinces of the east, connecting, as it must, these with the grain sections of Upper Canada and the north-western states. It is doubtful if the consummation of this Federal Union is anything more than a question of time. All these popular questions require a certain amount of discussion preparatory to their partition, and of this, if comment and debate indicate its approach, the advent is not far distant.

THE LAW OF REAL PROPERTY.

LORD ST. LEONARDS succeeded, during the late Session, in passing an act "further to amend the law of real property," as its title describes it. As his lordship was also fortunate enough, in the Session of 1859, to pass an act with a similar title, it is evident that he, as the champion of real property law, is doing all in his power to fortify his citadel against the future onslaughts of Sir R. Bell and Sir H. Cairnes, whose proposed measures of registration of title were obliged to be postponed in consequence of the dissolution last year, and the immense quantity of business engaging the attention of the House during the past Session. Lord St. Leonards certainly exhibits the tact of a good general in thus depriving his opponents of any objections to the present state of the law, generally acknowledged by the lawyers themselves to be well founded. They, at least, are wise enough not to postpone timely and judicious reform, and, by so doing, endanger the main part of their interests. Their policy is to reduce their adversaries' ammunition as much as possible; and, doubtless, they think that the fortress will be sufficiently strong to resist the little that will remain when the day of conflict shall arrive.

As the Acts of Lord St. Leonards are of considerable importance, it may not be altogether unprofitable to give an outline of some of their main provisions.

First, with regard to leases. Formerly, when a tenant was prohibited from sub-letting the premises, or doing any other act specified in the lease, and was under a penalty of forfeiting his lease on a breach of the conditions, if the landlord granted him permission to do the act provided against, the permission then granted destroyed the landlord's right to claim a forfeiture for any further breach of the conditions, for which the tenant had not obtained the landlord's permission. This inconvenience applied also to the case of a release of a portion of land from the payment of a rent-charge to which the remaining portion was also liable—the release of part was a release of the whole. The law was founded on a case decided in the reign of Elizabeth, and had prevailed in all its inconvenient integrity to the present time. Now, happily, and thanks to Lord St. Leonards, it has at last been repealed.

The execution of powers of appointment over property, in a technical and peculiar manner prescribed in the instrument creating the power, is no longer absolutely necessary to support the appointment made, provided they are executed in the manner in which other deeds are usually executed.

Devises in trust may raise money by sale or mortgage of property charged with the payment of debted legacies, although there may be no power to do so contained in the will, if there be no other prescribed method of raising the money.

Vendors of property are now made liable to criminal proceedings for fraudulently concealing deeds, &c., material to the title, or for falsifying pedigrees.

Executors and administrators may now, with safety to themselves, distribute the effects of a deceased person, on giving notice requiring the creditors to send in their claims before a certain specified time.

Provisions have been made for further securing *bona fide* purchasers or mortgagees from the claims of judgment-creditors, by requiring, in addition to the registration of the judgment, the issuing and registration of a writ of execution.

There are many other important clauses in the acts, but of too technical a character to be understood by the general reader, who will be able to form an opinion, from the foregoing sketch, of the great improvement in the law which Lord St. Leonards has effected.

THE GOUTY PHILOSOPHER.—No. XIV.

MR. WAGSTAFF DISCOVERS UPON VALUES AND UPON SOME VALUABLES, NOT HITHERTO CONSIDERED OF MERCANTILE OR OF ANY OTHER ACCOUNT.

It has been said—

"The value of a thing
Is just as much as it will bring."

I deny the assertion. The value of some things is infinitely greater than any price they will bring—infinite greater than the means of any purchase in any market of the world. Words are such poor representatives of ideas, that when we speak of Value, we use a phrase without meaning. The value of corn is to be estimated, but what is the value of sunshine and rain, without which there could be no corn? In the same manner, when we ask what is Truth, Beauty, Wit, or Poetry, there may be fifty thousand persons who feel the answer, yet not two, or even one, who is able to express it. Sir Robert Peel asked the British Parliament—What was a pound? But no one could tell him; and to this day one half of our social philosophers and monetary doctors are at war with the other half upon this very question; and a pound, of which any schoolboy or shopkeeper knows all the secrets, is a puzzle to those who would define it scientifically. What is Value?—Who can tell? Is it a thing fixed or arbitrary? Is it physical, moral, or spiritual? Is it matter of fact, or of any creation of the fancy? Is it of the earth or of heaven, of time or of eternity?

Nature and man are at issue upon the answer. Nature says that there is no thing, however apparently small or mean, which has not some value. Man says that there are many things, both great and small, which are utterly valueless. The values of nature are absolute and eternal as herself. The values of man are as man is—transitory, shifting, and unreliable. They partake of geography far more than of mathematics, and of caprice more than of reason. Man throws his refuse into a river, and poisons himself, his children, and his grandchildren; while Nature, allowed to deal with it in her own way, would convert it into flowers and fruit, and if man would aid her, into corn and rye. Out of fifth Nature brings roses and lilies. Out of the soil where the dead soldier rots, she produces wheat that is heavy in ear. Such is the calculation, and such is the practice of Nature.

The old Saxon English says value is worth. The modern French says that to be *vaillant*, or brave and courageous, is to be of worth—worth and valour signifying the same thing. In ancient time, if a man or thing was good for any purpose of utility, either in peace or war, he or it was worthy. Our ancestors called one who had money, brains, or good character, or all three in combination, a valuable man. They addressed him as his worthship, which we now call his worship. In rural districts, when simple hard-working men see another man with better clothes on his back than they can afford, and suppose him to have money in his pocket, or at the Bank, and fancy that he has education and refinement of manners, which must have cost something to acquire, they address him as "your worship." The title, supposing it to be deserved, is more appropriate than that of *Excellency* for an ambassador, *Grace* for a duke, *Serenity* for a grand-duke, or *Majesty* for a king. In some respects the title is even higher; for, to say of a man that he has worth is better than to say that he has *Lorship*, or *Grace*, or *Excellency*, or *Serenity*. As for *Majesty*, there are many nobilities that are not majestic, if you could but see them in their night-gowns; whereas worth naked is as good as worth with its clothes on, or its crown on its head. In addition to this there is a fancy value, as well as a market worth to all things. Robert Burns the farmer, and Robert Burns the poet, put two separate and distinct values upon a daisy. To Robert Burns the farmer, a daisy was a daisy, a mere common, worthless weed. To Robert Burns the poet, a daisy was a gem of beauty and delight—worth the whole farm. He made it so before he had done with it; for the world would much rather that that portion of Dumfriesshire whereon stood Burns' acres were swamped under the Nith, than that his little poem upon the Daisy should be obliterated from books and men's memories.

The fancy value of the great Koh-i-noor diamond is estimated at two or three millions of pounds sterling. But what is its marketable value? If the Queen sent it into the City, could she find a purchaser? If she tried to pawn it, what would the pawnbroker lend upon it? There are not perhaps two persons in the world who could buy it, and they, not with their own money, but with that of the unconsenting people whom, as aristocrats, despots, and military chiefs, they misgovern. So that if a man had the Koh-i-noor for his whole property, and was compelled to part with it, that he might purchase beef, bread, and beer—the Englishman's three B's,—or food and raiment, he might, perhaps, get much less for it than for a farm of a hundred acres, or for a ship-load of cotton from Alabama or the Mississippi. Thus the Koh-i-noor depends for the greater part of its value upon an idea, and this idea there is no one to realize but a despot, who is himself the creature of an idea, and may be an emperor to-day and a felon or an exile to-morrow.

What is the value of one hundred pounds? Surely that is a fixed thing? Alas! no. Its value depends upon time, place, and circumstance. A man cannot, or will not, eat a bank note for a hundred pounds—unless he be an idiot, or a drunken sinner. But sure or insane, drunk or sober, he could not eat it in solid gold or silver, or drink it as molten metal. A hundred pounds hoarded represents theoretically and is actually a hundred pounds. To this extent it is what the French call *une idée fixe*. But being hoarded, its value decreases, and it is of no more real account to the world or its possessor than if it lay at the bottom of the deepest valley in the Atlantic or in Tycho, or any other crater of the moon. Not being hoarded, it represents physical or mental enjoyment of some kind: so much wine and mutton; so much broadcloth and satin; so much warmth and shelter; so much chair and table; so much musical or dramatic recreation; or so much clarity and philanthropy. But if representing a certain portion of these things to-day in England, it may represent more or less of them to-morrow; and in France or Germany either to-day or to-morrow may represent them in quite another quantity and proportion.

When the ship *Juno*—of whose wreck the mate, William Mackay, has written a very pathetic account—lay water-logged off the coast of Africa, her hull and deck under water, and her starving crew clinging desperately, in the intolerable sunshine, to the spars and cross-beams amid the rigging, the captain's widow (made a widow by the wreck), who had eleven hundred pounds in Bank of England notes and gold, sewed up in a little bag which she wore in her bosom, offered the whole of it to a cabin-boy for a quarter of a sea-biscuit, which, being unwell and without appetite, he had saved out of his nation. But the price of biscuit had gone up, and that of gold had gone down, at that time and in that place. Food was at such an enormous

premium, and gold at such a frightful discount, among that perishing community, that the eleven hundred pounds failed to tempt the cabin-boy to part with one square inch of his biscuit. Biscuit was as good as life. Biscuit was life itself. A sudden crier, picked out of the gutters of London or Paris, and rejected by the dogs or sparrows, would, if it had been suddenly brought among those sailors in that rigging, have been of more real worth than a year's yield of all the gold-mines of California, Oregon, and Australia.

All physical values are equally changeable and uncertain. No land in the world is of more worth than the land of the British Isles—especially in and around the city of London. But let some strong deposit abound, aided by shaks, degeneracy, effluviary, insensuous, corruption, and want of public virtue at home, convert this great empire into a tributary province of France or Russia, and what would be the value of the land of all Middlesex, and fifty other counties?

What is the value of pig? Much to the poor Irish peasant, for pig, in Ireland, pays rent. But pig is on a lower standard of respectability in Ohio, where the people, on an emergency, for want of coal, have been known to burn his carcass to make a blaze under a boiler. And what would a Brahmin give for all the hogs ever slaughtered in Cincinnati, or barreled in Cork?

What is the value of a horse? It depends upon fancy and caprice, like other physical values. It is to be estimated by its qualities either for strength, like a brewer's animal, or for swiftness, like the winners of the Derby. But when Richard III. said he would give his kingdom for a horse, a swift steed was like biscuit to the captain's widow—not possible to be valued. It was worth infinitely more than all England and Normandy besides. It was worth a human life—the life of a man who, with a horse, would have had a hope left; but who, without a horse, must die in despair, having nothing to ask of the mercy of God; and despising the mercy of man. But to come down a peg lower—What is the value of a barbers' old, worn-out, ragged, musty, dusty, feid, and unweavable horse-hair wig? In London, perhaps, two pence, or three at the utmost. But send that same article to Dahomey, and the negroes will give an elephant's tusk for it, or an ounce of gold-dust, and will clap it on their heads, or tie it round their middle instead of a fig-leaf, and strut about with the price—as grand in their own estimation as Napoleon III. at the head of his army.

Coming to values of a very different description—values not supposed to be values, until they have been lost for ever,—let us look for a moment at yonder beautiful young maiden, entering into the ball-room, rich with the riches of her seventeen years, and of her fresh hopes, and let us ask her what is the value of her nose? Penitence as she is—for her father has nothing to give her, and earns his daily bread by the sweat of his brains, at the law, or at physic, or something else,—what would she take for her nose? Ten thousand pounds? Twenty thousand? A hundred thousand? Five hundred thousand? No. There is nothing in this world that she would take for her nose. It is beyond all price. The Queen's throne would not purchase even the tip of it.

Look, again, at that fair, blooming, fresh, rejoicing widow of two years' standing, who has not yet seen her twenty-fourth birthday: what would she take for the whole set of her teeth? Her dear departed was perhaps a dealer in grocery, in broadcloth, or in cutlery; but would she give her teeth to be made a dentist? She would not. She would scorn the bargain with utterable or unutterable scorn. Well, what would she take but for one of those brilliant eyes, that unmake the hearts of men leap in their bosoms? To cast that eye out—mere dead matter!—what is the price? There is no price. She would not sell it for anything that the world can show or offer. Not to possess India and Canada—not to share the throne of Bonaparte—not for all the wealth of all the world. Wealth is a grand matter; but it is not worth the eye of a widow, or of the meekest beggar that crawls in the sunshine. And then, oh, allerman—then, oh, man of sixty years—who knowest what is what—who has a punch-bell and weakened with a superabundance of good things—what wouldst you give for the appetite which yonder curly-headed playboy sits upon the stool, eating bread-and-cheese? Fifty thousand pounds would not buy thee such an appetite. Thrice fifty thousand could not bring thee even an approximation towards such a relish for thy food. Food is in the gift of Heaven; but Heaven, though thy food be provided, will not give thee, at threescore, the appetite of enscowred, which thou hast abused, tormented, and extinguished. Offer thy worldly goods ten times over for an appetite, and thou mightest just as well offer the shadow of a farthing, or the snuff of thy fingers in the air!

Youth and Health: who, when he possesses these inestimable treasures, ever thinks for a moment of their value? What would the old man give for his youth? What would a grandmother give for her bridal hour? What would the cripple give for a sound leg?—the hunchback for a spine—like a soldier's, selling himself, spine and all, for thirteen-pence halfpenny a day? What would the blind cat give for a clear vision?—the stammering martyr for the tongue of a Billingsgate fishwife?—or the dead duke for the charm of music and song!—or even for the power of gossiping in whispers with a neighbour on the benches of the Painted Chamber? How can her Grace the Duchess tell him she loves him? She must shrink it out, or speak it through a trumpet, so that the servants may hear;—and what love is worth the having, if you are obliged to blazon it upon the house-top!

I have not yet done with the Values, and shall return to the subject next week.

In the absence of all other domestic news of interest, public attention has been attracted to the speeches and lectures delivered by leading public men to audiences of various kinds in the provinces.

A long speech on the national defence was made by General Peel, in replying to a toast at the annual dinner of the *Huntingdon Agricultural Association*. General Peel attaches very great importance to the rifle movement. He remarked that a bad shot may be a good soldier; that it is one thing to fire at a bull's-eye and another to fire into a battalion; and that, therefore, no one should retire from the corps because he could not stand high in the prize competition. No great battle was ever gained by the dexterity of individuals; victory, in all cases, being ensured by the valor of the masses, and the confidence that each places in the other. With regard to the navy, on which the defence of the country must chiefly rest, General Peel stated that by Sir William Armstrong he had recently heard the opinion expressed that if the new iron-clad frigates introduced into the French navy are found to possess the speed and to be as seaworthy as ordinary men-of-war, no other vessel will have the slightest chance against them. This being the case, the entire reconstruction of the navy will be necessary, at an expense which may be judged of from the fact that two vessels of war, now in the course of construction, will cost alone no less than a million sterling.

In connection with this subject, it appears that the authorities at Whitehall have, during the week, had under their serious consideration the necessity of building a number of iron-clad ships. They have resolved that several shall be laid down without delay, although nothing definitive has yet been settled with regard to the exact plans to be used in their construction. One vessel is to be built at the Chatham dockyard, others at private establishments, and this, probably, with a view to ascertain the respective merits of work so performed.

Parliamentary talk was denounced once more by Lord Enfield, at the dinner which followed the annual show of the *West Middlesex Agricultural Society*. He suggested two modes in which the evil might be cured: the one being, that the electors should take their representative to task when he wastes the valuable time of the House of Commons; and the other, that parliamentary reporters should not transcribe irrelevant, pointless, ungrammatical, and incoherent speeches into whole columns of good grammar and good sense.

The influence of reformatories and ragged schools in diminishing crime has been treated of with all the new light shed on the subject in recent discussions, by Mr. Hill, the recorder of Birmingham, in his charge, delivered on Monday last, to the grand jury of the borough quarter sessions. The fact is now established beyond all doubt; he says that juvenile reformatories have diminished crime to an extent which should secure for them the warmest public support. If, he argues, it is found that instruction and training qualify the recipient for the performance of his duties as a member of society, thereby reducing to a minimum the expense of governing him, then and so far education should be considered a part of government itself. Where the right of tuition cannot be extracted from natural sources, in it not self-evident that it should be furnished by the state? He united "his humble protest to the masterly speech of Sir John Pakington in Parliament, the fervid appeals of Dr. Guthrie, and the unanswerable remonstrances of Mary Carpenter, against the huckstering frugality with which our ministers let go their coin shilling by shilling to the ragged schools—a parsimony which, when contrasted with the plaintive of their usefulness in favour of classes of the community able and willing to contribute to the education of their children, struck him as the most astonishing example of inconsistency which had occurred in his time."

The disturbances at St. Georges-in-the-East have again broken out, in spite of the efforts made by the Bishop of London to put an end to the fooleries which in the first instance provoked these disgusting scenes. Mr. King, the regular clergyman, has now retired, and is replaced by Mr. Hammond, a minister of moderate opinions, who for some weeks past has been allowed to conduct the service in a comparatively quiet manner. The "Anti-Psueyite League" are not, however, satisfied with the change which has taken place in the mode of conducting worship. Accordingly, on Sunday last, not only the reading of the service, but the sermon, which was altogether free from allusion to any subject in the most remote degree connected with Psueyite tenets, were interrupted by coughs and hisses, and a repetition of the other proceedings on the part of the audience which shocked and scandalized the public some months ago. As there is now no valid excuse for the perpetration of these enormities, it is to be hoped that the magistrates will punish the offenders in a manner which will bring them to a sense of the folly and blackguardism of their conduct.

His Royal Highness the Prince Consort, on the 1st instant, had a narrow escape from what might have proved a very serious accident. Returning alone, in the afternoon, in his carriage, from Catterburg to Colong, his horses, which were driven four-in-hand, began to kick violently, and then started off at full speed. At a distance of about a mile from the town, they reached a level crossing, where the highway passes over the railway. A train being expected, the gate was closed, and a wagon was standing in the road. Seeing that a collision was inevitable, his Royal Highness, with great presence of mind, jumped to the ground, and escaped being stunned or seriously injured, although slightly out of the face. The driver was less fortunate. He remained on the carriage, and was violently thrown when it came into collision with the bar, and severely injured.

MONEY AND COMMERCE.

The demand for money has increased this week. In consequence of a considerable sum of gold having been taken from the Bank of England to supply the Bank of *Escompte* at Paris, a little apprehension of scarcity begins to prevail. Caution is induced, and money is secured, to be ready against contingencies. The Bank of *Escompte* has been fully authorized to establish branches in the East, with a view of making French trade as much as possible independent of the London and Eastern banking companies. It requires, therefore, to send a considerable sum to China, to enable it to meet the wants of commerce, and probably, also, the wants of the French expedition. Again, then, the flow of silver to the East will increase, and gold goes hence to France in advance of what we usually send, as we generally export gold to France, in order that purchase silver to be sent to China. The total amount of gold to be so sent away is, however, only £500,000, and this would occasion no uneasiness were the Bank of England otherwise in a very favourable position.

The Bank returns last week, however, showed a decline in its resources, partly in consequence of the commencement of quarterly payments on account of the Government, and partly in consequence of the demands of trade. The returns of the present week will no doubt exhibit, from the same causes, a further decline, though they will not include the payment of dividends to the public. Those who watch such matters are aware that the reserve of the Bank, — £2,391,153 last week, and £2,985,880 last year at this time, — and its resources generally, are considerably less than last year, while the demands of commerce, as represented by the private securities, are something greater — now £19,945,221, last year £19,792,356. One cause of the Bank's unfavourable position is Mr. Gladstone's plan of raking out its resources by drawing on the Government balances in the Bank; and it was noticed in the revenue account published last week, that in the quarter ended June 30th, there was no surplus balance whatever in the Bank to the credit of the Government, — a thing we have no recollection of ever having seen for England before. At present, accordingly, the public deposits in the Bank are only £6,832,025, while at the same period of the quarter, for several successive years, they have not been less than £8,242,217. The vast amount of money which the Government now spends, is attended with the obvious disadvantage of lessening the resources of the Bank — the only body which can create legal tenders — and hampering commerce. Money, or legal tender, being now unusually limited in quantity, will, most probably be dearer.

Messrs. Overend & Gurney have some reference to the real transaction for which they are drawn. The object is to prevent bills being offered for discount which are not drawn against goods actually on their way to the market, and is so far good. There must, however, be some difficulty in verifying each transaction, and in ascertaining at all times whether the goods will be equal in value to the credit taken on them, and whether any other credit has been taken. After taking all possible precautions, the discounters will have to rely, in a great measure, on their customers, and it would be better to make the reliance on them entire and complete. The true source of credit is confidence in an individual, and it would only be logical that this principle should be relied on throughout. If the individual created by a region, he will find out means of obtaining his region's ends. Men, too, in a large way of business may want temporary accommodation without having any immediate transaction on which to base it.

A bill drawn on this account will be truly an accommodation bill; and if the man be trustworthy, he ought to be able to obtain it without rendering an account of what he immediately wants it for. All bills, as a cotemporary has remarked, are for accommodation, or why draw them? Why not hand over the money? To make a distinction between bills which a man draws on some one transaction, and those which he may require to draw without the possibility of using them for any single transaction, will be in practice very difficult. Of course, all credit is based on value in future, and whether a man be justified or not in taking credit, turns on his judgment and discretion. We believe, therefore, that discounters would be much safer were they to make discounting depend entirely on the character of their customers, rather than on written evidence of their special transactions.

The corn markets generally continue about the same as last week. In other markets, too, the alterations are unimportant. They have been dull rather than otherwise.

The Funds, and with them Railway Shares, have gone decidedly backwards, more, we believe, on account of the rise in the value of money, which increases the danger of speculation for the account, than from any political cause, though the affairs of the continent, in consequence of the movements of the Emperor of Russia, have been more uncertain. The fall is chiefly speculative.

The money price of Consols is about 92.

It has been remarked that since July last the average rise in the value of railway property has been 5 per cent., while the average fall of public funds in the same period, has been about 2 per cent. This course, as we indicated long ago, is a healthy one, the property, earning something, is increasing in value, while the indolence of the State is declining in value. The *Times* estimates the nominal gain from the rise at £16,000,000, and the loss from the fall at £16,000,000. Without guaranteeing these proportions, the continued rise in the value of railway property, both here and in the United States, is justified by facts, and is very gratifying. It is, however, due entirely to the increasing commercial traffic, the line connecting with the rest of the world being more prosperous than those connected with places which are chiefly sought for pleasure.

The iron trade is flat, notwithstanding the improvement in the French tariff. A liberal tariff issued by the still nominal, but really orking of Naples, has just reached this country. As its authority cannot give effect to it, its only value is the testimony issuing it bears to the progress of free trade.

MEN OF MARK.—No. V.

FARADAY.

CONSIDERED as an element of society, the man of science is peculiarly circumstanced. To be admired, he must be appreciated; to be appreciated, he must be known; to be known, he must be understood. This latter assumption presupposes the public to be scientifically educated, which postulate we very rarely deny. The public are not scientific, in any parallel sense to that in which they are literary or artistic. The capacity of admiring a work of art, because it is a work of art, is at this time not rare. The capacity of admiring poetry or fiction, because of the pleasure they confer, is of very general occurrence; but if we come to investigate the nature of popular scientific taste so-called, it will be found usually to represent some secondary or independent idea which once grasped, the scientific origin and connections of it are forgotten. The scientific mind, in its highest type of development, is characterized by the love of investigating natural laws, because they are laws, and irrespective of any personal advantages which may accrue from the investigation. Such is the impress of the true scientific mind; but there is a mock similitude, and one should be aware of it. Very commonly does it happen that the walks of science are entered upon as a road to fame by individuals in whose organization the true incentive to scientific culture is wanting. Fame, and social distinction—the goal of fame,—being the inducement held out to such pseudo-votaries of science, they aim at securing for themselves the rank of abstract thinkers, without the possession of mental characteristics sufficiently exalted, or motives sufficiently pure.

The term abstract science is very inadequately understood. The pretenders to high science, of whom we have just spoken, affect to disengage all scientific knowledge which finds immediate application to the needs and wants of man. The pretender to high science speaks of utilitarianism as though it were a demerit, seeking by this foolish depreciation to bespeak his alliance with a superior order of minds. This is the quackery of high science, not the reality of it; a feeling that will begot naught save contempt in the mind of a true philosopher. Abstract science is not so much science incapable of being applied to the wants and conveniences of man, as science the application of which is, for the time being, not obvious. Were it possible for the real philosopher to assume that some particular law had been impressed on matter uselessly, arbitrarily—imposed by more caprice—falsely—then would the philosopher discover no sources of pleasure in the investigation of such law. Analyzed out, the true spring of a scientific man's investigations is faith—faith that every law impressed on nature is impressed for some good end. The so-called abstract philosopher is abstract only in the sense that he works not necessarily for himself or his contemporaries. He knows that truth is good because it is truth. He is filled with an exalted reverence for the destinies of life transmitted from race to race, but he heeds little the destinies of an individual.

The admission must be made that a mind attuned to this belief is prone to become unsympathetic in its immediate relation with contemporaneous humanity. Much reflection on individual smallness, contrasted with specific grandeur, is prone to engender a callousness to the things and circumstances of today. When unregulated by other and extraneous tendencies, the philosophic bent may drift the possessor of it into the condition of pure misanthropy. Of this result the celebrated Cavendish offers a marked example. He was as nearly devoid of individual human sympathies as a human being could possibly be—though perhaps no man ever lived a life of more true and unflinching devotion to the shrine of science.

Having endeavoured thus to set forth a few of the reasons wherefore a votary of high science, though appreciated in kindred circles, remains, too often, unnoticed to the outside world, almost unknown, let us try now to make apparent the causes which have conferred on Michael Faraday an exceptional position. Unquestionably he is a man of mark. "Faraday" is a name which not merely comes as a familiar sound to those who have walked in his own paths, and followed kindred avocations, but it is a word known and familiar to the multitudes of that larger outside world whose tendencies lead them in no way to the cultivation of science. The certainty of this fact came upon us with startling force the other day, when looking into a miscellaneous shop, we saw the pretentious offer of Professor Faraday's lecture the list of a tobacco-box. Yes, there indeed he was, fairly dividing honours with a wholeery of Venuses, Dianes, Turkish brivies, and other ladies of various degrees and qualities of attraction; to say nothing of male candidates for popularity in the shape of Volunteer Riflemen of all grades, and the hero Garibaldi. Of a truth the phenomenon set up as a-thinking. The fly and amber comet would have suited the occasion, had flies, like Faradays, been rich and rare. We marvelled, nevertheless, how the — he got there! Had Michael Faraday won his way into the affections of the tobacco trade by some fortuitous act of chemical special pleading? Had he got some fumbling tobacco-cosmet out of an Eschbacher scruple by demonstrating, for a consideration, that duck-leaves were tobacco-leaves? Prove this, and the appearance of our man of mark upon the lid of a tobacco-box would have been sufficiently explicable; but Faraday, almost from the time of his first entrance into the precincts of the scientific world, has totally eschewed the blandishments and popular renown, and heavy fees, of scientific special pleading.

Be the fact noted: he is never seen giving testimony within the walls of a court of law, in any case; whether civil or criminal. Probably the dictum may go forth hereafter, that, in refusing to do so, he has taken to too decisive stand, and entered too strong a protest against an abuse of the age we live in. Undoubtedly, scientific special pleading has grown into an abuse. Undoubtedly the parallelism sought to be established between the functions of the barrister who defends the thesis of his brief, and who must not travel beyond the records of that brief, is a false and disconcerting parallelism. Undoubtedly it is full time for the position to be recognized that the only brief a scientific man should hold is the book of Nature's brief, open it where he may; a maxim

which, forgotten or spurned, has wrought much damage to the character of scientific men. But it may be argued, nevertheless, that the sentiments of disgust for this abuse, should not drive men of science from courts of justice altogether. A protest is wanted, and men of mark like Faraday are every way suited to make that protest. A very self-sustaining protest he has made in altogether repudiating that fruitful source of wealth which comes from judicial and commercial retainers. No, depend upon it, though the evidence of all past tobacco disputes be not at this moment before us, Professor Faraday did not get advanced to the position of a man of mark in the tobacco-trade's Wallalla, installed amidst a hazy of fair nymphs and renowned warriors, through the recognition of services of this kind. We must seek the cause of his popularity through other channels.

To increase the difficulties of him who would trace the cause of Faraday's popularity to its source, our philosopher is not to be termed a convivial man. He is not a disconcerting though seemingly a man who would be merry enough at the dinner table. Faraday loves a joke, may laugh very heartily, and is never seemingly better pleased than when making a big, boy of himself—eluding the sympathies of children. Very sociable, he has ever avoided society: wherefore he knows better than we, whose only object at present is to show that our man of mark certainly never ate his way, or drank his way, into the appreciation of the public. Excepting court commands, to which he must needs respond, Michael Faraday is nearly a recluse. Far from courting aristocratic circles, Faraday has ever shunned them. Independence itself, he lacks not courtesy; and was ever known to maintain that somewhat difficult position of vindictive, with ineffective delivery, the claims of intellectual aristocracy, in the presence of aristocracy of hereditary rank.

Neither has Faraday won popular favour and recognition by pandering to any low or meretricious scientific tastes. Though his lectures have been ever popular, the subjects of them have been ever profound. His experiments, always attractive, have never borrowed the spurious charm of meretricious display. His illustrations, devised with a meaning, are carried out with precision and address that would enhance the reputation of a professor of legerdemain. As a manipulator, Faraday has always been unrivalled. His back on chemical manipulation is unique for as far as it goes, which was as far as chemistry, at the time it was written, had reached possible, or desirable. That some author has not similarly dealt with the intricacies of chemical manipulation down to the era of organic analysis, is to be regretted. To needless manipulation Faraday is indebted for much of the charm which attaches to him as a lecturer, and in some way or another the position of mark which he has achieved for himself is due to his lecturing capacity. None who have heard him lecture will deny that, as a lecturer on popular science, he stands alone, at an immeasurable distance from all competitors. As an author his pre-eminence is not so great. His literary style is open to objections. His sentences are long; needlessly qualified sometimes; and occasionally involved.

These characteristics are the more unaccountable, seeing that, as a lecturer, Faraday is so natural and uncontrived. The desire of giving conscientiously to all things, is ever present to the mind of Faraday; and to it, we believe, is attributable his defects of literary style. For would he would not propagate a falsehood; he therefore weighs his words so deliberately, and tempers them in writing with other words, but they should pass for too little or too much, so carefully, that a sentiment akin to pendency is suggested to the reader. In lecturing, this over-conscientiousness cannot take effect. Always master of his subject, and speaking extemporaneously from the merest jottings of notes, the lecturer's fluent tongue and nimble hands respond to first ideas, as they come welling up fresh from their sources. Regarded as a philosopher, for what he has done in scientific walks, Faraday's name will be revered by kindred minds until chemistry, magnetism, and electricity are forgotten; but, considering him in relation to his widely-diffused social fame—considering him as a man of mark—it may be otherwise. When Faraday shall be dead and gone, and the memory of his oral teachings shall have departed, non-scientific posterity, it may be, will seek vainly to discover the secret of his present social fame and extended influence. It is to be regretted that Faraday fears to recognise the spoken language of his ready thoughts as worthy a permanent record in print. That language would be of peculiar interest, but very charming. If the mere titles of Faraday's lectures were all collated, posterity would routine them in vain for any cause or topic of general interest, or popular sympathy. A sympathetic chord, nevertheless, the lecturer manages to thrill, whatever be the subject of his discourse. More than, perhaps, any other philosopher, he connects the elemental laws of nature with some dominant idea capable of awakening human sentiments and affections; thus not infrequently dividing with the painter and the poet the domains of emotional feeling. Scientific discourses, for the most part, are addressed to the head; a lecture of Faraday's goes direct to the heart. Commands not proved in school have experienced this charm without ceasing to analyze the nature of it. Apart from the cultured or suggested sentiment, the general topics of Faraday's discourses would not be of themselves popularly interesting.

The mind of Faraday is eminently suggestive. It opens out new points of vision and of retrospect, from which beheld, the domains of science are seen under new phases, and made to disclose new lights. In this capacity, Faraday is unrivalled; but the new point of view being indicated, many contemporaries are better fitted than he to exhaust the treasures there waiting to be disclosed. An analytic mind, it is deficient in the cultivated resources of analysis. Even as regards analytic chemistry, Faraday never went very far, though the little he has done in that department bears the stamp of truth. That language would be of peculiar interest, but very charming. If the mere titles of Faraday's lectures were all collated, posterity would routine them in vain for any cause or topic of general interest, or popular sympathy. A sympathetic chord, nevertheless, the lecturer manages to thrill, whatever be the subject of his discourse. More than, perhaps, any other philosopher, he connects the elemental laws of nature with some dominant idea capable of awakening human sentiments and affections; thus not infrequently dividing with the painter and the poet the domains of emotional feeling. Scientific discourses, for the most part, are addressed to the head; a lecture of Faraday's goes direct to the heart. Commands not proved in school have experienced this charm without ceasing to analyze the nature of it. Apart from the cultured or suggested sentiment, the general topics of Faraday's discourses would not be of themselves popularly interesting.

The mind of Faraday is eminently suggestive. It opens out new points of vision and of retrospect, from which beheld, the domains of science are seen under new phases, and made to disclose new lights. In this capacity, Faraday is unrivalled; but the new point of view being indicated, many contemporaries are better fitted than he to exhaust the treasures there waiting to be disclosed. An analytic mind, it is deficient in the cultivated resources of analysis. Even as regards analytic chemistry, Faraday never went very far, though the little he has done in that department bears the stamp of truth. Commands not proved in school have experienced this charm without ceasing to analyze the nature of it. Apart from the cultured or suggested sentiment, the general topics of Faraday's discourses would not be of themselves popularly interesting.

Altogether, perhaps, this deficiency is not to be regretted. It may be that the very absence of mathematical power entails what we may call the sentimental aspect of Faraday's mind, and establishes a firmer bond of union between the domains of mere science and the common sympathies of humanity.

Having, on many occasions, been charmed with the peculiar turn of suggested thought which is so much a characteristic of Faraday's style of lecturing, we shall be expected to furnish an example. The following may be selected out of many. Lecturing on the non-metallic elements, some years ago, he took occasion, by a perfectly natural transition of thought, to elucidate the obvious, though not often contemplated fact, that the normal state of all matter is transition-motion. Chemistry—sometimes regarded as the science which illustrates the properties of matter at rest—has ceased to yield up evidence of all-pervading motion. The most seemingly permanent of elements and their combinations are ever on the move. Force cannot be abolished, though it can be masked. Nature tolerates no stagnation. The mountains disintegrate, and are disintegrated. Crystals are aggregating, plants are springing up. Animals are born, only to die and yield their tormented elements to other forms and further destinies. Nothing is at rest. Diverging from this poetic vein of thought, he next showed the beneficence of that Ordaining Power which had so willed, from the first, that elements should normally aggregate and constitute forms beneficial to the general interests of created life. He sketched ideally the desolation which would have ensued had phosphorus and chlorine, for example, existed free, or in harmful combination, instead of being fettered into harmlessness in the state of bone-earth, and common salt.

And thus the lecturer succeeded in denoting a chord of sympathy in close relationship with the human heart; showing how, outside, and beyond the sphere of material forces, there lies a power ever mindful of the wellbeing of the created world.

Faraday is, perhaps, the most emotional of philosophers; yet his emotions are never inappropriately indulged. In his own mind he has long ago settled the point where things to be scrutinised inductively end, and things to be accepted on faith begin. This condition of mind is no less averse from the error of supple-menting faith by inductive experiment, than from the opposite error of importing a blind credence into the realms of discussion, properly to be settled by experiment alone. The mind of Faraday is essentially a sound and healthy mind. This was well exemplified by the part he took in reference to the table-turning and spirit-rapping deluge. Human knowledge is never more endangered than by the experimental testimony of persons unaccustomed to the performance of experiment. The first characteristic of an experimenter, as Liebig some time ago pointed out, is self-honesty, freedom from bias in the direction of preconceived notions.

The capacity of experimenting with perfect honesty to oneself is rare. Instead of proceeding from experiment to conviction, table-turning enthusiasts took the opposite course. Starting with convictions, they saw, in the results of experiments performed, a confirmation of their belief. So soon as Faraday set himself to investigate the conditions of table-turning, he placed the defenders of it in this dilemma. "The motions of which you speak (said he) are referable to some physical force, or they are not. If the former, they are proper subject for experiment; if the latter, let us at once confess them to be supernatural—demoniacal." Granting, for the sake of argument, the reality of the phenomena—choose your ground. Are you content to defend their reality by recourse to experiment, or do you choose to ignore the results of experiment, and stand on faith alone? A mixed position you cannot take. Experiment or faith—which shall it be?

The course adopted, the issue agreed upon, and the result, are well-known. Faraday, having brought the phenomenon of table-turning within the scope of experiment, by consent and agreement, soon demonstrated it to be the result of muscular force unconsciously put forth, under the suggestion of a leading idea.

A somewhat melancholy shadow now comes over us. Faraday has attained the normal limits of the life of man, and there is none like him. Speaking according to the lights of humanity, he will no long time hence become. Few spirits more pure or holy than his will ever have soared heavenward from this far microcosm. For himself—like a philosopher so he is—we know Faraday to be waiting in tranquil reserve for what comes next. On his behalf we would not give expression to the regret, much by him, that the days of his busy career amongst us must be so few. But on behalf of the Royal Institution, and science, and the public, who through science have been charmed by Faraday, though often unknown to science and unknown to it—also for them?

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

GARRIBOLDI has been fully restored to the good opinion of his friends, and the friends of Italy, as I supposed he would. It is well that even the cavaliers and false friends should be satisfied. He has risen higher than ever, both as statesman, patriot, and general. He has shaken himself free, too, from many of his old friends, when he saw that their interference was mischievous, and their actions subject to misconception.

I was right last week when I said that Victor Emmanuel would immediately put himself at the head of his army, and march into the South to join the victorious ranks of Garibaldi. He has already done so. Still every eye rejoices that the General had time to put himself right, both in a military and political sense, before the arrival of the King. I am now just enabled to inform you that the Turin Chamber voted the law of annexation yesterday by an overwhelming majority, and the votes of the inhabitants, both of Sicily and of Naples, will be taken without further delay, so soon as the ex-king, and the remnant of his garrison at Messina and at Gaeta shall be removed.

I much fear that we have to deplore amongst the losses in the last battle the correspondence of one of the morning papers, whose zeal led him to the front. The correspondent, whom many friends in England will lament, is not an Englishman, but a Lombard noble, who was well known in London for his amiable and unobtrusive disposition during his exile in this country.

The death of these three great Powers at Warsaw will be a very significant one, and is intended to exercise a considerable influence upon future events. But it will be confined to a defensive policy. The days for holy alliances are at an end, even in continental Europe. There is no party in England, at all events, who would be mad enough to repeat the exploded policy of Castlereagh—nor would it be possible, if necessary, for France to repeat the perfidy of Laybäck, or Campo Formio. The explosion of Italy will, therefore, be kept within its proper limits; and the Italians seem to have acquired wisdom, as well as patriotism in the management of their own affairs. Hence is the interest of universal Europe, and the "idea" of Italian unity is now in a fair way of being carried out.

This country seems to go on well, without being misgoverned, whilst the three estates of the Realm are out of town, and we are literally governed by the fourth, whose rule is more mild and easy than usual. The Chancellor of the Exchequer has returned to town. Lord Napier, who has been in London during the last three weeks, has refused the Governorship of Madras, after full consideration. It is found that, by accepting it, he would lose his diplomatic standing, in which he has earned so good a position. It is also said that Mr. Laing hesitates, on the score of health, to succeed Mr. Wilson in the Council of India; but, I believe, nothing is definitely settled respecting the new Chancellor of the Exchequer for Calcutta. The place is also said to have been offered to the Right Hon. R. Lowe, and to Mr. George Arbuthnot, of the Treasury, the able auditor of the Civil List. It is now rumoured that it will fall to the lot of Sir Stafford Northcote, Lord Derby's financial secretary of the Treasury.

There is likely to be a sharp contest for the representation of Boston. There are already four candidates in the field, besides one who has withdrawn. There is a Tory, a Whig, a Nonconformist, and an advanced Liberal. The real contest, we take it, will be between Mr. Malcolm, the Conservative, the first comer, and Mr. Ridley, the Liberal, the last in the field. Mr. Ridley is, like the late Mr. Ingram, whom place he aspires to fill, a native of the town. He has acquired wealth by honorable industry, and manifests a disposition to spend it generously for the improvement of his birthplace. Boston is not a picturesque or attractive place, by any means; but it has charms for those who were born within sound of the bells of St. Botolph; and when a man like Mr. Ridley comes back to it, with a full purse, a good set of political principles, and a well-considered plan for the improvement of its port, he threatens to be a formidable competitor against any other candidate. The Tory and the Whig candidates seem to rest their chance of success on the not very important fact that their several "uncles" once represented the borough. Mr. Ridley seems to stand upon his own legs, and not on those of his uncle or uncles; and his chance with such a constituency as that of Boston is, therefore, all the better.

In theatrical matters, Mr. E. T. Smith has opened his Italian and his English Operas, at Her Majesty's Theatre. The old Traviata—Verdi's best—was judiciously enough selected for the opening night. Gingsini and Titens were, of course, first-rate; but Madame Lemaire was a poor substitute for Graziella, in the Giuletta; and the new Count de Luna, Signor Brian, did not come up to his Italian reputation. He seems to belong to the boisterous school of Morgani, of which the provincial theatres of Italy produce so many raw specimens. There is room for improvement and tuning down.

Laurie is reported nightly at Covent Garden, and is little spoken of out of doors. There is a fresh and promising actress at the Lyceum, Miss Goughenham, from America and Australia, who has made rather a sensation in light comedy, but, apparently, not to the extent hoped for by the management, if we are to judge by the force of advertising employed.

Mr. John Brumham has come back, after a twenty years' absence in New York. He has appeared in a lively part at the Haymarket, in a farce of five acts, written by himself, in which the clever actors of that pleasant establishment are admirably fitted with appropriate parts. The piece was well received, and the author highly welcomed by his old friends.

Old Drury opens next week.

The St. James's will commence on the last week of this month. We have a host of no more additions to the company, beyond that of Mr. Keeley, who is at home in himself, and who is said to have been persuaded from his declared intention to give up the stage; and of Mr. Flanahy, who is reported as about to submit more of his refinements on the "Tales of the Fairies" to the careful hands of Mr. and Mrs. Wigan.

The "Italy Biaz" of Victor Hugo, and "Princes Corcoran" of Dumas, are performed at the Prince's by a French actor in an English dress.

Let me say a few words about Richmond Theatre. If any boards can give inspiration to an amateur, it would be found on those of the theatre Garrick built, and that were so often trod by Edmund Kean. And we believe the regular company at Richmond is occasionally recruited by an aspirant from the metropolis, wishing to try his strength in the centre of great stage traditions. A few evenings since a well-fitted horse greeted the appearance of a Mr. Taunton as Richard the Third, an amateur, we were assured, though, from his self-possession and evident knowledge of stage business, he might well have been set down as a regular practitioner. We confess to a strong prejudice against the transformed, transposed, interpolated piece of tragic patchwork we have to accept as the "acting edition" of "Richard the Third." But taking the part as left after Garrick and Cibber's improvements (which resemble the havoc of two churchwardens at loose with hammer and whitewash among Gothic tracery), Mr. Taunton dealt with it intelligently. His elocution was effective, flowing, and distinct; and he avoided the common error of giving

every passage in the "Cumbrian note," throwing in a relief by lighter tones, verging on comedy, which the audience evidently appreciated. His wailing scene with Lady Anne was a piece of very frank comedy. The text scene, with its terrors of conscience, different altogether in style, was equally well given. Mr. Taunton dressed the part splendidly, and with due attention to correctness in detail, showing something of the artist as well as the actor. As the close of the performance he received the honour of a call before the curtain. At the M. Taberny will present a French company of comedians at Her Majesty's Theatre, in the concert-room, on the 17th.

Miss Emma Stanly, at the Egyptian Hall, is about to add another to the numerous "entertainments," which Mr. John Parry and Mr. Albert Smith made so pleasant and profitable.

We are threatened with a deluge of Nigger performances, an abundance that seems to be violently on the increase. In fact, no writer on record has ever mentioned so many theatres and places of public amusement open in London. There is a good deal of scandal, respecting some alleged tampering with Middlesex magistrates in regard to the "license" of one of these projected places of entertainment for ladies and gentlemen. I shall say no more about this at present. The licensing day is fixed for to-morrow, and the murmur will probably be cut.

RURAL ECONOMICS.

AN AGRICULTURAL INTERLUDE.

Party politicians on the Tory side, who happen to be county members, commonly find it convenient to make their appearance at one or more of the agricultural associations of the counties they represent. Formerly, indeed, when the farmers were kept to the Conservative standard by illusory promises of laws for the advancement of corn prices, and denunciations of those "wicked" politicians who would permit the unrestricted importation of foreign agricultural produce, the county societies, though agricultural in name, were, in fact, protectionist political clubs, which it suited the purposes of such county members to foster. Nor have such objects altogether ceased to be regarded at agricultural meetings. In spite, however, of the best arrangements for preventing any real farmer from speaking "a bit of his mind," awkward truths are occasionally said, especially in the smaller societies; and therefore the shrewder of the county members are now endeavouring to render the local agricultural societies more completely what they profess to be, by promoting such changes and amalgamations as will be likely to produce real county agricultural societies.

Of all the county meetings who have used and abused local agricultural associations for their own political purposes, there is no one who has done so more ingeniously than Mr. Disraeli. He seems at present, however, to have no political views which he thinks it useful to communicate in the rural districts. His thoughts are purely basileic. He has taken note of the agricultural improvements of Buckinghamshire, and he ties himself down to eloquent expostulations of the advances made in husbandry by his valued constituents. Thus it was at an agricultural meeting held at Buckingham, and again more recently at Salt-hill. At the annual meeting of the Royal South Buckinghamshire Agricultural Association, lately held at Salt-hill, Mr. Disraeli took the chair, and, after having playfully tossed around some allusion to the Corn Law, the French tariff and treaty, the malt tax, and other kindred political topics, went doggedly and decisively into topics purely agricultural. His thesis was "to form a clear estimate of the result of our exertions after twenty-seven years' experience,"—being the period during which the society had existed. He considered the object had been "completely reached." That object was, "to encourage and reward the agricultural labourer and servant." This seems to have been the prelude to a suggestion that the local society might now be merged in a general county one. The Royal South Buckinghamshire Agricultural Society is said, by its "views and encouragements," to farm labourers, "to have improved the skill and elevated the feelings of all who occupy the various spheres of rural life," and Mr. Disraeli thought that the promoters of the society might "receive the reward which always attends well-directed efforts, in the consciousness that we (the promoters) have benefited the classes whose fortunes we have sought to influence."

How daring is eloquence. Fancy the influencing the fortunes of the working classes engaged in husbandry by a twenty-shilling prize to a farm labourer, who has worked for twenty years on one farm, or reared ten children without parental relief, or the like. The real purpose of the society is, in short, which, for the most part, had their origin during the anti-corn-law agitation, was to attach the labourers to the protective system their employers, the farmers and their landlords, sought to uphold. Its success was not indifferent, for the farm labourers pretty generally apprehended the fact that dark corn was by no means synonymous with more comfort or better wages, and subsequent events have satisfied them that wages are highest when industry and trade have been made free. Now such "rewards," and the societies formed for conferring them, have become simply ridiculous. So Mr. Disraeli told his audience that "it is impossible to conceal from ourselves that we live in a time which, especially as regards agriculture, is one of rapid progress, and that there is a very general feeling that the arm of operations for societies of this kind should be extended." That, in short, the society should be amalgamated with others, and show its stock and implements—the real objects of an agricultural society—established. And he recommended a South Bucks Society, which will include the bill farms of the Chiltern district, and all the county lying to the south of that line. Doubtless this advice was good, and such as would be likely to afford a real agricultural society, if the locality can support one, which is by no means certain.

Confessing himself incompetent to discuss the merits of steam ploughs and steam diggers, Mr. Disraeli "could not help arriving at general conclusions," and his chief general conclusion was, "that the agriculture of the county, and especially in South Bucks, has, during the last quarter of a century, made very considerable progress." Of course it has; else how could farmers pay the rate, and more than the rate, fixed with reference to the high prices of wheat to be under permanent for the Corn Law when actual prices have been far lower? Nor should it be forgotten that Mr. Disraeli and his party pre-

dicted ruin and loss to landlords, tenant-farmers, and farm labourers, from that freedom to commerce against which, during the first portion of that "last quarter of a century," the party so strenuously contended. As to the bill farms in South Bucks, he spoke from personal observation, that it is impossible for the stranger who comes into the county for the first time, and even through the Chiltern farms, to gather even a faint impression of their rapid progress. You find excellent crops, and not only books but numerous flocks, where they were, not long ago, unknown. You also see a greater number of new cottages, which can hardly be equalled in any other part of England; and in a part of the country where there was once the usual residence of the poor, a thatched cottage is now the exception instead of being the rule." Well may Mr. Disraeli "appeal to those facts with pride," and say "the English farmer has a great future before him;" but how much more justly may those public men feel pride in the progress made by English husbandry, who expected and predicted that progress, the result of measures which removed from agriculture the baneful influence of protection, and revealed the English landowner and his tenant-farmers more enterprising and self-reliant? After some further suggestions for accomplishing stock and implement sales in South Bucks, Mr. Disraeli said, "The career now open to the farmer is a career of the most brilliant and successful character, and a great agricultural country is no mean one. To feed every man and to feed better a great and thriving community like ours, is a very great office, and it will demand the utmost exertion of your intelligence, and the application of all the resources which an active science is placing at your disposal." Bravo, worth, doubtless. But if the farmers had spoken their own opinions, they would have kindled a sundry more potent and practical shades to the "great future" of the English farmers. There would have been talk of game damages, precarious tenures, and want of those permanent improvements which it is the landlord's province to perform.

COMMERCIAL MORALITY IN PUBLIC COMPANIES.

Is a former number of "THE LONDON REVIEW," in an article entitled "The Massacre of Public Companies," we took occasion to refer to some singular coincidences, which seemed to link together, in a somewhat mysterious manner, the names and the fortunes of Robson, Redpath, and Pullinger. We further stated that the chief auditor of the Great Northern Railway, which was plundered by Redpath, was also a director of the Union Bank, and that the same Redpath, though disclaiming the idea of attaching himself to any party, we added, that the same salacious served all the three companies plundered by these three convicts. To-day we continue our remarks upon this subject, with a full conviction that the code of commercial morality prevailing in England at the present moment, was never at so low an ebb; and that, if it is not, the financial interests of the country are in a very serious and real danger.

It has been often remarked, that up to the very hour of their detection, each of those persons noted in what is called respectable society, Redpath, in particular, has been a man who has been seen in the most exclusive circles, affected a taste for the Fine Arts, and a speaking acquaintance with lords and dukes. He had his box at the Opera, and was known well on the Stock Exchange, where his large operations secured him a welcome, as a "most respectable gentleman." In fact, all these persons, according to the received standard in such matters, were highly respectable, respectable as was John Sadler, M.P., chairman of the Royal Swedish Railway and of the London and County Bank, a Junior Lord of the Treasury, from the benches of which he smiled upon flunkies in and out of the House, who were dying for the light of his countenance; and from whence, too, he gave a generous support to the principal interests of the country, and he had been a member, until anticipating for himself the doom which was overtaking his lumber imitators, he paid on Hampstead Heath the forfeit of his crimes, impelled by the stings of a conscience at once his accuser, his judge, and his executioner. And others there have been, others may we not feel that there still are, occupying prominent positions in the public eye and in the world of commerce, men who until the bubble upon which they have floated bursts, are highly respectable too, and are worshipped accordingly, by the herd, which throngs to their palaces and gardens. When the day of sudden eclipse arrives, that same crowd will pour down upon the degraded heads of their idols the lofty contempt and indignation,—happy indeed the idols, if, ere the day of reckoning, they escape the fate of John Sadler and others.

It is to these, as a class, that all who desire the ancient integrity of British commerce to be perpetuated are interested in calling attention; for it is to these, that we have to look for the ruin of the country, the ruin of the signs, and of the men, of the times succeeding the railway mania of 1846, that the Great Britain, and her merchant princes, of the present day, are no longer what they were. Coincident with this decay of real confidence in great names, has sprung up a system of spurious mania, which, in the shape of glittering testimonies, whenever any of these names have been suspected of bad faith towards those who may have trusted them, seeks to bolster them up with inflated recitals of their patriotic services, rendered somewhere or to somebody, the presentation of which being duly emblazoned in the public journals, is forthwith vaunted as the proof that a substantially damaged reputation can be set up again by such a person, and, in short, here we must advert for a moment to other practices prevalent at public meetings of shareholders, who are less enough in their animadversions upon boards of directors, for neglect which permitted frauds like that perpetrated by Pullinger upon the Union Bank of London, and yet are themselves careless in the carrying out of their own contracts, and in the payment of dividends to these same directors, lest the present value of their shares should suffer by the assertion of a more honest, and more usually, and a more consistent course. Such conduct is enough to deprive them of all sympathy and respect, were it not also notorious that meetings of this character are managed by men who are strong enough to tamper with almost all independent directors, and who, had it been expedient, could, on a recent occasion, have carried a vote of thanks even to Pullinger himself, for having condescended to rob the Union Bank of £250,000.

Such proceedings, however, on the part of shareholders, are no more deserving of rebuke than the system of testimonial-giving we have referred to. As this sort of hypocrisy lies at the root of much of the evil

from which society, in common with public companies, is suffering, and which compromises the national character of a commercial people in its nearest and most important relations.

SKETCHES FROM HUNGARY.—No. III.

[FROM OUR OWN CORRESPONDENCE.]

COUNTRY life in HUNGARY possesses a charm peculiar to itself. With all the amenities of civilization, it combines the attractions of a certain freedom and independence rarely to be found in countries which are still in a wild and partially undeveloped condition. Under freer auspices than those which are afforded by the Austrian Government, it would contain many elements of enjoyment unknown in England. It was early in the afternoon when we arrived at S—, and our kind host determined to lose no time in initiating us into some of the mysteries of his establishment and its neighbourhood. No sooner had we done justice to an early dinner than we were informed that the carriages had been ordered, if we felt disposed to explore the vicinity. Presently appeared two open carriages-and-four, with picturesque coachmen in airy robes, their red jackets profusely embroidered and adorned with tassels, long flowing white sleeves, giving them a fantastic and half-Hungarian appearance. Behind a spirited team of half-English and half-Hungarian-bred horses, we were soon rattling along the bad road across a low stretch of pasture covered with flocks and herds to the side of a range of hills, which afforded a magnificent view. We looked back upon the country we had just quitted, and, with the aid of the high central hills, ruined castles, white cottages, and vineyards formed a charming landscape, with the broad lake stretching away to the horizon. Upon the slopes of Belascon, a mountain which rises abruptly from the lake to a height of nearly a thousand feet, is grown a vine celebrated throughout the country. In the fields the peasant is busy engaged, taking in some of the later crops. We observed, among other cultivation, the never-failing Indian corn rape, from which oil is extracted in large quantities; hemp, noted throughout Europe as the best which is produced anywhere; millet, and other grains. The peasant's dwellings are by no means the most picturesque feature in the landscape. The working-dress of the men is of the simplest nature and consists of a kind of night-gown and long boots reaching to the knee. Their hair is worn long and flows freely over their shoulders; it hangs down tank and straight, and, added to the matted beard and pendant moustache, gives a wild and almost ferocious aspect. The night-gown is exchanged for a pair of white trousers reaching a little below the knee, so wide and loose that at first sight they have rather the appearance of a short petticoat than trousers; below them are the high boots, while a short black jacket and felt hat and feather complete the costume. In wet or cold weather they wear a huge sheepskin or blasket coat, embroidered with red, and slung over the shoulder without arms. The women wear short petticoats, little jackets, and usually go barefoot. The winter dress is more picturesque: then the feet are encased in red Wellington boots, and the jacket is of untanned leather lined with fur and covered with embroidery. The women wear long and very coloured handkerchiefs. The population of the country we were now visiting was entirely Hungarian, and the costume of the peasantry varies in some degree with the nationalities to which they belong. Every man cultivates his own land, giving a certain portion of the produce of his vineyard, if he have one, to the lord of the manor, and he returns to himself all the rest of his produce, and receiving pay for all the labour which he may do for the great man. The estates of these latter are not, as with us, divided into farms, and let, but managed by intendants; thus all the farms are in the proprietor's own hands, and in some instances the property is of enormous extent. Sometimes this consists of several herds in lands, and the wealth of the noble which many of the magnates derive from this source of revenue is immense. Thus Prince Esterházy alone possesses 300,000 merino sheep, each one of which produces two pounds of wool, valued, in ordinary times, at two florins, or nearly four shillings a pound. We observed several flocks of uzerinos, and in one instance inspected the sheep, which are by no means handsome in appearance, and seem dark and dingy, until we look beneath the surface, and discover a fleece of exquisite whiteness.

On the broad pastures, watered by a stream which emptied itself into the lake, were herds of horses and of buffaloes, these latter exactly similar to those used for draught in India. Here they answer many of the purposes of oxen, and the milk of the cow is used almost exclusively for domestic purposes. The oxen of the country are a pale ashy grey, with enormous horns; they are most valuable animals for farming purposes, and we observed teams, varying in numbers according to the soil, drawing the rude ploughs of the country.

We found an ample supper awaiting our return, which was somewhat late, and had an opportunity of making acquaintance with some of the purely national dishes. The hours of a Hungarian family are very much the same as those of our ancestors, and vary only in name from those of fashionable London life. A cup of coffee and milk brought to the bedside in the morning constitutes breakfast; luncheon—called in Hungary dinner—takes place at one or two o'clock, and is the need of the day; at five or six in the afternoon, fruit, food, and preserves, correspond very nearly to our afternoon tea; and at nine o'clock, a substantial supper takes the place of our own late dinner. The cookery is altogether peculiar to the country, and is chiefly distinguished by an extensive use of red pepper and a great deal of gravy, in which, together with hashed meat, float pieces of dough. Flour is an important ingredient in many of the dishes, some of which, if more highly spiced, would not be far removed from curry.

Our kind host would not leave of our continuing our visit to one night only, and proposed, on the following day, an excursion which should give us an opportunity not merely of seeing a new tract of country, but of making the acquaintance of some of its political eminence. Accordingly, on the next morning early we again found our carriage-and-four in waiting, and were soon cutting through the bare, morning air in the direction of the extreme western point of the lake. In less than two hours we reached the little town of Csáthly, and, shortly after, leaving the post-road, struck across the country. The high-roads in Hungary are often impassable in winter; and even in summer, where the formation of the country does not

lend itself to road-making, bear a strong resemblance to ploughed fields; but they are magnificent in comparison with the cross-roads. We found some difficulty in keeping the carriages out of ruts, in some instances three or four feet deep, while, on one occasion, a ravine, at least thirty feet in depth, and as many broad, intersected the road, and forced us to go to the field at the side. A violent storm of wind destroyed one of these roads in a night. The soil being loose and sandy the torrents upon the hillsides cut it away and leave a deep gash where the road formerly passed. We struggled through the Bakker Wald by a road of this description, passing a swamp, which reminded me of those of the delta of the Mississippi, where tangled brushwood and trees cut out of the bog and render it almost impossible to find a track. The station was celebrated for containing great quantities of deer, and belonged to a monastery in the neighbourhood, the monks of which were fond of sport, and generally gave every year a grand chase, in which they invariably took part themselves.

After crossing this somewhat desolate tract, we came upon pleasant scenery, where the bottoms were heavily timbered, and large farms were dotted over the country. One of the charms of this section of Hungary is to be found in the great variety which the aspect of the landscape presents. In the Carpathians it is grand and imposing. Low Hungary is flat, and, after a while, extremely monotonous; but here the scene is ever changing. Now we pass beneath lofty hills clad with vineyards; now over a wide rolling tract bare of wood; then into dense forests or open park-like country, pleasantly diversified. Occasionally the villages are few and far between; then we come into a district where farm-houses and hamlets are seen on every part of the bog, and render it almost impossible to find a track. The villages of Hungary seem to be constructed upon principles which remind one of the monastic character of its former conquerors. They consist of broad streets, crooked and irregular, apparently laid out upon no definite system, with rows of trees planted along them, and the houses so thickly packed together as to leave no space between them. The street—presenting only, as in Russia, the gable end towards it. Round each cottage is generally a plot of ground of considerable extent, containing gardens, fruit-trees, and drying-ground for grain, &c. The houses are consequently very far apart. In Low Hungary some of the villages are situated in the most fertile and fertile soil, and are covered with vineyards, and cover an enormous area. In this part of the country, however, they were smaller and more snugly built; the cottages substantially constructed of brick, chatched in, and whitewashed. Sometimes they only contain a single room, but are usually possessed of a veranda which serves as a bed-room for the occupants, and an agreeable lounging-place always. After rain the village street is a slough, to cross which involves wading, knee-deep, through mud and water; and its extreme breadth and absence of passengers gives a desolate aspect to the place generally.

Earlier on, for days, the weather was in the fields, the women in the houses, and the dogs in the streets. These latter are by no means the most agreeable portion of the inhabitants. They are in fact the sheep-dogs of the country, almost always white, with ears that fall viciously back, curly hair, and formidable in stature. They look like young polar bears, and have an inconceivable strength and courage. They are not so much of the nature of the press of countenance, and then, when he is thoroughly off his guard, diving suddenly and secretly at the calves of his legs. The country house of the magnate is generally situated in the main street of the village, so that he lives like a sovereign surrounded by his subjects. There is a sociality about him, and he is not so much of the nature of the noble as the noble of the Hungarian aristocracy do not appreciate it, and envy us our system of isolation and large parks.

In passing through some of the oak woods, we observed a singular excrecence on the acorns, which we were informed was peculiar to this part of Hungary, and the production of the insect. It is so large and so numerous, for tanning purposes, and is a source of considerable profit. We dined at a friend's house, and, after a pleasant drive of forty miles, reached our destination in the afternoon, an unpromising little abode in a secluded part of the country, but containing beneath its humble roof a man upon whom the hopes of many are fixed at this peculiar crisis in the service of Hungary. "He brings you," in the first and most characteristic salutation of a Hungarian when he receives you beneath his roof; and you quarter yourself upon him as naturally as if he was an old friend, and you had written to say you were coming. He knows, as a matter of course, that though an stranger, you expect to find a friend in his house; indeed, he knows further, that though a stranger, there is probably no inn within thirty or forty miles, you have come with that intention, of malice prepense; and he loses no opportunity of making you feel, with true hospitality, that he is the obliged party. There is no affectation of wealth or display; if the host be poor, he knows that, and what he is, and what he is worth, he will correspond to a country gentleman, perhaps of very small means, he makes you none the less welcome, and, as a traveller, you have a better opportunity of becoming acquainted with the manners and customs of the people, by mixing with this class, than by confining your experience to the grandeur alone, to whom the traveller visiting Hungary will probably have no letters of introduction addressed.

I have found among the farmers of Hungary, a simple and unpretending hospitality as genuine as that of the first magnates; and in their homely manners have learnt as much of the real feeling of the people upon the great questions which are now agitating men's minds as amongst those who are supposed to be taking a more leading part in the events of the day. With all the aristocratic sentiment which prevails in Hungary, there is a sturdy feeling of independence, which distinguishes what—now that the privileges of nobility have been abolished—may be termed the middle class, which is contrasted with the nobles of the nation for noble and what, in fact, has been the effect of creating a great middle class, who should form a connecting link between the two extremes of society, and fuse the interests of both in a common sentiment of devotion to the fatherland. Hitherto these were so widely dissimilar, that a formidable weapon was placed in the hands of the Austrian Government by the very constitution of society itself; and

nevertheless, in some respects as good as anything Mr. Boccioni has written. The admixture of melodramatic elements with a drawing-room imbroglio is an error of judgment; and the experiment of representing an Irish lady on the stage, speaking the brogue, and sustaining at the same time the weight of a high comedy of English life, is a fundamental mistake. But, apart from these objections, the dialogue is easy and lively; the characters are well drawn, and sustained without extravagance; and the structure is solid. The piece is played very effectively at the Lyceum; and we can commend the performance to all play-goers who desire to see a comedy as well acted as the present state of our theatres will permit, and certainly put upon the stage with a luxury and refinement in the mass on some which reflect credit on the good taste and liberality of the management.

Miss Goughen's Irish brogue has been evidently studied from stage originals. We will not enter upon the question as to how far it may be possible for an actress to identify herself successfully with traits of national humour which the public have been accustomed to associate exclusively with the other sex; but we may say that Miss Goughen has not solved the problem. She has some excellent requisites for comedy: an agreeable person, a pleasant air, and a vivacious manner. But the necessity of speaking all throughout in an artificial dialect, kept her continually in such a state of rickety strain and effort as to prevent us from being able to judge fairly of her natural qualifications. Her Irish personation is not happy. She overlooks one of the essential elements of the character—sagacity proper. She is too fast, too eager to eliminate her points, too sharp, and too abrupt to fulfil the ideal of an Irish lady. We waited in vain for the witchery of the mellow voice and the soft musical intonation, the quiet fun, and the tender pathos, all of which belong to the very nature, so to speak, of an Irishwoman. Much, too, of what Miss Goughen delivered was utterly lost to the audience by that process of clipping and jerking of the words which is indiscriminately applied, with slight variations, to the stage versions of Scotch and Irish characters. We trust, however, that Miss Goughen's reputation has a wider reach, and that we may have an opportunity of seeing her under more propitious circumstances.

The cast, although it will not bear comparison at large with that of Covent Garden, is extremely good, and evinces in every scene the care with which the piece has been got up. Mr. George Vining is an efficient representative of the part originally played by Mr. William Warren; and a Mr. Neville, new to the London stage, displayed an amount of ability from which a secure career may be safely predicted, in the character formerly acted by Mr. Charles Mathews. Nor should we omit a word of recognition of the good sense and intelligence displayed by Mr. Lyon in the small part of the lawyer, and the grace with which Miss Kate Syville clothed the character of Lady Darenty.

THE WEATHER DURING THE MONTH OF SEPTEMBER.

(By JAMES GLAISHER, F.R.S., Royal Observatory, Greenwich.)

The weather in September was cold throughout, both by day and night; the sky was very cloudy; there was a great deficiency of sunshine; by rain falling nearly on every day from the middle of the month. The average highest temperature of the air daily for September is 67° F.; and very seldom the temperature reached this point. The mean for the month is 63° 4', being 4° F. lower than the average, and lower than in any September in the preceding twenty years. The nearest approach to this low day-temperature was in 1842, when its mean value was 64° 3'. The average deficiency of night-temperature was 3° F. The highest temperature in the month was 69° F. on the seventh and eighth days, and the lowest was 35° 7', on the twelfth. The range of temperature in the month was therefore 34°. The usual range of temperature on a day in September is 18°. The mean daily temperature, that is, the average of the temperature during the twenty-four hours, between the all but continuous depression of temperature in the month, points out the unseasonal character of the weather. One warm day only was experienced, viz., on the 17th; but as the range of temperature on this day was only 6° instead of 18°, and the degree of humidity was as high as 96°, it was not a fine day.

The mean temperature for the month was as low as 55° 4', whilst its average was 57° 1'. We have not had so cold a September since the year 1836, and the previous instance was in 1830.

The temperature of the dew point—or that temperature to which if the air had fallen, it would have been saturated with the water contained within it, as was the case on September 22,—the mean for the month being 50° 2', was 1° lower. There was, therefore, less water than usual in the air at this season of the year; but, in consequence of the much greater deficiency of temperature generally, the air was more than usually humid.

The average humidity for September was 81°; the mean for the whole month was 86°; so that the excess of humidity is represented by 7°.

Rain fell on seventeen days in the month, and the amount was 3.1 inches. The average for this month is 2.4 inches. The fall of rain, from January 1 to September 30, was 25.1 inches, exceeding the average by 0.9 inches.

The mean temperature of the three months ending September was 56° 5', being of the same value as in the year 1817. In this year, the temperature of July was 57° 7'; of August 55° 4'; and of September 55° 6'; and this is as far as trustworthy records extend.

The weather in the North of England has not been quite so bad as described above. It seems to have been the best near the north-east coast, where the smallest amount of rain has fallen. On this coast, extending from Berwick to North Shields, I was planting barometers at the various fishing-stations, from September 8 to September 21, during which time no rain fell, and the weather was generally fine.

NECROLOGY OF EMINENT PERSONS.

SIR WILLIAM EDWARD CROSSIE, BART.

On the 31st inst., at his residence, River Cottage, county Wicklow, Ireland, Sir William Edward Crossie, of Maryborough, Queen's county, baronet, was the only son of Edward William, fifth baronet, by Catharina Weauruna, sister to Warner William Lord Rossmore, and widow of Captain Harry Duff of Parley. Born at Wicklow, county Carlow, May 18, 1791; succeeded, on the death of his father, in 1798, at the early age of four years. Entered the army in March, 1812, and served in 23rd Royal Welsh Fusiliers till June, 1815, when he retired on half pay. Sir William married, 20th March, 1830, Dorothy Anne, daughter of John Walsh, Esq. of Dublin, by whom, we believe, he has no issue.

ADMIRAL CHARLES GORDON, C.B.

On the 31st inst., at his residence at Bath, Admiral Charles Gordon, C.B., aged 79. The deceased officer was brother to the late Admiral Henry Gordon, and to a state of the Right Hon. James Willeoughby Gordon, Bart., and entered the navy as a midshipman in June, 1796. He was three years signal officer to Admiral the Hon. William Cornwallis, in command of the Channel Fleet; was appointed to the *Levin* ship, and afterwards to the *Corvette*, 36, one of the squadron employed in the destruction of more than eighty piratical vessels in the Persian Gulf, during November, 1809, rendering the most effectual assistance to his senior officer. As commander of the *Ceylon*, of 44 guns, he sustained a most gallant night action off the Isle of France, when the French ships *Albatros*, 44, and *Fier*, 18 guns, in which he was wounded, and his ship, being completely disabled, was compelled to surrender. The *Ceylon* was, however, retaken the same day by the *Boscawen* and the *Other*, brig, and Captain Gordon and his crew honourably acquitted by a court martial of all blame. In 1840 he was made a Companion of the Bath; Rear-Admiral, 1841; Vice-Admiral, 1843; and Admiral, 20th January, 1848. He married, November 20th, 1818, Anne, eldest daughter of Andrew Thomas, eleventh Lord Blaney.

MR. ALFRED CHALON, R.A.

On the 31st inst., at his residence, "El Retiro," Campden Hill, Kensington, in the 80th year of his age, Alfred Chalton, Esq., R.A., portrait painter to Her Majesty, member of the Society of Arts of London, and honorary member of the Society of Arts at Geneva. This amiable and distinguished artist (the brother of the late Mr. John James Chalton, R.A., the landscape painter), was for many years the most popular painter of portraits in water colours of his time, and especially of those of ladies, whose painter he may be said to have been *par excellence*. Not only were his likenesses very truthful, but the details of female dress and decoration were depicted with a grace and feeling particularly felicitous, in that *je ne sais quoi* which was his favourite light. A brother artist used to designate such elegant accessories as *les chaperons*. The late Mr. Leslie, R.A., had so high an opinion of his talents, that he collected his autograph, recently published, "the first amongst painters in water colours;" and when, a few years ago, the brothers Chalton exhibited a joint collection of their art works, in the *Art Journal*, speaking of Alfred, he said, "He has produced in his day many elegant ladies, without labouring fetters,—such as the admirable portrait of Rachel in this exhibition; and these sustain his fame high amongst the best painters of the epoch." The two brothers were tenderly attached to each other, and rarely seen apart. Mr. Alfred Chalton laboured, it would appear, to the last, with the disease of the French Academy; he had no less than six pictures. He had offered to the inhabitants of Hampstead (a place he was very fond of) his fine collection of water-colour paintings, on condition of a building being provided for their reception, and a trifling salary paid to a curator; but the gift had not been accepted. As he had died intestate, all his property, including that collection, will have to be disposed of by public auction. It is stated that he did make a will before leaving town this summer, and duly signed it, but with a carelessness characteristic of the literary and artistic world, he had neglected to take the necessary precaution of having it witnessed. His only sister, as well as his brother, having died before him, Mr. Chalton has left no very near relative. It is, therefore, at present doubtful who will be entitled to administer to his estate. The family was of Swiss extraction, and its legal representative may probably be found abroad.

WILLS AND BEQUESTS.

Lady Smythe, the relict of Sir Edward Joseph Smythe, Bart., and the daughter of Sir Edward Bellier, Bart. Her ladyship died at her residence, Wootton Hall, Warwickshire, on the 17th August, aged 70; having executed her will in December last, which was proved in London on the 5th inst., by her brother Richard Montagu Smythe, Esq., M.P. for the county of Louth, one of the executors, her daughter Catherine being the other executor. To her eldest son Sir Charles Frederick Smythe, Bart., who was the heir to his father's estate, she bequeathed, as a token of affection and regard, a valuable collection of French clock, candlesticks, &c. Her property also has been bequeathed amongst her children, with the exception of a legacy to her brother Lord Bellier, a peer of Ireland, and formerly one of the Privy Council of the Parliament of that kingdom, and some bequests to her ladyship's children and legacies to her friends and dependants of her ladyship's family. Her daughter Catherine Smythe is the residuary legatee.

The Most Illustrious Donna Maria de Bettencourt Senechal, relict of the Most Illustrious Bento de Bettencourt Vasconcelos e Lemos, of Angara do Hero, in the island of Terceira, in the kingdom of Portugal. This is a will of a Portuguese noble of distinguished rank, who died at the above place; it is necessarily of a somewhat considerable length, and being composed of some property in English, it became requisite to have a translation from the Portuguese into the English language. The will is of moderate length, and the distribution of her property is confined to the various members of her family. These dispositions are in accordance with the peculiar laws and customs of the kingdom of Portugal, leaving two-thirds of her property to her surviving daughter, and the children of her two deceased daughters, as her rightful heirs, and disposing of the remainder also

he is excessively fond of music, and there is " seldom any great musical festival in London, or its suburbs, in which he is not to be seen," which, considering his clerical occupations, must keep his hands pretty full. As a preacher, his sermons are distinguished by " originality of thought and copiousness of language, studded with images lofty and poetic," and they are likewise remarkable for their power of " indoctrinating with an all-pervading religion the sentiments the transactions of every-day existence." We wonder what Mr. Bellows thinks of his kind of theology, and whether he considers it likely to be advantageous

It is hardly necessary to add, after these examples we have given, that the English of this book is rather peculiar. The words sometimes take rank as malapropisms, and the sentences are often muddled off in the middle, the last being left without a subject. The words *travelling* and *travellers* are used in a sense which I should doubt, that the late Mr. Modford is called Mr. Modified, and by a lapse of memory, that Edmund Keen is said to have sung only once on the stage. But the most curious error is that which occurs in the last chapter. Mr. Liston was "very celebrated in performing the operation" of *strabismus* (which, we presume is the operation alluded to); or that "Mr. Moseley has been distinguished by his skill in the operation of *strabismus*;" or that "though born to affluence, and unselected to fortune's orb, from the cradle to the grave, he failed the long enviable prosperity of his career to descend to the poverty, or, indeed, the large portion of the fortune, which corresponds to the contented selfishness of the peasant." It is not those on whom affluence, as a student's hand has never fallen, of adversity's sharp arrow, and bitter penalties, and cruel humiliations, &c., &c., "through nearly an entire page, without a resting point on

USEFUL ANIMAL PRODUCTS.*

FROM the title "Uses of Animals," Dr. Lankester has just published the first half of a series of twelve lectures, delivered at the South Kensington Museum, "for the purpose of explaining, to those interested in the subject, the nature and objects of those animal products which are employed in the arts and manufactures." The lecturer's lucid and judicious treatment of his subject has attracted a very large audience, and the lectures (delivered extemporaneously) are published from corrected short-hand notes, a good deal of repetition, some curiousest of expression, and many curious errors of fact and of grammar being the result. The method of treatment, that there is, in reference to each raw product, a good deal of detail of microscopic structure and physiology in reference to the parts of animals to which it belongs, together with some statistical and practical information concerning the

man-made, however, to persist against the doctrine, rather clumsily put forward in this little volume, that whatever is not actually made *as of* for the direct service of man, is wasted, the proper object of its existence not being attained. "In course of time," says the author, "we may find, if we learn to think, that the world is not made for man, but that man is made for the world. He has made, He has intended for the use and benefit of man."—p. 53. Now, it is quite certain that in the greater part of the ocean, and in almost the whole of the land situated in the torrid and frigid zones, there is everywhere abundant life, although man is either absent, or represented by tribes whose intelligence is far below that of the white races. It is equally certain that the greater part of the earth is now, and must continue to be uninhabited by intelligent and manufacturing races of human beings, while, during the whole of the earth's early history, before man was introduced, there was the same development of life, and to human intelligence whatever, it seems clear, that the world was not made for man, or else that the All-wise and All-powerful Creator was and is satisfied with a very imperfect carrying out of his intentions. It seems to us more consistent with reason and due reverence, to assume that man occupies a distinct place in creation, being able to contribute to his world, and to the world at large, in a manner proportionate to his will, and render them useful for his various needs; but that, whether he be absent or present, whether he exist in silence, or busy himself with manufactures, Nature still holds on her way evenly and perfectly balanced,—that there is no such thing as waste in her household, every thing being arranged for some useful purpose, and being available for the general economy of the world.

Quitting this subject, let us turn to the doctor's budget, and see what instances of quality it furnishes us with. Describing hair and wool, he points out that to the presence of small serrations in the latter its peculiar properties and relative value are due. The microscope reveals, that in the short wools from the neck and sides of the sheep, the serrations are 7 to 7.5 times as numerous as in common long Leicesterian fibres there are but 1.250. The value of wool seems to depend on the serration of each hair. The entangling of the hairs covered with these serrations produces what is called *felting*; and as some kinds of hair and wool felt well and completely, while others remain loose texture, we have, for example, the difference between the *carpeting* and *blanketing* wools, between carpeting, blankets, and flannel; and the latter the substance known as hemlockize, stuff, canvas, &c. This is a curious and instructive illustration, and

is well described. We are also told, that in working hair and wool there is no waste, the clippings and other parts not used otherwise being ground down to a powder, to manufacture flock paper; whilst of old woollen rags the better parts are used to re-manufacture into a cheaper kind of clothing, and the dirtiest and most rotten parts are still saleable as manure.

Leather is well known to be manufactured of skins. The outer layer, or true skin of animals, chiefly consists of the epidermis called gelatin, which is soluble in water, and is converted into tannic acid, this substance is converted into leather, which is insoluble. The tannic acid is largely derived from oak bark, of which between 200,000 and 300,000 tons are consumed in a year in England only. Numerous other vegetable substances supply this important material.

The skins of almost all animals are used in the manufacture of leather. In parts that are largely replaced the kid for gloves; and as about sixteen millions of pairs of gloves are used in England every year, it is certainly interesting to know of a natural resource which other animals become scarce. The cuttings, both of skins and leather, are important articles; and Dr. Lankester suggests rather mysteriously that minute inquiries as to the source of the beautiful gelatin largely consumed in cookery and by the poultrycock should be avoided as insignificant.

But there is another use of phosphate of lime: it is needed to supply the soil with phosphorus, which, passing into the fruits of the earth, and thus becoming

But there is another use of phosphate of lime: it is needed to supply the soil with phosphorus, which, passing into the fruits of the earth, and thus becoming

* *The Uses of Animals in Relation to the Industry of Man.* By E. Lankester, M.D., F.R.S. London: Hurdwicke, 1903.

THE LIFE OF SIR MARTIN ARCHER SHEE.*

[illegible]

Sir Martin was ever ready to listen, prompt in social correction, and eloquent on public occasions, when called upon to address an assembly. He seemed natural to his country and ancestry; for he was descended from the family of an Irish peer, though his forefathers had been driven from their native land by the English, and he himself was a native of the Emerald Isle, (ingratiating trait!) and a native of the Emerald Isle, and a native of the Emerald Isle. As a boy he was lively and precocious—learned music, and wrote a play before he was twelve years old, and, at the age of fifteen, had been led to the study of the law, and had been led to the study of the law, and had been led to the study of the law, with a profession, with so much success that he was exported to London, 1788, at the age of seventeen. He had favourable introductions, and within the month of his reception by Burre, Murray, and others, he had been introduced to the notice of the most distinguished persons of the day, and had been introduced to the notice of the most distinguished persons of the day, and had been introduced to the notice of the most distinguished persons of the day. Sir George Siles, returned from India, and paved the way to more beneficial connections.

meations. He was reintroduced to Burke, and by Burke to Reynolds, who now was interested to notice and advise him. He entered the Academy as a student, in 1780, and was elected into his class by his fellow-students, and by the vote of the president, while lodging in Craven-street; he walked daily for several months, at dinner-time, to St. Paul's, and got back in time for tea; that his hands might not suffer, he had hot his appetite for the midday meal; and he was not without his literary friends, and his friends in the House of Peers; the agent, made some amends for those abstinences; and Shove was fond of the theatre, and painted likenesses of several leading performers. His first attempts at exhibiting were in 1781, and his pictures were returned, from want of sale, in 1782, and in 1783, and in 1784, and in 1785, and in 1786, and in 1787, and in 1788, and in 1789, and in 1790, and in 1791, and in 1792, and in 1793, and in 1794, and in 1795, and in 1796, and in 1797, and in 1798, and in 1799, and in 1800, and in 1801, and in 1802, and in 1803, and in 1804, and in 1805, and in 1806, and in 1807, and in 1808, and in 1809, and in 1810, and in 1811, and in 1812, and in 1813, and in 1814, and in 1815, and in 1816, and in 1817, and in 1818, and in 1819, and in 1820, and in 1821, and in 1822, and in 1823, and in 1824, and in 1825, and in 1826, and in 1827, and in 1828, and in 1829, and in 1830, and in 1831, and in 1832, and in 1833, and in 1834, and in 1835, and in 1836, and in 1837, and in 1838, and in 1839, and in 1840, and in 1841, and in 1842, and in 1843, and in 1844, and in 1845, and in 1846, and in 1847, and in 1848, and in 1849, and in 1850, and in 1851, and in 1852, and in 1853, and in 1854, and in 1855, and in 1856, and in 1857, and in 1858, and in 1859, and in 1860, and in 1861, and in 1862, and in 1863, and in 1864, and in 1865, and in 1866, and in 1867, and in 1868, and in 1869, and in 1870, and in 1871, and in 1872, and in 1873, and in 1874, and in 1875, and in 1876, and in 1877, and in 1878, and in 1879, and in 1880, and in 1881, and in 1882, and in 1883, and in 1884, and in 1885, and in 1886, and in 1887, and in 1888, and in 1889, and in 1890, and in 1891, and in 1892, and in 1893, and in 1894, and in 1895, and in 1896, and in 1897, and in 1898, and in 1899, and in 1900, and in 1901, and in 1902, and in 1903, and in 1904, and in 1905, and in 1906, and in 1907, and in 1908, and in 1909, and in 1910, and in 1911, and in 1912, and in 1913, and in 1914, and in 1915, and in 1916, and in 1917, and in 1918, and in 1919, and in 1920, and in 1921, and in 1922, and in 1923, and in 1924, and in 1925, and in 1926, and in 1927, and in 1928, and in 1929, and in 1930, and in 1931, and in 1932, and in 1933, and in 1934, and in 1935, and in 1936, and in 1937, and in 1938, and in 1939, and in 1940, and in 1941, and in 1942, and in 1943, and in 1944, and in 1945, and in 1946, and in 1947, and in 1948, and in 1949, and in 1950, and in 1951, and in 1952, and in 1953, and in 1954, and in 1955, and in 1956, and in 1957, and in 1958, and in 1959, and in 1960, and in 1961, and in 1962, and in 1963, and in 1964, and in 1965, and in 1966, and in 1967, and in 1968, and in 1969, and in 1970, and in 1971, and in 1972, and in 1973, and in 1974, and in 1975, and in 1976, and in 1977, and in 1978, and in 1979, and in 1980, and in 1981, and in 1982, and in 1983, and in 1984, and in 1985, and in 1986, and in 1987, and in 1988, and in 1989, and in 1990, and in 1991, and in 1992, and in 1993, and in 1994, and in 1995, and in 1996, and in 1997, and in 1998, and in 1999, and in 2000, and in 2001, and in 2002, and in 2003, and in 2004, and in 2005, and in 2006, and in 2007, and in 2008, and in 2009, and in 2010, and in 2011, and in 2012, and in 2013, and in 2014, and in 2015, and in 2016, and in 2017, and in 2018, and in 2019, and in 2020, and in 2021, and in 2022, and in 2023, and in 2024, and in 2025, and in 2026, and in 2027, and in 2028, and in 2029, and in 2030, and in 2031, and in 2032, and in 2033, and in 2034, and in 2035, and in 2036, and in 2037, and in 2038, and in 2039, and in 2040, and in 2041, and in 2042, and in 2043, and in 2044, and in 2045, and in 2046, and in 2047, and in 2048, and in 2049, and in 2050, and in 2051, and in 2052, and in 2053, and in 2054, and in 2055, and in 2056, and in 2057, and in 2058, and in 2059, and in 2060, and in 2061, and in 2062, and in 2063, and in 2064, and in 2065, and in 2066, and in 2067, and in 2068, and in 2069, and in 2070, and in 2071, and in 2072, and in 2073, and in 2074, and in 2075, and in 2076, and in 2077, and in 2078, and in 2079, and in 2080, and in 2081, and in 2082, and in 2083, and in 2084, and in 2085, and in 2086, and in 2087, and in 2088, and in 2089, and in 2090, and in 2091, and in 2092, and in 2093, and in 2094, and in 2095, and in 2096, and in 2097, and in 2098, and in 2099, and in 2100, and in 2101, and in 2102, and in 2103, and in 2104, and in 2105, and in 2106, and in 2107, and in 2108, and in 2109, and in 2110, and in 2111, and in 2112, and in 2113, and in 2114, and in 2115, and in 2116, and in 2117, and in 2118, and in 2119, and in 2120, and in 2121, and in 2122, and in 2123, and in 2124, and in 2125, and in 2126, and in 2127, and in 2128, and in 2129, and in 2130, and in 2131, and in 2132, and in 2133, and in 2134, and in 2135, and in 2136, and in 2137, and in 2138, and in 2139, and in 2140, and in 2141, and in 2142, and in 2143, and in 2144, and in 2145, and in 2146, and in 2147, and in 2148, and in 2149, and in 2150, and in 2151, and in 2152, and in 2153, and in 2154, and in 2155, and in 2156, and in 2157, So fitted, on the death of Laurence, in 1830, he worthily succeeded to his chair, his only rival in the estimation of the electors being David Wilkie, who,

part of the food of animals, enables their bones to acquire due hardness. Some of the mineral matters of highest importance contain phosphorus in a soluble form, which is readily supplied from bones. Phosphorus of lime also exists as a natural mineral, but except in some of the accumulations of remains of animals, recent or fossil, it is rare. Dr. Lankester, indeed, speaks of a supply in Spain, where exist thousands and tens of thousands, probably millions, of tons, and which is "of more value than all the gold Spain obtained from the New World." We regret to be unable to throw doubt on this statement; but if we are to believe Dr. Daubney and Capt. Widdington, who visited the site of this mineral several years ago, there is neither any assurance of large quantity, nor any probability of the smallest money value, in these reefs of the Spanish gold mines of America.

Ivory is a peculiar combination of bone, and tables of ivory, for the artist, are now obtained of large size, by slicing a tusk like a cucumber, and afterwards softening the ivory by exposure to phosphoric acid, by which it is rendered almost plastic. When washed with the strong alkali it is found to consist of a mass of plates 30 inches square have been obtained at a small cost. Ivory has many other uses, and some 35,000 male elephants must be killed annually to supply the English market alone.

We pass over the lecture on soap, to say a few words, in conclusion, on Dr. Lankester's views of scientific education. We cannot agree that a mere cramming with facts, however important, deserves the name of education. We hold that Education and Information are things altogether distinct, and we believe that, for the latter to bear fruit, the former must have preceded it. Education is such a preparation of the intellect as shall enable its possessor to understand and reason correctly on the facts and information afterwards learnt or acquired by experience; and thus language and mathematics, in themselves abstract studies, are much more useful to the unimpaired and undeveloped intellect than a mere exercising of the memory in the recollection of a vocabulary of words. We hope the result of the North Kensington Museum and its teaching will never interfere with the good old system of instruction under which our eminently practical national character has been developed.

AGNES ARNOLD.

THE author of a political discussion, or a solemn historical narrative, in general draws his information, when applicable to recent times, from materials collected by journalists and biographers. His *domestic personæ* are prominent statesmen and soldiers, on whom public opinion has already passed its verdict; his incidents are great events, the nature and scope of which has been already commented upon, while his facts, his reflections, and his very language, are drawn from documents which have been previously prepared. A much more difficult task lies before the novelist. If he aspires to enter the field opened by the great masters in this department of literature, he must not only invent his chief incidents, but he must create his characters, and represent them with such skill and truthfulness that they may serve as types of great classes in society, and illustrate by their actions and feelings the world in which he moves. He who has had in modifying the habits and feelings of those who have necessarily remained within the sphere of private life. The historian, in short, describes the storm at the point where it bursts forth, and where its phenomena strike every beholder; while the novelist, on the contrary, follows the storm as it moves, follows the course through eddies and shoals, and exhibits the less marked but more permanent influence which their reflected and crossing ripples produce upon the shore. The writer of fiction can seldom glean his information from books. He traces, in tracing examples of the events which he wishes to represent, not intellect, but chiefly to a careful observation and study of the times in which his scene is laid. For evident reasons, a novel can be best written in the generation succeeding that in which the events it records are supposed to have happened. It was sixty years after the last Scotch rebellion when Sir Walter Scott wrote "Waverley," the most perfect of his works, and the very archetype of historical romance. It is now sixty-two years since the events before which are elucidated by Mr. MacCabe. He takes up his theme after the proper lapse of time, when a few old men still survive who bear a part in the events he describes, and when the events are all but forgotten by the rising generation. Just as Sir Walter Scott drew his information from the lips of Highland chiefs and Jacobite lords who had been "out in the forty-five," the author of "Agnes Arnold" has derived his knowledge of the heroine's career of 1798 from distinguished Irishmen who took part in the rebellion of that year. He has thus had the best means of obtaining a kind of information not to be got from books, but indispensable to the novelist, and of learning from reliable sources what was the influence of the ferocious struggle between Protestant and Catholic which then distracted Ireland. Thanks to information so obtained, he has succeeded in producing a work abounding in incident and character, which shows a ripe acquaintance with Irish life in all its ordinary phases, and a ripe acquaintance still with the historical events by which the habits and feelings of the present generation have been shaped. The close of the last century. The plot is no compact and replete with incident that it would not be possible to give a summary of it.

The most carefully drawn of his characters is Holly the Spy, a tooth-browed ruffian, not altogether devoid of some sympathy, who, in the execution of his duty, has escaped the gallows, although prone to crime, but who, in the Ireland of 1798, found fitting employment as a government spy and informer, and in this way acquired the power of doing infinite mischief. The brutality and selfishness of this personage are brought out striking contrast with the broad qualities of the noble, single-hearted, and high-spirited Irish squire, John Kirwan, who, in an attempt to stand aloof from the violence alone of the Protestant and Catholic factions, is suspected and persecuted by both, without having it in his power to appeal to a Government which is too much following an independent and successful course. His grief, when he discovers the treachery of one belonging to his own household—when he finds that he had provoked the bitter enmity of persons against whom he had never cherished an unkind thought—and when he betakes himself for consolation to a friend, a Kilmoyne, is very touching and true to nature. The part played by outlandish personages is very judiciously treated, by good faith in survey tales, by the *grand monarque* in old French plays, and by the home-bred, but suspicious, upright, and faithful Scotch agent in Miss Edgeworth's tales, is performed in this novel by a Scotch soldier, Captain Abercrombie, whose character—less infinitely honorable to his country—is treated with great delicacy and discrimination. Miss Agnes Arnold, the heroine, is a very fascinating young Irishwoman, and perhaps all the more fascinating that she is gifted with intelligence beyond her years. But, upon the whole, we prefer the English maid, Lucy Walcott, who, in the novel, is a more attractive and sensible girl, guilty of just enough bad grammar and ignorance of book-learning to remind us that she does not belong to "the upper ten thousand."

Her admirer, Pat Kinchela, is one of the author's happiest conceptions; and, indeed, as good a representation of a red-blooded, witty, and kind-hearted young Irishman as any we recollect within the whole range of recent fiction. His love of his country, while she sits on the purple heath of his own, holding him tight round the waist, is extremely well imagined, and is worked out with great spirit and vivacity. It was, we think, one of Moore's medical men in love, who arrived, after a process of ingenious thought, at the conclusion that he would best employ his military and imperialist "services" in the service of his country, and importance by conducting her to a dissection. Pat Kinchela shows a deeper insight into the female heart when he, like a true Irishman, resolves to advance his suit by dancing the "pottering jig" at a village ball with a crowd, and his love's doubts, and his misanthropic and his "sorrow" are all very well and hollow in the door, to the music of a supple-jointed fiddler, half drunk, playing up to him with proper spirit, and inspiring him with fun, frolic, and joy, till he could kick up a clatter like twenty "drag-boats," and knock the panels, bolts, and hinges of a thousand solidly built "sparables." The greatest pleasure of the piece would have been in a less uproarious, but in a more serious and entertaining fashion; and, indeed, we commend the scene where Mr. John Kirwan pays his addresses to Miss Arnold to those who contemplate matrimony, as supplying hints not to be met with in the most "complete" story-writer, or in any repository of a kindred character. In our respect, Mr. MacCabe has been pre-eminently successful. From the beginning to the end of his novel he stimulates curiosity, and keeps alive the interest of the reader by a series of incidents which are never intercalated, and never interrupted by episodic, irrelevant description, or tiresome reflection, but which all converge to the *dénouement*. To conclude, he leaves on the reader's mind a faithful and animated picture of an episode in Irish history which has a most important bearing on the politics of our own time, but which, nevertheless, has compelled the careful study of those most interested in its issues.

VERSE—AND WORSE.*

POETRY! everybody went to the East for marvels. Quacks, quack, or said they, did their pills from the Orient; astrologers sent to Egypt for stuffed crocodiles, and readers of romance pronounced the "Arabian Nights" the most wonderful of books. Things have altered. The arrival of an East-Indiaman is no longer regarded as an event, and, acting in obedience to the motto of Bishop Berkeley—

"Weasted the course of empire takes its way,"

people now look across the Atlantic for the wonderful and strange. Every steamer from America bears a marvel of some sort or another. The old woman's tale of there being but eight wonders in the world has long been an idle story; a book without the least straw of truth, which fell from the mouth of the first pedlar from Connecticut landed in Liverpool with a pine cask of home manufacture; the arrival, one after the other, of wooden inventions, scrubbing-machines, machines for doing all the washing, washing, pill-making, salt-swinging, and bag-making, only prove the lateness of the late-upon East and the productivity of the West,—or the Great West, as the playful Yankee prefers, tearing his native soil. There is one commodity, however, associated with the dusky East, which foolish people believe yet to come over in packages of tea and china, and which, alas! is unimpeachable poetry, the only compound which may be observed on the shelves of tea-chests, and dancing over Indian porcelain. Ah, well! America now supplies that too, and the East is cheated out of a staple commodity.

At the present moment certain imaginative persons in the United States are engaged in crowning with laurel a new poet. Flaxen-haired Byronic youths have laid their day, and now the path is cleared for the thick-necked "swart" school. We learn that in certain quarters the muscular poet is popular, and whilst all the young ladies here are dotted up and down with the names of Byron, Keats, and Keats, trusting their imaginations to the bewitching "Idylls" of Tennyson, their sisters across the water, at Saratoga, or the Falls, are in love with Walt Whitman.

It seems ridiculous, but still we are assured of the fact, that by many persons in the United States, the name of Whitman is regarded as the most potent in powers of inspiration to our Saviour. The parallel is ingenious and disgusting, and but for our knowledge that there are such people as the Murnous, and such institutions as the Aspernere, we should be very loth to believe that it was ever instituted amongst even the weak intellects of the sister country.

From the circumstance, however, we may learn a lesson. Civilization kept at a very high point of pressure, the economy of life too refined, nature put back into the stable too far, produce strange fancies and fancies that are unknown to health. There is a certain stage in disease, the doctor tells us, when the patient has a keen appetite after all sorts of odd things—slate pencils, corals, or leather. So with the literature of a crowded and anxious people, it occasionally exceeds its proper bounds, suffers pethora, and puts forth pithless things which dissonate minds suitable for true health. Each individual exorcises on the "Leaves of Grass."

It appears that in New York, some years ago, a rough fellow was employed in a printing office. Nature had given him a strong constitution, and his features were of a good mould. Not a word of his name, but he was a good fellow, and the United States stands still—a servant today, master to-morrow; now teaching a school in the backwoods, now the head of a bureau at Washington; therefore there is nothing wonderful in the fact that Whitman was soon holding the pen of a journalist, and writing for a democratic paper. After trying various schemes for the exercise of his muscular pen, he hit upon what he conceived to be a new vein of poetry. The "poetry" is not poetry, but "verse"—and verse, and the "verse" is of a kind that we are thankful is seldom opened. The metre of Longfellow's "Hiawatha," it will be remembered, was pointed as not for first acquaintance, not remarkably pleasant, but it is music compared with Whitman's lines. Here are a few selected at random. They remind one of so many negro songs:—

"America! America!
Mother-humans! Foremost!
Crests human! Crests human!
For just a programme of death."

Other paragraphs—or, as you will, verses, we suppose the poet would term them—read like entries from a bookworm's newspaper, or notes from a stump-orator's speech. At page 119 we have—

"What does it mean to me? To America's person, progress, class?—
America! the glory, Yankee, soldier, immigrant, sailor, squatter, and statesman, statesman!"

We believe it is the author's lament that he is the sole discoverer of the metre in which he indulges, and that its originality is the delight of his poetic admirers. But the leading principle of the book, where the sense is intelligible, appears to be—

"LEaves of Grass: Poems by Walt Whitman. Boston: Thayer & Eldridge. Year 85 of the Master (1860-61)."

* Agnes Arnold. A Novel. By William Bernard MacCabe. London: T. C. Nisbet, 1860.

holding this position; and in the present manner the information afforded as to the names of officers and non-commissioned officers in the Artillery Corps, in the Volunteer Rifle Corps, the statements respecting the Mounted Rifles, Colonial Rifles, list of anniversaries, &c., prove that all the necessary duties required from such an organ can be adequately and satisfactorily discharged.

The October number of *Bentley's Miscellany* is light and lively. It commences with pleasant news for its readers—the promise of a new tale by Mr. Ainsworth. A simple incident is turned into a romance by Dudley Cretschin's manner of telling it. If his "Bel and the Dragon" had been published in June or July, instead of October, we have little doubt but the reading of his descriptions of Tappin and Cookham would have induced thousands of visitors to examine that portion of river Thames scenery which is so well described by him. "A Coquette's Campaign," by Onida, is a rollicking story, thrown off in a hand-gallop style. "The Recollections of an Old Salt" is a judicious analysis of Admiral de Gravelle's sovereignty; and in "The Story of Francesco Novello da Carrara," and "Voltaire at Ferney," the reader is supplied with two attractive morsels of interesting biography. The great charm, however, of the entire number, is the tale entitled "The House Blackwink—Part the First,"—the renouncement of a little novel, so well that it is sure, so long as it is continued, to be the first looked at in all future numbers. One fault is to be found with it that can be easily avoided—the introduction of a most disagreeable provincial dialect. We hope there may be no more specimens given of it; for what is already printed is absolutely unintelligible.

The *Forerunner's Review* has not the slightest connection with the chase, or archery, or sporting of any kind. It is a publication devoting itself to the interests of the working-classes—an organ and record of Saving and Benefit Societies throughout England. The great merit of the *Forerunner* is evidenced by poetry and essays; but the better portion includes facts and articles, such as are to be found in the present number, on "Provident Institutions," "Vital Statistics," and "Emigration."

MUSICAL PUBLICATIONS.

The Singer's Library of Concerted Music. Edited by JOHN HULLAH. Published by Addison & Co.

THIS new serial is one of the most interesting publications now issuing from the musical press. It is in two separate series, the one consisting of sacred, the other of secular music. Each series includes pieces forming integral parts of great works, or listens drawn up in rare and expensive collections; compositions of foreign masters now adapted for the first time to English words; music originally requiring combinations of voices rarely practicable, now re-arranged in a manner calculated for ordinary use; and pieces composed by eminent living musicians, many of them expressly for this work. The sacred pieces are anthems, hymns, choruses, psalms, &c., adapted to use either in places of worship or in private families. The secular series consists of madrigals, glee, and part-songs, chiefly, but not exclusively, by the greatest English masters, and all of them translated in English poetry. The work is issued in weekly numbers, a number of each series being published simultaneously; and also in parts, each part consisting of four or more numbers, according to the length of the pieces. We have now before us twenty-eight numbers of each series, done up into six parts, and the parts again form a volume, so that the first volume of each series is completed. The price of each of these volumes is 7s., which, considering the quantity, variety, and excellence of their contents, and the elegance of their form, is a marvel of cheapness.

We have examined this work with great attention, and no less pleasure. It may well be called a library, and promises to be a rich treasure to the lovers of vocal harmony—a species of music for which England has for centuries been pre-eminent, and in which the people of this country, from the days of "good Queen Bess" to the present time, have always taken delight. The Italians excel us in the smooth and voluptuous strains of the opera, and the Germans in the gigantic combinations of the instrumental orchestra; but in the harmony of the human voice, whether employed in the grand services of our Church, or in the lighter music which forms the enjoyment of society, we can assert our superiority over every other country in the world. No one is better qualified than Mr. Hullah, by knowledge, judgment, and taste, to call the richest and rarest flowers of vocal harmony; and accordingly, in the pages before us, we find many of the greatest works of our great ecclesiastical masters, and the most charming specimens of the madrigal, glee, and part-song, from the sixteenth century to the present time—from old Byrd, Willbye, and Parrell, to our contemporaries, Macfarren, Smart, and Hullah. We cannot specially notice particular pieces of this already large collection; but we must point out one thing of much importance. Many of the finest glees of the older composers are entirely for men's voices, the highest part being given to the male counter-tenor. Mr. Hullah has re-arranged these in such a manner that the highest part may be sung by the female soprano or contralto—a liberty with the text to which some rigid purists may object; but we feel it to be a great improvement, as it is agreeable to modern taste, and what the composers themselves would have done had they written at the present time.

Lady Clara Vere de Vere. Song, written by ALFRED TENNYSON, composed by Mrs. Worthington Bliss.

Marguerite. Song, written and composed by ANNE FRICKER.

The Mother's Dream. Ballad, composed by G. A. MACFARREN.

Published by Cooke & Co.

What is Life? A Revere; the poetry by Mrs. A. M. MYSTERY, set to music by JOHN L. HATTON. Published by Addison and Co.

We have selected for notice the above vocal pieces, in the first place because they are of no ordinary beauty, and likewise because they furnish exceptions to the remark, too generally well-founded, that our composers are either careless of, or unable to appreciate the quality of the verses they set to music, and are quite ready "to waste their sweetest notes on any sort of marvellous man's poetry rhymes that may happen to come in their way. Did we desire to illustrate this remark, we might cite nineteen in twenty of the new songs which issue in such abundance from the musical press. But it is more worth while to show, by a few instances, that we have popular musicians, possessed of judgment and taste, whose genius is inspired by true poetry.

One of these is Mrs. Worthington Bliss (formerly Miss Lindsay), already known as the author of various graceful compositions. Tennyson's song, which she has now set to music, is not new to the public, but the fair composer has given it

a new charm by the simple and speaking melody which she has joined to the verse.

The fair author of "Marguerite" is a poet as well as a musician; and in this song the sound is truly an echo to the sense. The verses consist of a lover's playful and tender allusions to his mistress's name and its pretty meanings—a daisy, and a pearl. The simple natural melody, with its graceful accompaniment, might have flowed from the pen of Mendelssohn.

Mr. Macfarren, as everybody knows, stands in the first rank among our English musicians, and is, moreover, a man of literary attainments. The poetry of "The Mother's Dream" is impressive, and the music is in a congenial spirit; but the effect is injured by faults of accent and prosody, which are so glaring that it is sometimes impossible to speak the words along with the music. Such negligence we could scarcely have expected from a composer of Mr. Macfarren's reputation, and a Professor, to boot, in the Royal Academy of Music. They are not only bad in themselves, but are positively enough to students of the art.

Mr. Hatton's "What is Life?" is a composition of a high order, inspired by a poem of much beauty. It has not, we believe, been published before, and is as follows:—

"What is Life?"—Fond youth replied,

"To a grave where once with a burning glow,
Where the waves are bright as the skies above,
And the bark is guided by Hope and Love,
While the sun of hope, and the breath of flowers,
Make glad the sight of the golden hours."

"What is Life?"—Stern manhood said,

"To a grave where once heeps to dust,
A tomb with faded garlands deck'd,
A low-shed where the heart is laid;
While the sun and day, kind of bright time
Pulse on the soul like a fun'ral chime."

"What is Life?"—Old age drew near,

"With tottering limbs, and now-white hair,
And said, "The journey drear and cold,
Where death full oft doth tread,
To wander alone from day to day,
Where all they loved have passed away."

"What is Life?"—A small soft voice,

"Rejoice, made my heart rejoice;
"Tis in the night before that glorious day,
When death, and fear shall pass away,
And the tears of the mourner shall fall no more,
In the safe repose of the heavenly shore."

Mr. Hatton's music to this poem is a combination of grandeur and beauty, to which it is impossible to listen unmoved. In its masterly construction, broadness and simplicity of style, beauty of melody, and depth of feeling, it is akin to the exquisite cantatas of Haydn.

OUR SOCIAL REPUBLIC.

In this Republic where we sit,

Each man his glass in hand,

Free as the birds that chant in upper air,

Be this the Charter of our wit,

That all may understand,

And those the taxes every one must bear.

Lightly, brightly

Let the wit abound;

And temperance pass

In every glass,

That sparkles in our round;

And he who jears at Woman's Truth,

Or tips his jest with gall,

Or scorns the man that nobly dares be poor,—

What'er his age, what'er his youth,

A traitor to us all,

He shall be banished! banished evermore!

But he, the generous citizen,

Whose jests are pure, though keen,—

Who laughs his laugh, and sings his song,—

Who aids the cause of honest men,

His country and his queen,

And bows no knee, except the hate of wrong;

Only, truly,

One of us he is;

To all our rights,

Through joyful nights,

We give him welcome here.

To this Republic where we sit,

Each man the other's friend,

And both all knaves and scoundrels from our door,

To feast where wisdom, mirth, and wit,

With social pleasures blend,

We make him welcome, welcome evermore!

LIBERTY OF OPINION: MARSH'S COMPLAINT.—At the sitting of the National Convention, on 21st October, 1792, Marsh was charged with inciting a battalion of the March-soldiers to massacre a regiment of dragoons, and also of inciting in his journal soldiers to assassinate their officers. The Assembly was greatly moved by these statements; and some of the representatives mentioned that they had recently heard Marsh demand 170,000 *livres* to be kept off by the guillotine. "Well! well! what of that?" replied Marsh to his accusers; "yes, it is true I said so: that is my solemn and deliberate opinion, and I repeat it." The orator was interrupted in his speech by cries of indignation. "This is atrocious treatment," exclaimed the assembly orator; "have any fellows who talk of liberty!—of the liberty of opinion, too! and yet they want to deprive me of the liberty of having my own opinion. What abominable tyrants! They talk, too, of three being factions in the country. Why there is but one,—and that is composed of all who are inimical to myself—to me—Marsh—the friend of the people!"

THE LONDON REVIEW

AND WEEKLY JOURNAL OF POLITICS, LITERATURE, ART, AND SOCIETY.

CONDUCTED BY CHARLES MACKAY.

Contents of No. 1, July 7th.

Our Principles and Politics.
 Italian Unity and Italian Craft.
 Austria—Political and Commercial.
 France—Present and Future.

CONDUCTED BY CHARLES MACKAY.

No. 16.]

SATURDAY, OCTOBER 20, 1860.

[Price 3d.]

TWO MEN OF "IDEAS."

WHEN the people of France, alarmed for the safety of their shops and their lives, rushed into the arms of a military despotism, to escape from socialism, red republicanism, and anarchy, they listened with complacent credulity to the boasts of their new Emperor that "he had closed the era of revolutions," and that his "Empire was peace." Seldom, however, have boasts been more completely falsified. To King Canute, sitting upon the sea-shore with his courtiers around him, it was about as easy to close the era of tides, as it is to Napoleon III. to stay the waves of revolution. The great popular tide which ebbed after 1830, began to flow again in 1848. It is flowing still, and there is not a despot in Europe who can drive it back.

Napoleon III. is a man of an "idea," and looks upon himself as the child of destiny. His idea was to restore the dynasty of Bonaparte to the throne of France, and to make France as mighty in Europe as she was ere Fortune first played false to his great predecessor, within the walls of Moscow, and in the icy stream of the Berezina. He has realized the idea, in both of its developments, because he had France to work with him, by him, and for him, and because he had strong faith, invincible determination, and the stern tenacity of a fatalist, to hold to his purpose through good and evil. In his other idea, that his "Empire was peace," he has not been so fortunate. It was a mere political expression, unless he could govern all Europe as well as France, and close the era of revolutions in Italy, Hungary, Germany, and every part of the continent where the people desired liberty and a voice in the management of their own affairs. All powerful at home to repress the revolutionary sentiment, he is utterly powerless abroad to prevent its growth and outbreak. He does not himself seem to know that he acts in a double capacity. Success and the possession of a throne have made him a conservative, but Nature made him a revolutionist. In the days of Louis Philippe he was a conspirator and a fomentor of revolution—*against* France. In the present day, fate, fortune, circumstance, even his name combine to make him, *against* Europe, the same conspirator that he was against the house of Orleans. It cannot be otherwise. His example is greater than himself. It is because he has realized his idea that other men are incited to realize theirs. It is because France overthrew an odious government, and a family for whom it had no love, that other nations, more unhappy than France has ever been, even in the very thickest turmoil of her revolutions, have determined to do likewise, and that they will never rest until the desire be accomplished, whatever French or any other despotism may say or do to prevent them.

But, great as Napoleon III. is when looked upon as the man of an idea, King Victor Emmanuel is even greater than he. A purer purpose than the Third Napoleon inherited from the First was inherited by Victor Emmanuel from his father, Charles Albert. The great idea of the unity, the freedom, and the independence of Italy, was not annihilated on the fatal field of Novara, when Austria seemed, for the moment, to have crushed the last hopes of Italian patriotism, and Charles Albert abdicated his throne to die broken-hearted and alone in a wayside inn, afar from the beloved country for which he had done and suffered so greatly.

In his proclamation to the people of Southern Italy, King Victor Emmanuel—at this moment the foremost man of Europe—recalls

those facts to mind. He shows that it was this great idea which led him to build up the fabric of Piedmontese liberty, that all Italians might see and love it; it was that and this idea which led him, though only the sovereign of a third-rate state, to claim partnership with Great Britain and France in the war undertaken to preserve the Turkish empire from the spoliation of Russia; and to incur liabilities and make sacrifices which his country could but ill afford. It was this idea, also, which led him to make Piedmont, in all times and places, "the standard-bearer and arm of Italy," and which led him to court the aid of the French Emperor in 1859 to strike a blow at Austrian rule in Lombardy and Venetia, which might make atonement for the reverse of Novara. It was this great idea which led him to accept the proffered allegiance of Tuscany, Modena, and Parma, and to annex them, by the will of the people, to his own dominions, though by so doing he offended his powerful friend. It was this, also, which led him to sacrifice Savoy that he might gain Italy, and to brave the fulminations of the Pope—the hatred of Austria—the coolness of France—that he might annex, in spite of all these embarrassing influences, but supported by the will of the people, the Romagna, Umbria, and the Marches. Last of all, it is this idea which leads him to Naples, to receive from the hands of the illustrious Garibaldi possession of the Two Sicilies, and to become, *de facto*, the King of Italy.

Gaeta, Capua, the province of Venetia, and the city of Rome with its environs and adjuncts, are now the only portions of the Italian soil, that do not yield allegiance to the constitutional king. Italy is no longer a geographical expression, but a political and national fact. Gaeta and Capua will speedily slip from the grasp of the ex-King of Naples; and the great idea of Italian unity will then have reached such a development, that neither Pope, Emperor, nor Kaiser, will be able to overthrow it, without letting loose the passions of Europe, and exciting such a general war as would shake many other thrones besides the throne of Italy. Will the sovereigns of Europe run the risk? We hope, and we believe, they dare not.

It is idle, under the circumstances, for the continental powers to prate of the illegality of the invasion of Naples. It was illegal, unjust, and in every way abominable, when Russia, Prussia, and Austria, partitioned the kingdom of Poland; but the fact had to be recognized and submitted to, because it was too mighty to be resisted. It may be illegal and contrary to all the dictates of Vattel, Grotius, and Puffendorf, that Victor Emmanuel should invade Naples; but the thing had to be done, and is well done, not only in the interest of the Neapolitan and other Italian peoples who approve of it, but in the interest also of the peace of Europe, if the great despot could but see an inch or two before them. It is fitting that Victor Emmanuel should act as he has acted, and that he should take the lead in a revolution that was to be guided, but could not be prevented; and which, without guidance, would have let loose all the malignant passions of the continent in a tornado, compared to which that of the first French revolution would have been but a summer tempest. It is possible that a great European convulsion may yet arise out of this complication; but if it do, let Austria, Russia, and France beware of the consequences!

To throw Italy back into the degraded position in which she lay six months before the battles of Magenta and Solferino, though such a consummation might please Austria, would settle nothing. Instead of a calm, constitutional, and well-regulated

monarchy in Italy, a dozen blood-red Republics would struggle for existence, and send a propaganda of mischief into Germany, Hungary, Bohemia, Poland, and France. Victor Emmanuel, revolutionist though he may appear in one sense, is, like the Emperor Napoleon, a true conservative in another. If the Pope will follow good advice, and if Austria, instead of fighting for Venice, and enslaving her dangerous friends to help her to retain the costly and ungrateful burden, will but sell it at a valuation, the peace of Europe will stand upon a better foundation than it has rested upon since February 1815. If the Emperor Napoleon means his empire to be placed, now is his time. He is known to court the good opinion of the English nation, and both the French and the English desire that the Italians should be free. Let him take his side with Victor Emmanuel now, as he did in June last year; and he will not only gratify the enlightened public sentiment and interests of England, France, and Italy, but he will cement the Anglo-French alliance, and preserve the peace of the world. He will not "close the era of revolutions," because such a feat is purely impossible; but he will procure for Austria and the other Powers the splendid opportunity to prevent violent revolutions by granting the powerful reforms which their subjects demand, in their own interest and in that of civilization.

SERBIAN POLITICS AND THE LATE PRINCE MILOSC.

THE death of Prince Miloš of Serbia is an event for which we have been prepared for some months past, but which cannot fall sooner or later, to produce its influence upon the Eastern question. The politics of Serbia are so complex; the questions they indirectly embrace so important and so little understood, that even the best informed can scarcely venture to do more than speculate vaguely upon their probable solution. Looking back for a century past upon the history of Serbia, and taking into consideration the present state of parties in that country, the most timid prophet might safely hazard the prediction that a revolution is inevitable. What the circumstances may be which will give rise to it,—what party will head the movement,—or how soon it will take place,—are, however, matters which time alone can develop. Meantime, the deceased prince has just closed a career singularly eventful in its character, and which has been protracted over a period little short of a century. Originally a common swineherd, Miloš had already acquired, in the early part of this century, a considerable prominence as a political agitator. He combined with great powers of combination inexhaustible energy, an indomitable will, and a thorough knowledge of his countrymen. Unable to write his own name, or to speak any language but Serbian, he nevertheless gained an ascendancy over his brutish and unintelligent compatriots which rendered him a formidable enemy to the power of the Sultan, and a dangerous foe to his celebrated rival Kara Georgevitch. In 1815 Miloš ventured to place himself at the head of the popular party in Serbia, and organized a revolution against the Turks. For some time the country was a prey to anarchy and civil war, and the contending factions of Miloš and Kara George, when the former ultimately gained the day by a judicious alliance with his Musulman enemies, succeeded not merely in turning the tables upon Kara George, but wisely determined to secure his success by decapitating him. It is scarcely possible to follow, at this distance of time, the intrigues by which this new combination was brought about, which resulted in the most celebrated of the Serbian rulers being thus summarily disposed of. Kara George, though justly the most notorious character in Serbian history, and a man of remarkable courage and ability, was not to be regretted, in a domestic point of view; and, perhaps, on the whole, Serbia benefited by his removal from the scene. He was a true type of the race to which he belonged—those Christian subjects of the Porte for whom the sympathies of the British public are at the present moment so warmly enlisted. A man who could stab his father with his own hand, and kill his mother by putting her head in a bee-hive, was evidently possessed of a character calculated to inspire his subjects with respect, and to render the task of a less scrupulous ruler somewhat difficult. Fortunately for Serbia, in Prince Miloš she found a worthy successor. We are not aware that he ill-treated his parents, though he endeavoured upon one occasion to compass the destruction of his son; and by the assassination of obstructive or dangerous ministers and rivals, secured the position of prince, with which he was invested by the Porte in return for his successful triumph over her old enemy, Kara George. While, by the wholesale confiscation and sequestration of the property of those of his subjects who had either by fraud or legitimate commerce acquired it, he laid by for himself a sufficient store of wealth to render his circumstances comfortable in the event of his being ejected from the somewhat perilous position of Prince of Serbia.

The result proved that the pretension was not a vain one, for the arbitrary rule of Miloš soon became intolerable. He carried murder, robberies, and excessive exaction to such a pitch that a revolution, headed by Vutsitch and Petronitch, and encouraged by both Russia and the Porte, who had at this time a common interest in favouring the national party, proved successful, and

resulted in the banishment of Miloš, and the accession of his son Milan, in accordance with a *hatti* sheriff of the Porte, by which the succession to the throne of Serbia was named hereditary, but which has since been abrogated. This fact is one of considerable significance at the present crisis, as the new prince ignores the refusal of the Porte to revert to the *hatti* sheriff of 1830, and appeals to it in his recent proclamation of the 27th September, as his claim to the hereditary succession. Milan, however, was in such ill health, that he scarcely had time to understand the nature of the new dignity with which he had been invested when he died of consumption, and was succeeded by Prince Michael the second son of Miloš. This prince, who has now again been called to the supreme power, by the death of his father, did not upon this occasion show that tact and discrimination which could alone have retained him on the throne. Manifesting a determined opposition to the national party under Vutsitch, and the Turkish authority by which it was backed, he succumbed before a bloodless revolution, after a reign of a few months, and retired to lead his father company in exile. Vutsitch, now become all-powerful, nominated, with the consent of the Porte, Alexander, son of Kara George, as Michael's successor, and, for a time, the phase of anarchy and civil war through which Serbia had passed seemed at an end. The substitution of Alexander Kara George for the Obozovitch family was a distinct intimation on the part of the Porte that the hereditary claims of that family to the throne of Serbia were at an end. Meantime Miloš commenced a series of intrigues with the Russian Government, which had, during the reign of Alexander Kara George, found itself deprived of that influence which it aspired to exercise in the councils of the Serbian Government. Her agents, acting under Miloš's advice, agitated Serbia, and found a favourable moment in 1858 for bringing their schemes to a head. Accordingly a revolution once more broke out, which ended in the expulsion of Kara George in the latter part of that year, and the recognition of Miloš as Prince of Serbia by the Porte,—scarcely against its will, however, and under the pressure of the Russian Government.

For the last two years Miloš has governed under Russian inspiration. His senate has been composed of men in the pay of that Government, and devoted to its interests, and he himself supported in his antagonism to the Porte. By the treaties of Ackerman, Bucharest, and Adrianople, Russia has, at various times and in various ways, asserted her right of interference in the affairs of Serbia. Her former exclusive protectorate of the Christians, upon the plea of their being co-religionists, gave her a constant excuse for meddling in its internal administration, and complaining of persecutions which have never been exercised, and of grievances which do not exist. This right, though she no longer possesses it, she still seeks to exercise.

The most glaring instance of her policy in this respect has just occurred. It is now well known that a conspiracy existed in Serbia to make a rising simultaneously with that originated by the Maronites in Lebanon, and which terminated so disastrously for themselves. The Porte, however, having received timely information of the projected movement, despatched large bodies of troops to the Slavonic portion of her empire. Some of these were necessarily drawn from Syria, leaving that portion of the Sultan's dominions where no movement on the part of the Christians was suspected comparatively undefended. The concentration of these troops in the neighbourhood of the districts, at that time exposed to Russian agitation rendered a successful outbreak impossible. Foiled in his projects of revolution, Prince Gortschakoff made a complaint against the administration of the Turkish Government in her Slavonic provinces, and called for a European commission. This, however, was not agreed to, and the Grand Vizier was sent by the Sultan upon a tour of inspection through the provinces in question. The result of this investigation on the part of this official is now public. He courted no secrecy; the agents of any European government, or the traveller in quest of information, were alike admitted to the tribunals which he held throughout the country for the examination of complaints and the redressing of grievances; and it is a remarkable fact that not one solitary case was brought forward on the part of any Christian of persecution on religious grounds. That the Turkish administration is faulty in many respects; that its officials are frequently corrupt; that tax-gatherers are oppressive and dishonest; and that there is abundant room for reform, must be admitted by every one familiar with the country; but these grievances press equally on Turks and Christians, and the few points in which a distinction is made in the law between their position and that of the Turks are by no means of an oppressive character, and are being rapidly removed. The utter failure of the Russian Government to substantiate the charges preferred by them against the Turkish authorities or people in the Slavonic provinces has only served to stimulate them in their efforts to disorganize the country at the expense of the character of the Porte for administrative capacity. Scarcely six weeks have elapsed since a band of Serbians fell upon and attacked some unarmed Turkish soldiers in a cove in Belgrade, massacring seven of them, and throwing their bodies into the Danube, and wounding eighteen. At the same time five other Turks were murdered, at a small town upon the

Bulgarian frontier, with the object of exciting the Bulgarian Turks to retaliate. The Mussulmans were perfectly unprepared for the assault, had offered no provocation, and had not time to defend themselves. The design in Belgrade was evidently to create a disturbance which might induce the Turkish Pacha to fire upon the town, with the view of quelling the riot, contrary to treaty; for by treaty the Turks are rendered powerless to repress disorder in Servia. The Sultan may not march troops into the province, much less use force to repress a revolution, without the consent of the European Powers. Under these circumstances, it is evidently the object of the enemies of Turkey to disorganize those of her provinces in which her hands are thus tied. The recent massacre of Turks in Belgrade was originated with this view, and at this moment there are armed bands of robbers on the Bosnian frontier, which we are entitled to assume are in Russian pay, not only from the confessions of those who have recently been taken prisoners, but from the fact that two Russian standards were found in their possession.

By massacre and robbing the Bosnian Turks, where the Mahometan population is equal to the Christian, it is hoped that the latter may at last become exasperated, and afford another opportunity to the Christian Powers of Europe—and more especially Russia—of proclaiming the necessity of an armed occupation, by Christian troops, of this portion of the Sultan's dominions. In the same manner a band of robbers have been recently captured in Bulgaria. Among them, it appears, was a priest, who made a confession which throws considerable light upon the means employed by Russia to effect her objects in this quarter. It turned out that all the members of the band, though under Turkish names, were Servian Christians, enlisted, not for purposes of robbery, but assassination. A list of the victims was found upon them, consisting of the Christian chiefs of the villages who were opposed to the Russian propaganda. For every chief's head a reward had been offered by the Servian Government. Two luckless Christians had thus been murdered by their co-religionists, their heads sent into Servia, and the money received by the chief of the band.

These are facts which are beyond doubt, and which deserve to be known in this country. We perceive from them, and from a consideration of the events which are every day taking place in Wallachia and Moldavia, where the same system of disorganization is taking place; and the Government is urged to pursue a course which defies not only treaty rights, but outrages public morality—that the ulterior design of Russia is to persuade Europe that the only remedy for the evils which they have themselves caused, is the intervention of Russia, and the occupation of the Principalities by her troops. We have already alluded to a second crossing of the Pruth; nor will Austria be loath, for her own reasons, to assist, upon this occasion, in the operation. It behoves our Government, if we wish to thwart a policy so unworthy, but, at the same time, so dangerous to Turkey, to offer a support to the Government of the Sultan, instead of co-operating, as we have done hitherto, with his enemies in weakening it,—while it is the duty of those who have more than a superficial acquaintance with the East to disabuse the public mind in England of an absurd prejudice against a race who have not progressed so rapidly in civilization as the nations of the West, but who are possessed of a far higher moral and physical organization than that section of the population of Turkey who call themselves Christians, though they are a disgrace to any religion, and are now trading upon the misplaced sympathies of the Christian world. Meanwhile Prince Michael of Servia has inaugurated his accession to office by a proclamation which indicates a desire, on his part, to throw off the Russian yoke, and emancipate himself from the leading-strings of his father's cabinet. We trust that he will persevere in this policy, and that he will find, if he does so, a support on the part of our own Government which may encourage him to adopt a more enlightened and independent system of administration than that which marked the reign of the old prince whose mortal career has just closed.

THE PRINCE'S TOUR IN AMERICA.

THE Prince of Wales has created quite a flutter among the devotees of Transatlantia. Canadian royalty was more fervent than discreet; but the enthusiasm of the Republicans, all the way from Detroit to Cincinnati and Washington, has boiled into a positive frenzy of curiosity and delight. What the degree of heat will mark in the social barometer when His Royal Highness reaches New York, it is impossible to predict. Already the expectation of his advent has kindled a conflict of fierce passions in hundreds of gentlemen in the "Empire City," who all indulge the by no means unnatural wish of being selected by the heir of England to lead off the first dance in the ball, which is to be given in honour of the occasion; and who all indulge a not unnatural, but a very ungenerous enmity towards every fair sister, whose attractions may be supposed to rival or excel her own. It was suggested that Miss Lane,—who is, by virtue of her position as the niece of the President, the first lady in America, and who does the honours of the White House at Washington with a grace and dignity that would well become a

queen,—should be selected as the Prince's first partner in New York. But the proposition was only mentioned to be scouted with angry scorn. The damsels of New York were as indignant as ladies could be, and gave vent to their feelings in expressions, which not even the *New York Herald*, that reports everything, deemed it expedient to publish.

In England, if it were possible that such a question could arise, a whole host of lovely maidens would be thrown out of the circle by the simple fact that they were wives or daughters of grocers, printers, lakemen, bankers, attorneys, &c. But, as in the United States there is no rank except that which money can bestow; and as one lady is as good as any other lady, and only better if she be prettier, younger, or wealthier, the crowd of aspirants for the honour of the Prince's hand in the quadrille, or his arm in the polka, could not be circumscribed within British limits.

Whether the fair ones, outraged by the idea of Washingtonian intervention, held a preliminary caucus, and afterwards an indignation meeting, the world has not been informed; but it seems to have been determined by their fathers, husbands, lovers, and brothers, who have to pay for the ball, that Miss Lane should not be invited—that it was sufficient glory for her to have received the Prince in Washington, to have danced with him, dined with him, and broken him at the game of ten pins. Why, it was asked, having done all these things, should she invade the privileges of the beautiful New Yorkers, who have as much right to dance with royalty, or least it at ten pins, as she had? And so the matter rests as regards Miss Lane, though the gentle but unenvied war rages as hotly as ever with regard to the multitudinous rival beauties of Manhattan. But the Prince is godsend, and will undoubtedly do as much dancing as he can, for his own sake as well as for that of the ladies.

There was at one time a project mooted in America, that the Queen herself should be invited to visit the United States. Had Her Majesty received such an invitation, and accepted it, there is no knowing but what Massachusetts, Connecticut, Vermont, New Hampshire, and Maine, in a fit of enthusiasm, might not have voted their annexation to the old country, and thus got rid of all participation in the guilt of negro slavery, against which some of their orators so lustily declaim. But it was otherwise ordained. The Union remains intact; and the Prince of Wales, exciting no disruption, has only proved to Americans as well as to Englishmen, what a fund of good feeling in reality exists between the two kindred nations, which speak the same language and enjoy the same freedom. One of the most graceful acts performed by the Prince during his tour was his visit to Mount Vernon and the grave of Washington. Our friends the spiritualists, who believe that Mr. Home, the medium, "weighing between you and what's above," can, by spiritual agency, float in the air, over the heads of a water-doctor and several literary gentlemen, writers for the *Cordill* and other magazines, and that he can hold long conversations with the ghosts of the departed, may imagine the sorrow, if not the anger, that the ghost of George III. would feel if it were in Virginia at that moment. Why did not Mr. Home go there on such an auspicious occasion? He might perhaps have brought the two Georges together, and afforded new edification for the readers of the *Spiritual Magazine* and its brother *Cordill*, besides amusing the whole world of English readers. But whatever may be the opinion of the ghosts on this matter, living men in England and in America are satisfied that the heir of the British Crown did well to render respectful homage to the memory of Washington, and to mark in this emphatic manner the difference between the stupid obstinacy of our forefathers and the hale common sense of their grandchildren and great-grandchildren in the present generation. The incident affords a fine subject for a great historical picture. We hope some of our Royal Academicians will look to it.

IRON-CASED SHIPS OF WAR.

THE question as to the superior merits of iron or wooden sided ships of war, though much agitated, is still indeterminate. That much abused body, the Lords of the Admiralty, may well gather courage from contemplating the phase into which the discussion has passed. "Fast-going gentlemen of the British public," my lords may be supposed to exclaim, "you have said your say, you have speculated about the relative merits of wood and iron to your heart's content. What do you make of it, gentlemen of the British public? What are your conclusions?"

Perhaps the best way to advance the argument a stage towards the region of certainties, is to take for granted the existence of iron-cased ships—of a few qualities, the reality of which is still disputed; seeing then, how lies the balance of advantages between iron-cased ships and their wooden-sided competitors? Let the following postulates be conceded. Firstly, that the armadillo system need not and does not interfere with the sailing or steering of a ship; secondly, that the increased weight due to such mailed coating does not prejudicially interfere with the buoyancy of a ship; and hence does not restrict—for any given measurement tonnage—the number of her guns or the weight of them. Granting, for the sake of argument, those postulates, let us

now imagine two belligerent vessels meeting each other in broad ocean, clearing decks, and preparing for action. Demolition of her antagonist is the intent of each; the question is, how to act about it. For the sake of giving our ideas a local habitation and a home, let us choose one of the belligerent vessels in which to take our stand, during the trial presently to ensue between impact and cohesion,—cannon missiles and slabs of iron. We elect to be in the wooden ship. If the iron one be altogether impenetrable, why there will be no effects of penetrating shot and shell to see; and if port-holes, in the ordinary sense of them, be absent, their case supplied by small round apertures, out of which project the muzzles of breech-loading guns, as proposed by the Sardinian Colonel Cavalli, the atmosphere will be none of the nicest.

We elect, therefore, to be on board the wooden ship. Well, the armaments on either side are equal; and as breech-loading ordnance have hitherto been the cyanoise to which the eyes of naval artificers have long been directed, let us assume each ship to be armed with breech-loaders. Each anxious for the fight, we close mutually. A goodly distance yet separates us—say, some three thousand yards. Guns are manned, and all is ready, but no booming roar of cannon rouses old ocean yet. Three thousand yards, and still no broadside; when Mr. Lyndal Thomas's gun, the other day, threw its projectile more than ten. What wanton waste of artillery power is this! Not a bit of it. As a vessel of iron-sided antagonism, doubtless she would be very glad to be hurling some long bolts at us. Doubtless she would be very glad to ply us with shell; not content with shivering our timbers in the old-fashioned way, but bringing to bear the full powers of that incendiary system devised by General Paixhans, and the exercise of which our own wooden walls seemingly court; but from the effects of which the mail-coiled enemy is exempt to a considerable degree. Vain longings all! Be the fact remembered, our adversary has, like our own good ship, breech-loading guns—guns of equal calibre to our own, and of precisely similar pattern. Yet, whatever the size, whatever the power of the iron adversary's gun, their effective range is much less than of our own. Carrying out the idea of hermetically sealing her iron sides as much as possible, the architect of our iron enemy has expensively diminished the size of her port-holes. She can barely give three degrees of elevation to her guns, whereas we can give eight or nine. Hence the effective range of our enemy's broadside is restricted within narrow limits. To what precise distance her shot and shell may go, when fired at an elevation of three degrees, will depend on the size of the gun; but, speaking in a general way, seventeen or eighteen hundred yards will be the limit of their range. So, at our present distance apart—say, two thousand yards—the enemy cannot hit us yet. We could, indeed, hit her—but, *qui bono?* Hitting without penetrating would be of no avail; so we are fain content to draw nearer.

Matters become critical. At length the belligerent vessels, closing still, come within the limits of the iron ship's range. Shell after shell bursts through our sides. Some obligingly go quite through, and reserve the favour of their bursting charge for the air or the waves. Others blow up between decks, doing more devastation than is pleasant to think about.

It is *no vivamus quant' ducere* for us of the wooden ships. To fight we have elected, and fight we will; so, putting a good face on the business, we do the only thing possible under the circumstances to be done—rush in at something like pistol-shot distance, fire a concentrated broadside at the iron casing of our enemy, and finish by boarding, if possible or necessary. Be it remembered that whilst we are firing solid shot at the iron-sided enemy, the iron-sided enemy is firing solid at us. These are alarming conditions—they are unequal; but as guns are, and as shells are, the conditions are inevitable. Very slight consideration of the nature and functions of a shell will make it evident. Wherefore it happens that—whilst any shell, however small, and the bursting-charge of which, however trivial, is a formidable projectile as against wood—only shells of great size and high bursting-charge can be of any avail against thick plates of iron. Artillery, up to the present time, has not been competent to launch shells big enough, and having bursting-charges high enough, to prove formidable either against granite walls or iron casing.

The inherent defect of solid shot is that its latenter or disruptive power is only available at short ranges. The inherent advantage of shells consists in this—their disruptive and incendiary powers are, within practicable limits, almost independent of length of range, and proportionate to the bursting-charge of each. If it be a necessity that artillery must remain just as they are—no bigger, no more effective,—then there is much to be said in favour of iron-mail ships. On the other hand, grant the possibility of constructing ordnance big enough to discharge, at low angles, shells holding bursting charges of 25 or 30 lbs. of powder, then iron-mail plates would be of no more avail against the force of artillery than the cyanoise and broadside of civility against the bullets of Minie and Enfield small-arms. The solution of this problem we believe to be on the cards, and not far distant. Rifled ordnance, capable of launching shells of this size and competence, we believe will be manufactured. Farewell, then, to the pretensions, however real now,

of iron-sided ships. Their present advantage is immunity from shells. Let but shells be made powerful enough to crack the mail plates, down goes the iron ship: a warning to people over bold in adopting passing phases of applied science, and looking upon such adoptions as finalities—unalterable, unimprovable.

MR. RUSKIN'S POLITICAL ECONOMY.

IN a dispute, the ready resource of a woman is a flood of tears; and the asynte to which a womanish man, who has run foul of a scientific truth, and been defeated in argument, readily betakes himself, is a text of Scripture. To show that government (coercion) is antagonistic to co-operation, and that competition is antagonistic to anarchy, and ends in complete co-operation—for while all buyers and sellers contend each to give in exchange for what he wants from the other the least possible quantity of his own labour (the lowest price), all co-operate to feed and clothe the community,—is easy work. Mr. Ruskin's eloquent and repeated assertion, therefore, that "Government and Co-operation are in all things the Laws of Life—Anarchy and Competition the Laws of Death," when analysed, turns out to be the nonsense of ignorance. He flees, however, from refutation by the things of this world, by adding, "I know no previous instance in history of a nation's establishing a systematic disobedience to the first principles of its professed religion. The writings which we (verbally) esteem as divine, not only denounce the love of money as the source of all evil, and as an idolatry abhorred of the Deity, but declare manna service to be the accurate and irreconcilable opposite of God's service; and wherever they speak of riches absolute and poverty absolute, declare woe to the rich and blessing to the poor. Whereupon we forthwith investigate a science of becoming rich as the shortest road to national prosperity."

In answer to this it would not be enough to prove that the rich are not here actually, and on account of riches, full of woe; and that the poor are not actually, and on account of poverty, full of blessing; for, according to Mr. Ruskin, religion affirms that they are now, and are to be eternally. We could argue with him as to deductions from facts, but we cannot follow him into the mysteries of religion. Knowledge and faith are diverse, and we can only reason from what we know. We decline, therefore, further to notice his continued incursions, though they still attract the attention of our contemporaries, who find it easy to show that more silly and contradictory doctrines than his were never enunciated. We can make no reply to his implied "eternal punishment of the rich." Political economists do not strive against "divine writings" which denounce wealth—the substance and strength of nations: they confine themselves to ascertaining and explaining the natural laws by which it is created and distributed. The ancient and the existing laws of property, against which Mr. Ruskin's remarks are, in a true socialist spirit, really directed, though he be too ignorant of the subject to be aware of it, lie expressly and avowedly beyond the domain of political economy. They are incidentally alluded to by Mr. J. S. Mill, rather than adopted as an essential part of the science; but by Adam Smith and his immediate successors they are accepted as existing facts, in subversion to which all their doctrines are expounded. Mr. Ruskin is an example of the danger incurred by public writers who depart from the discreet silence of the economists, and denounce the existing right of property.

SHARP PRACTICE.

ALL persons who have ever insured either their lives or against fire, are aware that in all cases the insurance office gives them notice of the time when the premium falls due. In this notice it is always stated that if the premium be not paid within fifteen days, in the case of a fire insurance, and from twenty-one to thirty days in the case of a life insurance, the policy will be void. It is perfectly clear, therefore, that till the end of those specified days the policy is good. It is scarcely possible for words to make a more binding contract than is implied in such a notice. In fact, however, of this pledge, some shabby insurance companies, the names of which will hereafter be known, have objected to receive the premiums for renewing the insurance on Messrs. Goodhart's premises, recently burnt. They appeared to desire to shirk their responsibility because the premiums were some days over-due, though the end of the fifteen days had not arrived. The circumstance has excited considerable attention in the public, and some alarm amongst insurers, and we cannot avoid lending our aid to restore confidence, and convince both the public and the companies that the alarm is groundless.

Some time ago a Company tried to evade this obligation. A life having fallen in after the premium became due, but before the end of period to which the notice extended, a quibbling objection was raised to paying the sum insured; but it was so promptly met and exposed that the question was not, we believe, brought before the courts. It was denounced as a wrong morally and legally, and an attempt now to repeat such conduct is sheer immoral infatuation. The London and Liverpool Companies at once accepted the responsibility. The instant, too,

the question was mooted, several companies—the Northern Assurance, the Norwich, the Manchester Fire, the Scottish Provincial, and others, hastened to disavow and condemn the intention of ever questioning the responsibility before the termination of the time specified in their notices. After several disavows of this kind, on Saturday, the fire having taken place on Wednesday, the companies implicated wrote to say that they never contemplated repudiating their liability under the notices. The denial came late, and was accompanied by a condition which implied the contrary. They required that Messrs. Goodhart "should give an assurance that they intended to have renewed the insurance without reference to the fire." This was little better than shuffling away from the consequences of their own erroneous proceeding. Suppose a man had, for some reason or other, not intended to renew his insurance, that did not abate the responsibility of the company one day before the expiration of the time mentioned in the notice. Requiring this condition seems to us a subterfuge invented after the companies saw ample reason to be ashamed of their own act, and afraid of its consequences. Had they not become sensible of their error in time, the public would have been seriously alarmed, and insurance companies would soon have experienced a great decline in their gainful trade.

To give an idea of the property at stake on this question, and the business it involves we will mention that the number of fire insurance companies, in 1856—the latest return we have seen—was seventy-seven. Last year the amount of the duty levied on fire insurance was £1,472,445, which at the rate of 3s. in the £100, gives for the amount of property insured almost a billion sterling (£981,628,666), exclusive of farm buildings, which pay no duty. The tax, too, is annually and continually increasing. If we assume that the offices get about one half as much as they levy for the state, and the proportion, we believe, is about 1s. 6d. per £100 to cover the risk of fire insurance, while 3s. is the rate of the Government duty, the gross income of the seventy-seven offices will be about £726,000, and the total amount of the money paid by the public on account of fire insurance will be upwards of £2,200,000 annually. That a more economical means of insuring than paying companies could be devised is not doubted; and the companies, therefore, must be on their guard, or they may ruin their own business. Enough has now transpired to be warning to the public, and market every insurer look very carefully to the character and means of the company with which he insures.

THE EXECUTION OF WALKER.

The condensed wisdom of an old proverb has been again verified. A somewhat notorious picher, by going too often to the well, has been broken at last. Walker, the American filibuster, whose successive descents on Nicaragua, Costa Rica, and Honduras, have, for nearly five years, excited the mingled curiosity, contempt, and disgust of the public, has furnished his last paragraph to the chronicles of the day. All his former failures were made with impunity; his singular incapacity, that always ensured him defeat and disaster, had hitherto, at least, this amount of luck, that, in his own person, he escaped the deserved penalty. It fell heavily enough on others, in the shape of death, disease, and starvation. But from the wreck and ruin of what were called his "expeditions," Walker himself had, till now, escaped scathless; twice he was brought back a prisoner to the United States—once by an American, once by a British naval officer; he had full and repeated warnings that Central America did not want him. But he could not read the lessons of experience. The Fates were kinder to him than he deserved, and he misinterpreted their forbearance. He tempted them again, and the Nemesis overtook him.

Forgetting that each of his former descents had given courage to the Governments of these central states, irritated their inhabitants more and more against him, destroyed his own influence at home, and worn out the patience of the United States authorities, to whom he was a perpetual embarrassment, he made another descent on Honduras, and, in a few days, failed signally, as before. But this time came the punishment for all: he was made prisoner by a small body of native troops at El Negro; taken to Truxillo, and there shot, as a pirate and outlaw. His few wretched followers, not above seventy-five in all, had been dispersed before his capture; only twenty-five were with him at the last; and these, starved, ragged, and wasted by fever, have been liberated and sent to New Orleans. It is quite in keeping with all Walker's acts of inconceivable folly, that his last attempt, when he was weaker in means than ever, should have been made on Honduras, the strongest of all the states of Central America, and just after its Government had made a special alliance with England. In the treaty by which we got rid of our entanglements with the Mosquito Indians, and ceded Belize and the islands of the coast to Honduras, we guaranteed to that state protection and assistance against such piratical attacks, there being British interests involved in the trade of that region, that could not be wholly abandoned. That treaty, with its cession of doubtful jurisdictions, was made in the fairest spirit of deference to American opinion.

The Cabinet of Washington was, we believe, invited to join in the protection extended to Honduras; though the offer was declined the Govern-

ment of the United States was perfectly aware of the change in our relation, with this particular state of the Central American group; and that we have, on the application of the other party to the Treaty, furnished aid and assistance to Honduras against an unauthorized invasion, cannot offend that American public opinion the Federal Government so much dreads. In fact, it is a hopeful sign for the future, to see that the summary execution of Walker is generally approved in the United States; though his force was dispersed, in the first instance, by the intervention of the commander of a British ship of war—the *Zeus*; and his final arrest was effected by the assistance of the boats of that vessel, which conveyed the native troops, though under a native officer, on the river. Party spirit is running high at this moment, in America; and if it would "pay," politically, to raise the old cry against the Britisher, it would be done; but no expression of the kind is heard on either side. The universal feeling appears to be one of assent to the measure, and satisfaction, as at the suppression of a nuisance. There is some regret that the Federal Government should have left the good work for British authority to do, but none that the British have done it. This, and the total failure of General Harney to get up an anti-English excitement, by his seizure of St. Juan, are symptoms favourable—we will not say to peace, for that was never really in peril—but to the growing opinion that vainglorious declaration against England is no longer effective in the tactics of electioneering.

The world is accused of judging too much according to the event; and, no doubt, excess does cover more sins than charity. But of Walker, men's opinions were settled long ago. His first expedition decided it; not by its mere failure, but by the fatuity of his aims, that made the failure certain from the beginning. In the first place, landing among a people of another race, language, and religion, and finding them poor, idle, and personally free, his means of winning support were—selling property, and announcing his intimate intention to make them slaves, and compel them to work! Enforced toil, the one thing the hybrid Spanish race of Central America dreads more than death, was to be their lot under his government. This lost him the only support he could have reckoned on. The hatred of the proprietors he ensured by the cold-blooded murder, or execution, of one of the most wealthy of the class. From his first step to the last, everything an invader in his position should have avoided he did. Only to the weakness of the wretched Government of Nicaragua he owed a rather long immunity. Gradually the several states sank their mutual jealousies, to meet a common danger. Costa Rica sent assistance to its neighbour, and the adventurers, who lived by plunder for the moment, with the threat of enslaving in the future, were destroyed in detail.

The frantic impetuosity of the expedition was wholly Walker's. In the military part of it he sank to the second place, immediately he was joined by Hueneguen, who, to some extent, retrieved his blunders, and brought off the relic of the force from Leon to the nearest. That city was burned down in the conflict, and its ruins are the only traces the expedition left in Nicaragua. The attempts that followed this failed in the very outset, and failed ludicrously. The Federal Government is very weak, and on scarcely depend on its own officers, especially in the South, if slavery is in any way involved in the proceedings. So Walker did get to sea again in the beginning of 1858, and landed on a sailboat on the coast of Nicaragua. Here he was seized by Commodore Paulding, and brought back. He tried some political blustering at Washington, but it did not succeed. Mr. Buchanan justified his office; and Walker sank deeper into discredit. In the following year, another land of "liberators" was taken, and returned to the United States in an English war steamer, Walker again escaping. In these two attempts he was supported by a great steamboat proprietor in New York, who had his own views on the Panama route. But a rival company, we believe, out-manoeuvred him, and seized the lake and river steamer, before Walker arrived. At the worst, there was a purpose of some kind. But this final and fatal expedition appears to have been wholly without an object.

Honduras lies at the southern extremity of the peninsula of Yucatan, where the mainland widens into the Gulf of Honduras, the southern border of Mexico. Except fever and malaria there is little to be got out of the country. What seventy-five men expected to do, in a region that would swallow up an army, it is impossible to imagine. What their leader has found there is death. The measure he meted to his victims in Nicaragua has been measured to him again, and he has gone down to a bloody grave. Men can understand those who die in carrying out a principle, like John Brown, the other day, in Virginia; or the old buccanniers, whose only impulse was greed. But Walker belongs to neither of these; if he represented anything, it was that dangerous class, the impoverished whites of the southern states, puppets in means and aristocrats by caste, who are the most rabid advocates of slavery. It is the worst result of that system, that, by degrading labour, it makes industry impossible, except to those who possess capital; among the thousands of restless, craving, discontented men of the "superior race" that crowd the southern cities, any cause will find recruits if it puts slavery on its flag, and fitting leaders will always be found in such vulgar, tawdry travesties of Pizarro, as Walker proved to be.

LEWIS DENTON—A REASON FOR NOT FIGHTING.—Lord Coleridge (the Colonel Latimer of Middlesex aristocracy) refused to fight a duel with his father, not because he was his father, but "because he was not a gentleman!"

By the Australian Mail we have news from New Zealand to the 6th of August last. It is far from reassuring. In consequence of the insufficiency of the English forces, no attack, of a serious character, had been made upon the natives since the disastrous affair of the 27th of June, although they had been purposely harassed and excited by an occasional shell thrown into the pah, where they are intrenched. General Pratt, who is to conduct the military operations now contemplated, arrived at Taranaki on the 2nd of August. Next day the natives advanced close upon the town, and plundered the outskirts. The utmost consternation prevailed among the inhabitants; and men, women, and children, with despair depicted on their countenances, were hurrying from every quarter to the barracks for protection. The streets were barricaded, and intrenchments thrown up round the town. Orders were issued for the immediate removal of the families of the settlers from the town and the surrounding province; and up to the date of the last intelligence women and children were leaving as fast as conveyances could be procured, Nelson being already crowded with the refugees. It is feared that the insurrection will not be confined to the malecontents of one district, but will spread through the whole of the native population. Referring to the first engagement with the natives, Katipa, a chief, is reported to have said,—"The tide is rising, rising, rising; the governor has set fire to the fern at Taranaki, and the smoke will soon cover the whole island."

The annual meeting of the United Kingdom Alliance for the suppression of the liquor traffic, was held on Tuesday last at Manchester. In the secretary's report, reference was made to the favourable opinion Lord Brougham had expressed of the objects of the Association at the last Social Science Congress at Glasgow. The Dean of Carlisle, Mr. Washington Wilks, and Mr. Ayrton, M.P., took leading parts in the proceedings, proposing and seconding resolutions, which were unanimously carried, to the effect that the principles of the Alliance agitation are in perfect accordance with social science, political economy, and Christian philanthropy, and that Parliament should confer upon the people a power enabling them, by the vote of a sufficient majority of the ratepayers in any district, to exclude from such district the sale of intoxicating beverages.

The executive committee of another association of older standing, the Ballot Society, have issued a circular stating their plan of operations for the coming session. The hopeful view they give of the progress of the agitation is confirmed by Sir John Bowring, in a speech which he delivered as honorary president of the Exeter Disfranchisement Society, at the opening of their winter session, on the question "Is the Ballot a security for honest Representation?" Sir John admitted that his old political creed had undergone some modification, he being now inclined to admit that serious objections may be urged to universal suffrage and annual parliaments.

The sympathy of this country is not altogether on the side of Garibaldi and Victor Emmanuel. How could it be otherwise when the friends of the Pope are so numerous? A requiem, the most magnificent of its kind since the obsequies of the great Liberator in 1847, was celebrated in the Roman Catholic cathedral of Dublin on Friday week, in honour of the Irishman who fell in the recent campaign, under Lamoriciere. After the office for the deed and high mass had been said, Archbishop Cullen preached a violent sermon, in which he denounced Garibaldi as a pirate and freebooter, and ascribed the praise he has met with from the press to the fact that he has pandered to English bigotry and hatred of Catholicity, and shown his tendencies to Protestantism by scolding his son to be educated under the care of an apostate in England. This demonstration in Ireland has been followed on the British side of the Channel by a meeting of Roman Catholic clergymen and gentlemen, held on Tuesday last in the Hanover-square Rooms, to open a subscription for the purchase of a sword of honour to be presented to General Lamoriciere.

A committee having been appointed to promote the scheme, including several of the most distinguished and influential of Romanism in this country, a letter was read from Lord Feilding, in which he expressed a hope that special notice would be taken of the brave Irishman who had behaved so heroically, and who had come in for so much infamous calumny and opprobrium.

Mr. Train, the enterprising American, who some time ago opened the street-railway at Birkhead, has made application to several of the metropolitan parish authorities for permission to lay down rails in the thoroughfares of London. He offers to construct the lines at his own cost, to the satisfaction of the district surveyor, to complete the work within a specified period under penalties, and at any time to remove the rails should they prove an obstruction or inconvenience.

On the 22nd ultimo, the Prince of Wales left Chicago for a shooting-box in the prairies of Illinois, where he spent a few days, and exhibited such skill in the use of his rifle, as to gain the reputation of being the best sportsman of his party. On the 4th of this month he reached Washington. Next day he descended the Potomac, to Mount Vernon, the residence of Washington. Having visited the gardens and house, the Prince stood reverently uncovered in the room where the great patriot and statesman breathed his last. He afterwards, at the request of the Mount Vernon Association, planted a young hore-hoestant tree on a mound near the tomb of the first President, to commemorate a visit which indicates so strikingly the change which has taken place in the opinion entertained in our day by the English Court of the great founder of American independence.

Her Majesty returned from Germany on Wednesday, having arrived at Gravesend in the afternoon, a few hours later than was anticipated.

MONEY AND COMMERCE.

THERE was a general expectation in the early part of the week that the Bank of England would raise the minimum rate of discount to 4½ per cent. The usual day for making such an alteration (Thursday) has, however, passed and no change has been made. The condition of the Bank, as set forth by the returns of the previous week—to which we directed attention last week—does not seem to have been much improved, according to the returns of last week. It is true the Reserve was increased by £156,165, but the bullion was decreased by £141,175, and the increase in the Reserve was entirely caused by the increase in the private deposits, of £867,222. In fact, the customers of the Bank had been alarmed at the probable want of money, and had collected it from different quarters and placed it in the Bank, to be ready at their command. An increase of private deposits, therefore,—which may be called for at any moment,—while adding to the strength of the Bank. The returns of the present week, including the payments of the dividends, cannot be otherwise than extremely unfavourable. In addition, also, to this cause for dear money, the Bank of France, according to the returns for October, has parted, in the preceding month, with nearly £3,000,000 of gold—an indication that the present demand for the precious metals to be sent to maintain comparably backward in civilization, for the purchase of grain, is not confined to England.

The condition of our own money market, and the causes of the change, are well described in the following extract from the letter of a City correspondent:—

"Our cash has first absorbed the gold in Paris, and now we have to send it there. The Chinese expedition of France and England requires a large export of Mexican dollars. Both these circumstances have necessarily produced a large quantity of bills on London, which the French establishments hold, in their portfolios, to be thrown on the discount market here to pay for this coin. If I were to advise the Bank, I should recommend it to go to 5 per cent. at once, it would prevent a higher rate by-and-by. We must import an enormous supply of corn till next harvest, and prices will, I believe, improve materially. We have a deficiency of 30 per cent. at least in our crops, and an advance of 30 per cent. in prices. That must tell on our cash. Many people have provided themselves at the Bank, for fear of a rise in the rate. The joint-stock banks will only take short bills at 4 per cent., and everybody is very cautious. The French Exchange keeps very high under these circumstances. A great deal of the gold sent to Paris goes to Spain for coin and railway purposes."

Under such circumstances it is perfectly plain that the rate of discount will advance, and we conclude that the Bank only waits to see what will be the effect of the payment of the dividends in supplying the immediate wants of commerce before it makes any alteration in the rate of discount.

The funds have had a downward tendency this week, solely from the condition of the money-market. There is nothing in the political world to account for the decline: Consols have been down to 92½, but closed on Thursday at 92½. The decline caused by the increased value of money is likely to continue, and must be distinguished from a speculative fall. The public should, indeed, always remember that the chief public funds have two prices—the price at which the public will invest money in them according to its present value, and the more fluctuating price determined from day to day by the speculative demand.

The present decline is due to money having increased in value, and more can be made by it in other channels than by investing it in the funds. We see the effects of these different prices in the relative change which has taken place since this time last year in the price of the English and French funds. Throughout this period the latter have been much more affected by speculation and political causes than the former, nevertheless the English funds are now 3 per cent. lower than last year, while the French funds are within 1 per cent. of their price then. The price of both has been more influenced by the value of money than political causes, and they approximate to one another. Railways have maintained a firmer position than the funds, and some of them, especially the Midland, have advanced. They are of course not so immediately affected as the funds by a rise in the value of money, as it is the funds generally in which the money destined to serve the purposes of trade when it is invested.

The bonds of the Atlantic and Great Western Railway lately offered here have, we understand, found a ready market.

Trade continues dull. The markets, particularly the country markets, have been well supplied with corn; but the price has, nevertheless, had an upward tendency. At Newark, in the week, five white wheat sold for 7s 4d, and 7s 4d. Considerable quantities of foreign corn continue to be imported, and its payment is going out, and will continue to go. The corn markets have not been active. Other markets have been in similar condition. The news from India and Australia is not favourable, and trade in the manufacturing districts is rather slowly than active. For cotton the demand continues in full vigour, and the sales at Liverpool are daily very large. The accounts from the United States do not justify any apprehension of the present crop being in the least deficient. The sales of tea have been large in the week, and the prices have turned rather in favour of the seller.

All the markets continue to be reasonably well supplied, and there is a great consumptive demand, but no speculation. If trade be dull, it is sound. In the cattle market, benefits are abundant, but they are generally in an inferior condition.

The shipping interest of Europe especially of England, which has long directed its attention to the subject, has learned with satisfaction that the State tolls on the Elbe, are at length to be abolished. Hanover has long resisted this change. Negotiations to bring it about have at length succeeded. Hanover consents to give them up for a sum of money equivalent to fifteen years purchase, £260,000. Of this sum Great Britain is to pay one-third and Hamburg one-third. These two countries have the greatest interest in the matter, through the shipping of Hamburg has long been exempted from tolls. The remainder of the sum is to be paid by Holland, and some minor German States. As soon as the money is paid these tolls will cease, and another step will be made towards complete free trade.

THE GOUTY PHILOSOPHER.—No. XV.

MR. WAGSTAFF CONTINUES HIS DISCOURSE UPON VALUES AND UPON SOME VALUABLE, NOT HITHERTO CONSIDERED OF MERCANTILE OR OF ANY OTHER ACCOUNT.

The personal Values, which I mentioned in my last, are, after all, but small and mean values. They are of the individual, and appertain to his case exclusively. There are nigher values, of which few or none take account, because men are like worms in a garden, that know their own earth-holes and no more, and cannot see to the uttermost limit of the garden wall, much less to the whole universe that stretches beyond it. Intellectual, moral, literary, and religious values, exist everywhere. The whole harvests of the world for any one year may be valued, if not to a penny, to a million. Of corn, wine, oil, grass, and all the rest, we may have the account within a few hundred thousand pounds—but who shall value Euclid, and the great, invincible, unvarying Nature on which Euclid is built? Euclid is not the harvest of our year, but of all the years. Euclid is based on everlasting truth, and shall be true though the harvests fail, and though Nature, faithful no more to the sowing, should disappoint the reaping. Value all the civilisation of the world. Calculate the worth of London, Paris, Vienna, Berlin, Venice, Milan, St. Petersburg, Hambourg, Liverpool, Manchester, Birmingham, Dresden, Munich, Madrid, Naples, Constantinople, New York, Washington, Calcutta, and Canton; put them in the scale against gold and diamonds, and tell us in pounds sterling what they are worth, with all the broad lands, and navigable rivers, and teeming coasts around them or near them, and when you have made up the account—houses, lands, gold and silver, chariots and horses, silks and velvets, corn-fields and vineyards, men and women,—tell us the value of the Sermon on the Mount, of which the whole of them, with the civilisation that is their mother, are the direct progeny and result.

Philosophers have weighed the whole earth; and though the task seems far more presumptuous than it would be in a fable to attempt to weigh Gog and Magog, or a snail to poise the Pyramids, the thing has been done. But who shall weigh, measure, or estimate the value of Love? Love, the tangible and intangible—the invisible, yet palpable—the ever-present spirit that vivifies and maintains sun, earth, and stars, and without whom Chaos would come again! The value of Love is the value of the universe—more, not less. So thought David and Bathsheba—so thought Paris and Helen—so thought Antony and Cleopatra—so thought Abelard and Heloise—and so, for a brief season, I have thought every pair of true lovers from the days of Adam to our own. When they cease to think so, the world has lost the adorning garment of its beauty, the glow has departed from the face of Nature, and a divine music vibrates no more in immortal melodies through the universe into the heart and soul of man and woman. It is easier to weigh the earth than to value true love, even to the experience of one individual. The worth of Love! The phrase has as little meaning as if we said—"The length or breadth of Infinity."

But of all the spiritual values, those pertaining to Literature are the most scurvily treated in a world which piques itself upon never giving more for a thing than it is worth; and which is not to be inveigled into paying fancy prices, unless, perhaps, it be for singing-men and women, or dancing-girls and mountebanks, and occasionally for the luxury of possessing and looking in the face of some battle-winning emperor. It cost Gibbon far more for the purchase of books to weigh and investigate the facts of his immortal history than any enterprising publisher was able to give him for the copyright. When Milton received the first instalment of £3 for "Paradise Lost"—all the money he ever touched for the labour of years,—the publisher thought he had made a very bad bargain. If Milton were now alive, with another epic poem, even better than that, it is doubtful whether he would receive five farthings for his handiwork, or whether any publisher would look beyond the title of his poem. If he did, perhaps it would only be to tell the bard to publish at his own risk—to pay for the paper, the printing, and the advertising, and let the publisher have his fat percentage upon all of these, with twenty-five if not thirty-three per cent. for the retail dealer,—ten per cent. more for the publisher's commission, over and above all other charges and losses—and when all was done, the great bard might perhaps find an intelligent public, numbering seven individuals—or possibly only three,—to purchase his book and read it. In the open market the copyright might not be worth a quatern loaf, but the poem might be an honour to literature and to the nation. "Paradise Lost" was in one sense dear at five pounds down, and two other sums of five pounds at specified periods thereafter. But in another sense it would be cheap at a million sterling. The war in the Crimea cost England at one time as much as a million pounds a month in powder and shot, food and provender, pay and appointments; but was one month of that business worth half as much as John Milton's poetical genius, and his legacy to the English language—either in national glory or true honour?

There is no power, state, corporation, or individual in the world to pay for noble thoughts. The highest efforts of the poetical or philosophic mind may have no commercial value. They may be utterly beyond the comprehension of the age in which they are produced. They may run counter to its prejudices or a superstition; and, as in the case of Socrates, may be paid for with a poison-cup; or, as in that of Galileo, with the dungeons of the Inquisition. When a man makes a coat, a shoe, or a speck, and offers them for sale, every one knows the value of his articles, and a purchaser will sooner or later be found. But when a man makes a song, who knows what it is worth? If it

be very bad, very vulgar, and very comical, he may possibly make a day's, or even a week's, subsistence out of it; but if it be too noble and elevating to be to the taste of the tavern and the boozing-shop, and beyond the capacity of the music-shops, what avail is it? Nothing. It is not a necessary of life. It is not even a luxury. Nobody wants it. And if Robert Burns wrote it, he must tramp over mire and mud, with pistols at his belt, in pursuit of smugglers, gauge whisky-barrels, and be smothered by his superior in office for daring to have an independent idea in his head, and to write such treason as "A man's a man for a' that."

In the higher state of civilisation to which the destinies of our race seem tending, and which the wars of despotism on the continent of Europe may retard for a while, but which they may not utterly prevent, and which, even if they should prevent in Europe by relegating the whole hemisphere to barbarism, would find a birthplace in America, men will perhaps become wise enough to look after and foster the genius that is uncommercial, and provide intellectual work for the intellectual worker, so that he may live by his labour and pay his butcher, his baker, and his candlestick-maker. In that day the Miltons who arise may be crowned by the people at the Capitol, and cared for at the public expense, so that their days may be days of pleasantness—and the sweet singers of the nation—the bards, the philosophers, and the prophets—elevated above the hard struggle for daily bread, may shine undimmed in the serene centres of their own genius. It is said by human parrots that we have already reached this height of civilisation, and that the public—the great, intelligent, thinking, reading public—for whom books are written and printed, allows no genius to starve in our days; that it is the patron of merit, buys the best books, and therefore pays and maintains the best authors. But the parrots are wrong. The fact is not so. The public likes to be amused. It pays handsomely the mountebanks and the buffoons of literature. It loves the man who makes it laugh; it even loves the man who makes it weep, and has almost as much affection for tragedy as for farce. But it has small affection for the man who instructs it; none for the man whose wisdom and genius are too far beyond the commonplace of fashionable talk or prejudice to be readily appreciated by the mocking-birds. The most industrious of our readers are the idlest of our people, because they read for amusement alone. They must not be made to think too deeply, for they are incapable of the effort; they can scarcely think at all. What cares the general reader for John Milton, who, taken for all in all, was the highest example of the literary man that England ever saw? He would have to keep school again, if he were alive now; or write leading articles for a daily or weekly newspaper. He would stand no chance against the popular novelists. "Paradise Lost" would not please the ladies, who lip their admiration of the spasmodic, the misty, and the insane poets; and "Comus" would be sneered at by critics who love unwholesomeness better than health; and find the Traviata a much more interesting person than Ophelia.

It used to be said in ancient days, and the belief still lingers among our people, that in fair stand-up fight one Englishman can any day beat three Frenchmen. The saying may not have been strictly true, but its general acceptance and the impression of the people that it was a truth, irrefragable and firmly established as the rocks, did certainly, in bygone wars, tend to make an army of five thousand Englishmen as strong as if they had been fifteen or twenty thousand. It was a faith and a fanaticism—and battles were won by it. Another saying used to be, that "an Englishman's word was as good as his bond." He who first uttered the noble boast was a public benefactor, and every man who repeated the aphorism, and believed it, furthered a good work, and helped to build up the structure of his country's greatness. Were the commercial value of the belief to be estimated at no more than that of all the exports and imports of Great Britain for a twelve-month, it would be a palpable depreciation. British enterprise has been nurtured upon it. British commerce has grown rich upon it. British trade rests upon it as upon its stony foundation. Thus may we see, and thus may we illustrate, by thousands of other examples, that there are moral, intellectual, and religious values, which far transcend the physical, and disprove the common acceptance of the aphorism that—

"The value of a thing
Is just as much as it will bring."

Yet this aphorism, vulgar as it appears, has its spiritual side. The value of a thing is really and truly what it will bring. The Sermon on the Mount brings Christianity and all its civilisation. Sunshine and rain bring the harvests of the world; pure air brings exercise; and temperance health. Noble thoughts bring noble deeds. All we have to do is to refrain from valuing everything by money; for money, as we have seen, may be of no value. It is not a fair measure for anything but itself; or for anything but that which a man eats, drinks, wears, and is sheltered with. You may put corn in a bushel, or wine in a hogshew, and the bushel and the hogshew shall be representable in hard cash, or a promise to pay. There is weight for weight, and measure for measure. But you cannot hold a balance in which gold, silver, or copper shall be on the one side, and Truth, Virtue, Honour, Health, Contentment, Love,—Poetry, Philosophy, or Religion on the other. There is too great a tendency in our time to make the money value the gauge of the moral value; to consider a man respectable merely because he has a fine house; and in carriage, and gives good dinners, to make him worthy; because he has a worth in cash, and not because he has any worth in the old sense; not because he has virtue and intellect; and not because he has the manly right of being called your worthily.

MEN OF MARK.—No. VI.

THE RIGHT HON. B. DIAMIEL, M.P.

"It is this etheric bloom of healthy blood, or a false pigment artificially laid on?"—*Peller*.

It was said of Charles James Fox that he made himself a great debater at the expense of his audience. The senator of Queen Victoria's reign knows what is implied by this pregnant assertion. He can imagine the talk at Brooks's or the Cocoa Nut while the process was going on. "Who is up at the House?" "Fox." "A good speech?" "No; dull." On other nights the querist would be told that the great Whig debater was "laboured," or "rather good." On great occasions his net speeches would be impetuous, original, and brilliant; but as an opposition leader is expected to address the House on every subject out of which political capital can be made and the Government damaged, Fox's speeches oscillated between "heavy" and "brilliant" for a series of years, until the English Demosthenes stood contented. He "had made himself a great debater at the expense of his audience."

If the late Mr. Liston had insisted on satisfying the English public that his *fort* was tragedy and not comedy he might have gained his point, but he would have passed through a weary transition period. Tragedy would have laughed at him, and Comedy looked grave. Reminiscences of his *Past* *Pr* would have outraged into *Coriolanus*. We should have detected a comic twinkle of the eye in *Othello*, suspected an unctuous survivor in *Hamlet's* soliloquy over Yorick's skull, and sworn that *Rolla's* tongue was in his cheek in the child scene. Only by degrees could he have tested down the culmen of his forced lunacy. He must have kept strict watch over his facial muscles. A certain settled and hopeless passivity would have stood him in best stead, signifying that there was a time when he took an interest in subsidiary affairs—the time now happily past and gone. In the process of years every spark of the *com* time might have been stamped out, and a certain dreary exterior elaborated for the gaiety and intelligence natural to the man. Seeing that Liston, the tragedian, believed in himself, the public might have come in time to believe in Liston, the tragedian.

Of course no parallel to such a supposititious case can be found among the politicians of our day. Yet, gentle reader, if you had ever been known as an impetuous, poetical youth—if it had been your ill-luck to win a reputation as a novelist—if it had been your *opportunity* to describe the passion of love, and to make Vivian Greys and Henrietta Temples talk more delicious nonsense in their *the-Attes* than any other writer of prose fiction—if you had seen your heroes delight in bamboozling stupid and solemn, but noble and influential Cabinet Ministers, and showing them how rash fancy and originality could be carried into politics—if, with all these dangers, if not fatal antecedents, you had devoted yourself to political life and been called upon to lead a party, what sort of line would you take? What kind of bearing and demeanour would you prescribe, for example, if you found yourself at the head of a rustic and boisterous brotherhood? Your wit and genius might be all very well, as long as you were an irregular, and waged an independent guerilla warfare. But suppose the country gentlemen made you their mouthpiece, asked you to clothe their mounds in articulate speech,—to become, in fact, a Protectionist leader and a Conservative statesman? Why, you would naturally cultivate a decent severity of mind. You would discard figures of speech in favour of figures of arithmetic. You would show a marked preference for fact over fiction. No human being would believe that you could be both brilliant and safe; and having to choose between the two, you would throw in your lot with decent brevity and the respectability.

With the change in your thoughts and aspirations would come a corresponding alteration in your outward man. Your gait would be slow and staid, your features impassive. You would no longer "hang your head upon your sleeve for daws to peck at." In no long time, your face, once ardent, intelligent, varying with each passing emotion, would become as heavy and inexpressive as the face of a snail. Hardest of all, the eye that once burned with passion, and leamed with animation, must be turned inward and so schooled that the political opponent should be unable to detect from any sudden gleam that he has laid himself open to your rapier's point. After twenty years of such "organized hypocrisy," or hypocrisy of the organs, none friend might one day bring you before a portrait of yourself painted by your more brilliant novelist, the hero of your own love stories, the ideal of "gilded saloons," the poetical dreamer, and the gifted enthusiast. When you regard this image of your former self, and consider that you are now the outward impression of a safe and stately plodder,—that your features breathe an emanation of blue books,—that you are an incarnation of statistics and political economy, the difference will not be greater than is observable between

The wondrous boy
That wrote "Alroy."

and the Man of Mark whose name lends this article.

Diarmid, the politician, is the antithesis of Diarmid the novelist. His life is an unfinished fairy tale, which has been sent home from the binders with a hundred pages of *Harvard* for *démolition*. Which, then, is the real Diarmid—the mercenary, gay, gallant, careless, witty, Mercurio of William the Fourth's time, or the grave, thoughtful, matronish politician of impenetrable features, who ever and anon goes to the Court of Queen Victoria in the gold robe of her Chancellor of the Exchequer? No two personages can be more unlike, and one, it may be feared, is a sham—an unreal personage—an actor on the world's stage. Or is our novelist a person of such rare Balzacian verisimilitude, that without any lapse of personal identity, he can write like Fielding all the morning, and speak like Burke half the night? An Asian mystery!

We have all heard more than enough of the young Diarmid's oratorical failures, and his prophecy "the time will come when you shall bear me." Perhaps his exaggerated gestures and wild and impulsive manner, more characteristic of the man than the "heavy father" tone of oratory into which the young politician afterwards throws himself, and now effaces. The recollection of our M.P.'s is much at fault if they have not passed through many dreary Sessions of

hesitating Parliamentary commonplace and law-harism of the school of Lord John, as the penalty of the laughter and derisive cheers which extorted the prophecy of the member for Madras. Like connoisseurs with a later Wilkie, they would like to batten the Eastern development of the man for a specimen of his earlier and more natural manner. Yet the war-paint and the swartness of his "red Indian of debate," have been seen across the table of the House of Commons at certain excited moments, when the heavy and somewhat solemn dullness of conventional debate has been broken through. It may be doubted whether Sir Stephen's ever witnessed more impassioned gestures, or a more vehement burst of scorn and defiance than were extorted from the author of "Vivian Grey," when he stood at bay against a hostile House of Commons in the autumn of 1862. Being lastingly recommended to amend his Budget, after the manner of the Whig financiers, and reminded that Mr. Pitt had not dissuaded to alter his financial schemes, he replied, "I do not aspire to Mr. Pitt's fame, but I will never descend to the degradation of others." The fingers of the right hand shaken with a loose stir at Sir Charles Wood, the notable financier who had preceded him, the muscles of the body in a violent state of tension, as if the excited orator was about to spring across the table at his enemy's throat, amid the wild cries and frenzied excitement of his adherents, and the clamour raised by his opponents, made up a midnight scene that will not soon fade from the memory of the spectators. It seemed to some worth a century of stagnation and decorous dullness. Others declared that it gave as a glimpse of the real Diarmid, that the tonalities were the same that glittered above that "head of an organized hypocrisy," who "found the Whigs looking and made their clothes,"—of that "great millstone man who lambasted one party and plundered another." It was said that the temper was as true and the edge as keen as in the session of 1841-5, when Peel's future successor began to develop powers of sarcasm till then unsuspected. The charm was working.

The young orator's prophecy has been signally fulfilled on two or three remarkable occasions. On the 30th April, 1852, Mr. Diarmid, as Chancellor of the Exchequer, passed a "little gem" of finance with *déjà*. A few months afterwards certain mysterious financial projects that had been "looming in the shadows" were put out by the same Chancellor of the Exchequer, in a speech of five hours' duration. The time had come when they were as eager to hide as to be spoken. On the last day of February, 1850, the anxiety to be present in the House of Commons was unprecedented. As early as eight o'clock in the morning, "strangers" arrived with orders for the gallery. By ten o'clock there were sufficient to fill the Strangers' Gallery; yet, from this hour until four, when the doors were opened, crowds of candidates for admission, armed with members' orders, continued to arrive. For the Speaker's and Ladies' Gallery the Sergeant-at-Arms' book had been opened on the Monday previous, and by eleven o'clock on that same morning every place was taken. The excitement pervaded the working classes, who assembled in New Palace-yard. The interior of the House was most inconspicuously crowded. Some peers who sought admission were turned back. A Prince of the Blood Royal, half a dozen Foreign Ministers, and many leading members of the Upper House were among the audience.

The prophecy had now reached its perfect and complete fulfillment. The young novelist had passed into the statesman. He had again donned the robe of Her Majesty's Exchequer, and at half-past four the Minister, for whom the most distinguished assembly in the world waited in expectancy, walked up the floor, carrying a red despatch-box. In a few minutes he was upon his knees, expounding the Reform Bill of the Derby Government.

"The time will come when you will hear me." It was a true saying, and the thoughts of his audience were irresistibly carried back to the day when the sensitive youth uttered under the laughter excited by his eccentric manner and impulsive action. It was said by one of the older members, that he was attired, at this moment of his triumph, exactly as when he sat down, a quarter of a century before, overwhelmed with confusion and vexation, after hurling his famous prediction at the heads of his hilarious and incredulous audience. He certainly resembled, more than usual, his portrait taken about that time, before he had schooled his romantic features into the passionless air of the party leader. It is hardly possible to be so deeply brown or grey as Diarmid was when he sat down at his triumph in 1850. A black surcoat, artistically made, concealed a white waistcoat, a quiet dark-brown trowsers enveloping the rather man. The deep white collar (no all-round, or shallop dog collar, but canonic with a flow of line), and the black neckerchief, fastened with easy careless negligence, carried the spectator back to those days of halcyon innocence when the fashionable novelist was writing "Young Duke," and was only *imagining* how easy it was for a young fellow, with parts and invention, to open the political world like his oyster. The time had come when not only the House of Commons, but every European statesman was to hear him. Every telegraphic cable, from Moscow to St. Petersburg, was waiting, it was said, on that eventful night, for the "click" of the wire that was to give him work to do.

The orator was pale, but perfectly self-possessed. His voice at first was low, calm, and unimpassioned. With a voice inferior to Gladstone's in richness and fulness (as, indeed, whose is not?), Diarmid has, more than any other speaker, studied those modulations of pitch which give constant pleasure and relief to the auditory nerve. His tones ranged through all the notes of the speaking, and some of the singing voices, with a pleasing and skillful rise and fall, that evoked a fine musical ear. Thus it was that his audience listened to him for three hours and a quarter, without any other sensation of monotony than was inevitable from disclosures that morning forestalled, and a want of condensation in the language employed. When he sat down he won a hearty and general cheer from every side of the House, which had nothing to do with the merits of his Reform Bill, but was a general acknowledgment of his ability, and his modest bearing. Men differed from the politician, but they honoured the prophet, and glorified in the minister the institutions of a country that does not withhold her highest prizes of political influence and power from men of genius, whatever their rank or descent.

It was a saying of Cardinal Retz, "Je suis personnel, qu'il faut de plus grande qualité pour être un bon chef de parti que pour être empereur de l'Europe." That Mr. Disraeli's qualifications for the leadership of his party in the House of Commons should be unanimously conceded by men who differ so widely among each other, is not to be expected. Yet when, during last Session, he became the subject of Lord R. Cecil's caustic invective in the *Quarterly Review*, and was charged with an unlucky facility for upsetting his party in a ditch, the blow recoiled upon its author, and Tories and Liberals vied with each other in vindicating his claims to the distinction of the Conservative leadership. But for Mr. Disraeli the Conservative party might have committed itself hopelessly to a crusade against public opinion. Ridding, as its opponents professed, unpopular opinions, Mr. Disraeli contrived to keep it upon the threshold of office. A turn of the wheel—the defection of a few radicals from the Whig Government—a scratch vote—and Lord Derby is again. Meanwhile the Government can carry no great measure to which the Conservatives are strongly opposed. Lord John's Reform Bill went to the wall. The Paper Duty Abolition was nullified out in the Upper House. The great constitutional right claimed by the Lords to throw out a taxing bill and assist in regulating the finances, elicited nothing more than a protest from the Premier, and a little harmless bluster. The Church Rates Abolition Bill is still in the limbo of measures yearly discussed. Mr. Disraeli was blamed for bringing in a Parliamentary Reform Bill, but he has, at least, prevented the Whigs from claiming a monopoly in the amendment of the representation, while in the principle of enfranchising intelligence and frugality, where Lord John Russell only thought of tricks and mortar, Mr. Disraeli's plan will bear an advantageous comparison with any previous proposal of Reform.

Lastly, Mr. Disraeli has been of invaluable service to his party, in securing them a free hearing from the Press. When the news ran along the Strand and Fleet-street that the Tories were in power, the time was when almost every metropolitan editor of influence sharpened his pen, and prepared to do battle against their *poor creature* of the human race. Now, when the Whigs go to the most influential journals here the news without much concern, and wait to see what Mr. Disraeli and his chief in the Upper House mean to do. While Lord Derby, with patristic insolence, flouts the Press, disavows his own organs, conceals no support, and acknowledges no enthusiasm, his more judicious and discriminating colleagues carefully watch the newspaper barometer, shape his course accordingly, reef his sails when danger threatens, and puts his helm about, like an experienced pilot, who knows all the rocks and shoals, the tides and currents, of that difficult navigation for the old boat-stump Tory. It is true that the Earl of Derby is the nominal head of the party; but remembering the lion's share of influence enjoyed by the House of Commons in the government of the country, we shall not greatly err in assuming that the advice and suggestions of the leader of the Conservative party in the Lower House exercise great influence in shaping the decision of its acknowledged chief. It must ever be remembered, to Mr. Disraeli's honour, that his support of Jewish Emancipation was earnest and consistent, when, if he had consulted mere party interests, he might have trod with his convictions; and it is no small proof, at once of his courage and influence, that Lord Derby yielded to his spiritual remonstrances, and permitted Baron Rothschild to pick his seat.

Mr. Disraeli, apart from politics, is a general favourite with the House of Commons. His defence to the Articles of the House is marked, while his courtesy to individual members is exquisite. Although a master of invective, he never makes an enemy in debate, since he indulges in no personalities, always hits above the belt, and plucks his man according to the strict rules of the Parliamentary duels.

Pittacus says: "I would divide the life of a statesman into three ages. In the first, he learns the principles of government; in the second, reduces them to practice; in the third, *displays* them." Sir Robert Peel had scarcely attained to this last and ripest age when he was called to his rest. Mr. Disraeli has perhaps not yet emerged from the chrysalis life of the second, but he has intelligence, patriotism, and the addition to "have a name which after ages shall not willingly let die." It has been often remarked, that when the confidence of circumstances calls for energies, the energies are ready to the call. That Mr. Disraeli will be equal to his destiny, his genius forbids us to doubt. As Schiller nobly and faithfully says, he will "grow with the circle in which he moves."

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

The political weather at home is fairly settled. The Queen has returned. The ministers are all coming to town, with the exception of those who are in the far West end in the Chiswick Palace. Summons were issued on Monday for a Cabinet Council to be held on Thursday next, the 25th instant; but on Tuesday fresh summonses were sent out, calling the ministers together for Saturday next, the 29th, which is sooner than usual, as the cabinets have been seldom resumed before November.

Qualities at home and abroad will discern something alarming in this anticipation, whereas it probably means nothing at all. The scenes enacted in Europe, especially in Italy, are enough to excite attention and concern amongst the politicians who are intrusted with the reins of Government; and it need not cause any surprise to find the Cabinet called together before the time for discussing and maturing the business of the next Session of Parliament.

The arrival of the Foreign Secretary is naturally looked to by his colleagues as a favourable opportunity to learn the state of the public mind abroad, at least in so many of the public men who have a voice in the conduct of continental affairs. The *Prussian* papers come out rather too formally as to what they are pleased to call "the conferences that have taken place." I believe there were no "conferences" whatever, beyond some short conversations at Cologne

between Lord John Russell and the Foreign Minister of Prussia, who happened to be brought together in consequence of the merely social and friendly visit of the Queen to several members of her family abroad.

We look with some suspicion upon these foreign conferences, for they too often have been the forerunners of some embarrassing or entangling alliance, or the precursors of a large expenditure of the blood and treasure of Englishmen, in some cause for which our allies ought to provide for themselves.

I gave you my version of the Warsaw Conferences last week—that they were merely meant to be cautious and defensive. However, it would be well if Italy were settled into union and strength before these suspicious assemblies take place. The talk of a division of a domain on the part of the French Emperor to join his imperial and royal brother in the ancient capital of Poland. I can scarcely believe it; and, at any rate, I am glad that England will not be found in that gallery. But the presence of a Napoleon there may, perhaps, augur well for the continuance of peace, which it may bode no good to the cause of Italian freedom.

Napoleon III. is inevitable; but he sometimes reminds us of a marriage of an old uncle, who makes a point of dropping in whenever we have a cosy bachelor party,—an acquaintance whom we rather dislike, but who, finding our chambers a convenient resting-place, insists upon being a constant visitor, notwithstanding all our hints to the contrary. He took Baden by surprise; he is now going to storm Warsaw. When two or three are gathered together, down he is sure to drop in the midst of them. It will be a curious sight to see the reception he meets with from the dear friend whom he esteems so highly, and whom he thrushes and coaxes to walk to Solferino; from the laughing Muscovite, who thought himself safe in Poland from such intrusion between the viand and his nobility; from the Regent of Prussia, not less hospitably than either, who as a German hates, as an honest man despises, Imperial France.

There is one sanctuary he cannot violate. Finding their drawing-rooms invaded, their digestion disturbed, the privacy of their cabinets no protection, they may follow the example of Mr. Carlyle's philosopher, or Sam Slick, of Shilville, Esq., and go to bed. They may "bungle," they say in Wales. Napoleon III., though he may insist upon dining with them, and dancing with them, and even deluding with them, is a tiny *monstrous creature* to pretend to sleep, even with the sleep-headed Majesty of Austria. The forcing himself thus upon unwilling hosts, shows that he has not read his uncle's history aright. There he might have seen that with powers of fascination at least equal to his own, the dear friend whom Napoleon I. made at Erfurt and elsewhere were those who in the end became his bitterest enemies. Warsaw is a long stage on the road to Moscow, and the Spanish proverb may again be verified, that "Many go for wine, and return asleep."

My first guess was that Mr. Wilson's successor in India was some pensioner upon Mr. Leing gone to Calcutta. Lord Derby, formerly M.P. for Norwich, will probably succeed Mr. Leing in the representation of Wick. A new Secretary of the Treasury is not so easily named. Mr. Frederick Peel is the most spoken of. It is just the place for his industrious and hard-working habits. It is rumored that the Government would be glad to find a successor to Mr. Leing in the ranks of the northern Radicals. In this view Mr. Danlop (Grosvenor) and Mr. J. B. Smith (Stockport) have been named. If the place goes by promotion, the choice will probably fall upon Mr. Thomas George Baring (Palmouth), now Under-Secretary of State for India, one of the most effective of the young Whigs in office.

I am not over-confident of the Liberal success in the coming borough elections. Mr. Ridley would have stood the best chance for his native town of Boston; but he has generously given way to Mr. Tansford, who is now the only Liberal candidate. The Conservative, Mr. Melbourn, is however very strong in money and influence, and will be hard to beat.

There are still two Liberals and one Conservative in the field at Reading; but it is to be hoped that the weakness of the former will not prove in dividing the party, and risking a seat that properly belongs to that side. Let him take Mr. Ridley's example, and profit all the better at a future opportunity.

At Berthoult the contest will be close, in proportion to the malice of the constituency. The Conservative Mr. Hardy is very rich, and has secured the support of Sir Henry Sculthorpe, although the incumbent baronet is uncle to the Liberal candidate, Mr. C. Sculthorpe.

At Houlton, Mr. Moffatt will, as I expected, have a walk over.

The several theatres have pretty well settled down for the winter, and there are very little theatrical anticipations to indulge in. The most extraordinary is that Grisi will return to her *primitive* manner, and take her leave at Her Majesty's Theatre of the scene of her early triumphs. At this house English opera has fairly beaten the Italians, although the favourite operas of "Il Trovatore" and "Don Giovanni" have been produced, with Tiziana, Giugliani, &c. Mr. Macfarlane's *Robin Hood* has been a complete success, the fine music being well seconded by Mr. Gordon's lyrics. Mr. Hart may look to his laurels in his forthcoming opera at Covent Garden house. "Pacheco" has been an improvement upon "Lerlin"; but where some novelty is still anxiously looked for.

A new opera will, we understand, be soon brought out at the Eastern Opera-house, in which the principal soprano is to be supported by Madame Lucina. This opera, designated "The Young Hebrides," is composed by Mr. John Fitcher, of Glasgow, and the libretto written by Mrs. Valentin Roberts.

The London Choral Society's fourth inspection took place on Monday evening last, at a large assembly room in Grosvenor-street, North. The selection of Sacred and Secular Music of the programme was made with taste and a nice discrimination as to variety. The room was well filled, and the performance evidently gave great satisfaction. One feature in the management of this society does credit to the committee who conduct it—that is, a firm determination to make clear and effective collections for their good work. In this regard the Royal Academy of Music has placed the Professor of Music at the disposal of the Royal Academy of Music in the position of tutor to their choir in that department.

RURAL ECONOMICS.

HOW WE ELEVATE OUR LABOURERS.

The condition of labourers in Lancashire, in most of our purely agricultural districts, was, for the first forty years of the present century, a scandal to the nation. Especially was it a scandal to the classes on whom the existence of the evils affecting that condition mainly depended, the owners and occupiers of land. The history of that condition is brief but suggestive. When, in the last ten years of the last century, the prices of all kinds of agricultural produce had risen to most exorbitant rates, the then ordinary wages of rural labour became wholly inadequate to the necessities of the labourer. He could not maintain himself and his family even on the lowest scale upon which agricultural workmen had been maintained. The natural remedy would have been an advance of wages. The committees of agricultural labourers helped to produce—being the commodities also requisite for his own subsistence—had become so enhanced in value, that the rents of the landlords and the profits of the farmers rose to an extent neither landlords nor farmers ever contemplated. Their labourers should have shared in those advantages; and had they been allowed to take their natural course, they would have participated in the benefits gained by their employers—the farmers, and their superiors the landlords. The necessities of the workmen would have led to a general and combined demand for higher wages, and the state of the markets for their employers' produce would have justified that demand, and would have enabled the farmers to comply with it. Then, of course, would have increased the cost at which farmers raised their produce, and would have lessened the surplus to be divided between themselves and their landlords, as profit and rent. From this the landlords instinctively recoiled. What then was done? The immediate form of the question was great distress among the agricultural labourers from the fall of their wages to meet the increased price of provisions, and instead of adopting the natural remedy, a general advance of wages, resort was had to the machinery of the Poor Law. The Berkshire magistrates took the initiative, by ordering relief out of the poor-rates to those agricultural labourers who had large families. This was rapidly followed in other counties; and in a few years throughout England, as in Trent, the consequence was that a considerable part of the wages of the agricultural labourers was paid out of the poor-rates. Unforeseen results followed. Those labourers were best off who had most children, for they had an allowance for each child out of the rates, even when in full employment, and to save the rates the men with large families were employed in preference to the single men or men without families. Of course few men remained unmarried till the age of twenty-one. The spectacle of a boy and girl—man and wife—both under the age of twenty-one, with two or more children, applying for relief from the rates in respect of children was not uncommon. The labourers finding their employment to depend, not on their skill, but on the number of their children, would endeavour to increase the rates, because comparatively careless, indolent, and demoralized. In a word, the whole class of agricultural labourers became paupers. This arose reacted on landed property, and in 1830 the burden of the rates, and the state of the rural classes became almost intolerable. Then we had "Swing" riots and incendiary fires, and a general distaste to the agricultural life, and a general disunion. One consequence of the system was, a universal demolition of cottages, to prevent workmen becoming entitled to relief in the parish. What to do with the "surplus labour" of the agricultural districts remained a question after the New Poor Law, and, in some degree, stayed the plague of pauperism, and down to the repeal of the Corn Laws.

It was just after the investigations into the state of pauperism which preceded the passing of the New Poor Law that landlords and farmers began to be alive to the importance of fostering independence amongst the rural labourer; and by way of doing so, the device of offering prizes for horse services, and for rearing large families without the aid of parish relief became rather a favourite one. At first the absurdity of such a scheme was not perceived; terror at the effects of pauperism occupying exclusively the agricultural mind. Afterwards, when the press began to notice the subject and comment on it, prizes for skill in agricultural works, ploughing, draining, thatching, and the like, were offered; and now so Mr. Dismal tells his Buckinghamshire audience, these prizes are given to agricultural labourers as a public recognition of their private virtues.

The whole thing, however, was a miserable sham; and the labourers having now become in a great degree independent, from the increased demand for their services, the promoters of these "Labourers' Friend Society" are hitting their exploded schemes on to a fair or a child-sale, to avoid the confession of failure.

Thus, in Wiltshire, the "Marlborough District Association, having been already amalgamated with Marlborough Park," with a view of rendering it more of an agricultural society, it was said to be of the greatest advantage that they should receive such recognition as would enable them to carry out their object—"that object being the establishment of a general agricultural society. As a specimen of the mode in which the Marlborough Association proposed to elevate the labourers, it may be mentioned that William Brooks, recommended by Mr. May, received a prize of £2 for forty-nine years' service; and William Ladd, recommended by Mr. Pigott, for forty years' service, was awarded the second prize of 25s. Why, this is simply a mockery.

The chairman of the meeting told the prize labourers that "it must be a pleasure to them to listen to a few words of praise and acknowledgment, and to carry home the society's tablets to show their neighbours, relatives, and friends that their efforts had been appreciated," and named some to the same effect; after which, the report tells us, "the labourers then retired, with many expressions of thanks upon their lips." But what was in their hearts! It is probable—it is possible—that they, or any of their class, felt elevated by the exhibition made of them!

Let us hear what was said of the matter by an observer of such a scene. At another of these societies, in Shropshire, a clergyman, the Rev. Dr. Dowles, suggested "a great improvement in the mode of distributing the rewards to farm labourers and domestic servants." He said to the members—"Under the present arrangement, those whom you deem worthy of so great a distinction are called in and habilitated in the room of the man with little more—nay, with not so much observance, as the prize eaten in your show-yard, and have scarcely time allowed them to pocket their

rewards, and gulp a glass of wine, and which their exit. . . . I think you will agree with me, that this is an occasion when the rich and the poor, the employer and the employed, meet together on something like equality. I would therefore take the liberty of suggesting that when they come in to receive their rewards, the patron of the society should himself be requested to distribute them. . . . I think that the patron might almost venture to tell them that goodness levels all the distinctions of this world, and that the sense of duty and the power of doing right are the greatest gifts God can bestow upon man. He might also express upon them the greatest man in this world is not the person of the society, or the honourable baronet on my right, or the members of Parliament, or any among those he may see about him; but that he is the greatest man who, be his station in life what it may, is most impressed with a sense of duty."

This was too much for squires and squirearchy; so Sir Charles Doughton spoke up and told Dr. Dowles that the way to show proper respect to the working classes "was not by coming to that meeting and making a clap-trap speech, for the purpose of setting the lower orders against the higher." Such is the way in which the very natural and sensible suggestions of a clergyman, who was impressed with the indecency of the treatment the prize-receiving and patronized labourers received at the hands of their patrons are treated. But, does not this scene forcibly suggest that moral qualities and the acts which men do under the promptings of self-regard are not fit objects for petty prizes?

MACFARREN'S "ROBIN HOOD."

THE production of this new opera at Her Majesty's Theatre is an occurrence worthy of more than ordinary notice, for this simple and sufficient reason, that "Robin Hood" is, we have no hesitation in saying, the most important production for the English musical stage since the days of Purcell. Indeed, we doubt whether it is right to make even this qualification; for though our immortal countryman ought ever to hold the highest place among English musicals, yet in his time dramatic music was almost unknown in England; and though his mighty genius served him far in this respect, it is not the least of his glory that he has left the theatre so scarcely entitled, in our day, to the name of opera.

"The Tempest," "King Arthur," "Bianca," and Purcell's other so-called operas, were merely plays with music introduced. None of the *dramatis personæ* sang a note; the music consisting of incidental airs, choruses, and interludes, sung and played by performers who took no part in the action of the piece.

Of the opera, properly so-called, music is an essential element; it is the language in which persons of the drama express their sentiments and feelings. It is as necessary to an opera as blank verse is to a tragedy; but as tragedy has no room for the dignity of verse in scenes where the dialogue is light and cheerful, a similar relaxation has been allowed in opera, the performer, in such scenes, using only ordinary speech, without music. This relaxation is not at all permitted on the Italian stage, where every word of the dialogue is uttered in music. So it is in the French and German serious opera, talking being admitted only in the first and last and aptly enough in this country, in the progress of the stage, musical pieces called *opéra bouffe* came into vogue, in which the actors themselves sang; but still the chief part of the dialogue was simply spoken, the performer every now and then breaking into a song, as is now done in the French *vaudeville*. Such was all our English opera of the eighteenth century, and the beginning of the nineteenth, the work of Arne and his successors, down to Bishop. Since then the foreign models have been more and more adopted, and the language of the stage has been more and more associated with music.

Macfarren's "Robin Hood" is the most complete specimen of English Opera, in its modern shape, that we yet possess. The work of his greatest predecessors were produced in immature states of the art; and he has unquestionably carried away the palm from the most eminent of his contemporaries. Whether his two rivals who are most competent to contend for it, will yet do so successfully, remains to be seen. Meanwhile he holds it by the general voice of the public.

Macfarren has been fortunate, or, judicious, in having for his collaborator, Mr. John Oxenford, whose poem is a *rustic aria* among opera librettos. It is a pretty drama; elegant, interesting, and admirably suited to the requirements of the musician. For materials, Mr. Oxenford has had recourse to the fine old traditional ballads of which Robin Hood is the hero. In the "Walter Scott" of "Franklin," which the *quintessence* is so delightfully introduced. The plot and construction of his piece, however, seem to be original. Mr. Oxenford, like Scott, makes Robin Hood flourish in the reign of the lion-hearted king, Richard the First, who, however, is not introduced as one of the characters. We need not say that the story is a new one, and that the poem is a new one, and that the characters have played a striking part in Mr. Oxenford's drama. As in "Franklin," so, the *quintessence* of Robin Hood appears under the name of Locksley, a "well-to-do" young yeoman, who not only wins the heart of the shrift of Nottingham's daughter, but is acceptable even to her haughty father, who grants his daughter's prize on the condition that the sister shall earn the prize of archery from all competitors. But his hopes are baffled by an unlucky occurrence. The squire (or treasurer) of a neighbouring abbey has fallen into the hands of his lord, who treats him in a characteristic fashion—having him of his money, making him share their feast, and dance for their amusement before they let them go. A natural consequence is that the monks, recognizing Robin Hood at Nottingham fair, disavow him to the sheriff and his daughter as the outlaw chief of the land who robbed him. Robin, who has just gained the archery prize in his mistress's presence, and is in the heyday of triumph and happiness, finds himself all at once "fallen from his high estate," apprehended, by the sheriff's men, and, as a robber, and consigned to prison, where he is condemned to death and left to execution. But by the exertions of his faithful Marian, who, disguised as a boy, brings his hand to his aid, he is rescued for the moment from the fangs of the law. A party of soldiers, brought by his vindictive enemy the squire, overpowers the outlaw band, and his condition is more desperate than ever, when the squire's daughter, who has been by the announcement of her father's death, is granted Robin Hood and his merry men a free pardon, on condition of their entering his service; a somewhat curious *dramatis personæ*, though the piece, on the whole, is cleverly and neatly executed.

Mr. Oxenford's lyrics are sometimes graceful and often spirited. We quote the following drinking song, which Sinae Reeves sings with immense effect on the audience:—

"The grunting, grunting Norman race
I cannot count as life;
I would my staff could have a trace
On or of Norman hide
But there are sadder moments, when
To lose them I am loth;
We cannot always have the moon
We have fought in sparkling sun."

"To reconcile my love and hate,
I've found no way save
Whenever wine is flowing by fate,
I drink, and feeling courage glow
As with a fiercer
When I readier still to thrust the wine,
We have had quaff'd his life."

Mr. Macfarren is already well known, by numerous productions in various branches of the art, not excepting the stage. His opera "Don Quixote" and "King Charles the Second," are works of a high order, and had deserved success, but "The Red Rover" is a step much in advance of both. It evinces genius, matured by experience and study, and especially by the study of the national music of his own country. Macfarren emulates the modern foreign composers, Rossini, Auber, and Meyerbeer, but does not imitate them. He has profited by the study of their works in acquiring their constructive skill, their power of combination, and knowledge of dramatic and orchestral effect; but he never forgets, or allows the audience to forget, that he is an Englishman, and that they are listening to English music. This gives a peculiar charm to the music of his opera, which distinguishes it from that of his contemporaries, who, while their clever, and often brilliant, productions show that their minds and imaginations are in touch with the foreign school of music, betray an entire neglect of the rich stores of our own national melodies.

The management of Her Majesty's Theatre has done justice to this work in the manner of its production. Mr. Sinae Reeves's personation of the gallant outlaw is spirited and manly, and he sings with even more than the power and beauty for which he is renowned. The part of *Morion* is charmingly acted and sung by Madame Lesauvage Sherrington. *Santa's Sheriff* is a magnificent performance, as regards the music, though somewhat deficient in dramatic power; while, on the other hand, Honey acts the comic part of the *Snowplover* capably, while the music is beyond him. The subordinate parts of *Alfred—Jem* and *Alice* are respectably sustained by Mr. Parkinson (a promising young singer) and Madame Lesauvage.

THE SHAKESPEARE IRELAND FORGERIES.

III.—THE FRAUD DELINEATED.

THE volume from which we derive our illustrations contains on the fly-leaf an inscription in Ireland's handwriting, presenting the book to his "friend Mr. Mosieriff, with best regards," and a note at foot, referring to the "Unfortunate" for a full account of the specimens. In a letter which follows, as usual without a date, Ireland says:—"I remit you according to promise some specimens of the Shakespearian fabrications which I hope may meet your wishes and tend to enrich your Theatrical collection." The letter concludes with an invitation to Mosieriff to dine with him on the following Sunday, at four o'clock. Ireland, at that time, lived at Kirk Home, Pitt-street, Prospect-place; and, but Mosieriff should make any mistake about the house, he adds some directions in a postscript how to find it:—"My house is the last on the left-hand side and is apparent from being the largest in the street and has three windows with iron balconies. Like all poets I totally omitted on the other side to say that my daughter is *now on-aria* that you should hear her voice and for that purpose select you will not fail on Sunday." This postscript is a characteristic example of Ireland's cloudy and involved way of writing. He did not mean to imply that it was a falling universal to all poets to omit saying on the other side that their daughters were anxious Mr. Mosieriff should hear them sing; but that is exactly what the passage does imply. Ireland, although he wrote and published many works, never acquired the art of expressing himself clearly or in good taste. He always wrote like a man whose education had been suddenly stopped, and who had afterwards picked up whatever he knew by bits and scraps. His violations of grammar, and sometimes even of orthography, are surprising enough for one whose attention was given so early to the highest literary models. Nor is it the least remarkable of his peculiarities that the only point he appears to have used in punctuation was the full-stop.

Amongst the curiosities in the volume there are tracings of the well-known authentic signatures of Shakespeare, larger than the originals, and of which every accurate reader is able to detect the forgery of Queen Elizabeth and Henning the player. These are followed by facsimiles of the fabrications, of which the following are specimens:—

William Shakespeare

Elizabeth Shakespeare

The next facsimile is another fabricated signature of Shakespeare. It is affixed to an acrostic on the name of Elizabeth, written in an imitation of the handwriting of the period, but palpably betraying in many places its modern origin, especially in the initial letters running down the side:—

Elizabeth Shakespeare

There is also an acrostic on the name of Mary Queen of Scots, to which the annexed signature is attached:

William Shakespeare

In our last we inserted a facsimile of a pen-and-ink drawing inclosed in a letter to Richard Cowley. Here follows a facsimile of the spurious signature attached to the letter:—

William Shakespeare

The writer in *Fraser* refers to an anecdote recorded in the *Gentleman's Magazine*, to the effect that Ireland copied various autographs of Queen Elizabeth and Shakespeare from

Elizabeth and Shakespeare from Chatterton's forgery of the De Burgh Pedigree. It could scarcely have been from that source he adopted his imitation of the Queen's signature, unless Chatterton's (which we have never seen) was a close copy of the original; for the spurious autograph affixed by Ireland to Shakespeare bears a close resemblance to the original.

In some cases the forgeries are wholly unlike the genuine signatures, especially in the instances of Henning the player, and Lord Southampton. The contrasts with which Ireland varied his Shakespeare autographs is remarkable, and was, no doubt, intentional; his object being to exhibit such accidental differences as constantly occur in the same signature, written under different circumstances, by the same hand, and which he preserved throughout certain essential characteristics common to them all.

In Henning's signature there is no pretence of resemblance, the original being singularly clear, small, and plain, while the forgery is extremely intricate, and sprawls over the paper with a tremulous superfluity of decorations. The trivial differences to which we have alluded, pervading a number of signatures marked by a common character, appear to have been completely answered the purpose for which they were apparently intended. The more minute the inspection, the greater was the conviction brought to the mind of credulous investigators, by the discovery of these very natural variations of the same autograph. One illustration will suffice of the arguments that were drawn in favour of the authenticity of the manuscript from these minute diversities. A pamphlet—one of the multitude to which the controversy gave birth,—called "Shakespeare's Manuscripts in the possession of Mr. Ireland examined, &c. by Philalethes: 1796," contains the following passage, upon this feature of what may be called the internal evidence. The reasoning is extremely curious in its application to the truth and perfect that may be carefully laid for speculative critics by skillful fabricators:—

"The Identity of Shakespeare's autograph, in the numerous signatures of his name on these papers, as well as in the papers themselves, manifestly appears. There are no more variations than what might have been supposed to take place from their being written on different papers, in different ink, at different times, in various humours and dispositions of mind, and on various occasions. The errors and omissions that appear are such as might have been expected from a man of a warm temper, impetuous, and prompt genius, which would naturally prevent his comparing with minute attention, and reviewing, and correcting what was thus rapidly produced, with labour and accuracy, let them be such as imposture would have scarcely deemed necessary—may, rather, such as it would most probably have carefully avoided. Therefore, it is not straining the argument, to say, that these very errors and omissions (the identity of the other characteristics maintained) are no inconsiderable proofs of authenticity."

"Philalethes," the author of these sagacious remarks, was Colonel Webb. The spurious signature of Lord Southampton is wholly unlike the authentic autograph, which Ireland had never seen. He tells us that he was led to forge a correspondence between Shakespeare and Lord Southampton, by having heard of the bounty of the latter to the poet; but, on inquiry, could not learn that any signature of his lordship's was in existence. "I accordingly," he adds, "formed his mode of writing, merely from myself, and, the

William Shakespeare

Elizabeth Shakespeare

William Shakespeare

Elizabeth Shakespeare

ingly," he adds, "formed his mode of writing, merely from myself, and, the

letter to disguise it from Shakespeare's I wrote the whole with my left hand; this was done to give more authenticity to the story." Of three signatures of the Earls of Southampton which are preserved in the British Museum, without entering into the question as to which of them is that of Shakespeare's friend, there is not one that bears the slightest resemblance to the signature fabricated by young Ireland.

One of the great difficulties he had to encounter in the first instance was to obtain paper fit for his purpose. Being ignorant of the water-marks of the age of Elizabeth, and well aware of the risk of detection he would have incurred from the use of a modern water-mark, he was extremely careful in the beginning to use only such sheets of paper as had no mark whatever. Having afterwards learned, however, that the "Jug," as he spells it in his "Authentic Account," was the most prominent water-mark of Shakespeare's day, he got sheets wherever he could, bearing that impression upon them. The jug is here reduced in size, but the outline is carefully preserved in the fac-simile, which presents as accurate an image of the original as can be conveyed by a woodcut of a transparent figure. The form is antique, and has something of the character of an ancient tankard. But the fabricator did not limit himself to this single water-mark. He collected other odd ones (probably without much exactitude as to their precise dates), with a view, in all likelihood to confound his critics. Thus Ireland, the father, lets us know that in the paper on which his MS. copy of "King Lear" was written, there were no less than twenty different water-marks.

Special interest attaches to the following signatures. They were the first of the Shakespeare series, begun after Ireland's return from the tour in Warwickshire, and were attached to the spurious deed or lease between Shakespeare and John Hemming, Michael Frasier and his wife. The Frasier signature, like that of Southampton, was written with the left hand.

William Shakespeare
Michael Frasier

The handwriting of the body of the lease was carefully imitated from a law paper of the time of James I., and the forms were adopted from a mortgage-deed which had been actually executed by Shakespeare, and which young Ireland chanced to discover in Steevens's Shakespeare. The fabricated lease was full of errors and redundancies, which nobody seems to have detected until Malone pointed out some of them.

It was curious, however, that the close wording of the lease after the covenants of the mortgage escaped all the investigators, including Malone himself, who had published the original not long before, with a fac-simile of the signature. There were other points that ought to have awakened suspicion; but they passed without discovery. One of them was the ink, which, although it looked old on ordinary paper, presented the appearance upon parchment of common ink diluted with water. Affixed to this lease was what Ireland designates the Quintin Seal, meaning thereby the Quintin Seal, of which the annexed is a fac-simile, on a reduced scale. The Quintin was a post, having a cross-piece turning on a pivot, with a sand-bag at one end and a board at the other. The ancient pastime of the Quintin consisted in riding full tilt at the board with a lance, and getting off in time to escape the whick of the sand-bag.

For the purpose, he tells us, of giving a genuine air to the other fabrications, although we cannot see how it strengthened the case, Ireland forged certain agreements between Condell and Lowine, the players, to which he attached the following fabricated signatures:—

Edmund Condell
& John Lowine

Here we must pause for the present. In our next, and concluding, article, we shall lay before our readers some hitherto unpublished particulars respecting the way in which the Forger was detected at his work, and the personal characters of Montagu Talbot and William Henry Ireland.

INVENTIONS AND DISCOVERIES.

THE DEBUSSCOPE.

THAT electricity is universally diffused is not yet ascertained, but that light it seems quite certain, and the charming inventions connected with it in modern times, have been as extraordinary as those connected with electricity. Photography, in its multiplied ramifications, is as completely one of the wonders of the age as the telegraph. About forty years ago the world was for a time much amused and interested by the kaleidoscope, another invention connected with light, and from its curious combinations many new patterns were actually copied. They were infinitely varied, and beautiful beyond anything that a Raphael could design and draw. But they could not be easily fixed; they could not, therefore, be readily copied, and the instrument that at first excited so much pleasure and so many hopes, soon became merely a toy, but the most elegant toy that art had ever devised. Now the great deficiency of the kaleidoscope has been supplied. An ingenious Frenchman, M. Debus, has constructed a machine, very simple, yet compounded of the angular form of the kaleidoscope reflectors and the slide of the stereoscope. The object, therefore, can be put into what was the bottom of the kaleidoscope, where it is many times reflected; can be held in one position as long as the artist pleases, and moved or withdrawn at his pleasure. But every movement, however small, changes the figure, and, therefore, the variety is quite equal to that of the kaleidoscope, while every change may be readily copied. The Debuscope has, moreover, the advantage that any and every kind of substance or form may be introduced on one of its slides, and be reflected, while the kaleidoscope was almost confined to little pieces of cut glass. The Debuscope then is a much improved kaleidoscope.

Our first illustration shows the form of the instrument, which is not more than 2½ inches high, and altogether is not much bigger than a man's fist. The open space into which the artist looks is lined with reflectors; the slide is put in at the bottom, and the changes which every object undergoes as it is moved in the slightest degree, are quite marvellous.

Our second illustration is a scribble made by the pen, to test the power of the instrument, and it is absolutely devoid of any recognised shape or beauty; our third illustration represents this scribble as seen at one moment in the Debuscope, and the reader cannot fail to admire the elegant and symmetrical figure which results. Every other thing, however

strange or ugly, is, in like manner, by the mere multiplied reflection of its several parts transformed into an object of great beauty. It evokes order out of chaos. This is, for us, the most extraordinary part of the whole. Light, it seems, is full of hidden beauty, which manifests itself when we acquire the art to make it visible. If the Debuscope has no other merit than to make this fact manifest, it would deserve to be described and remembered as a most remarkable and useful invention.

In the drawing-room it will afford endless entertainment. For the arts it will be almost equally serviceable. It will banish for ever the grotesque and ugly patterns that have so long covered our clothing, our furniture, and the walls of our houses. Possessing these many advantages, it can now, even almost before it has become known, be purchased for a few shillings. The agents in London for the enlightened inventor are the Messrs. Elliott, Brothers, opticians, No. 30, Strand; and we do the public, rather than them, a great service by making the merits known of this simple and beautiful instrument. Probably the applications of which it is susceptible are numerous. There is nothing mean that may not be ennobled by being repeatedly reflected; nothing ugly but beauty may be evoked from it; just as there is no noise which by repetition in time does not become harmonious. Harmony is not confined to the spheres; it pervades Nature, and the Debuscope seems to make apparent the music of light.

THE STRATFORD-UPON-AVON RAILWAY.

ALTHOUGH the first railway in the kingdom on which passengers were carried lies within a bowshot of the church where Shakespeare's bones are buried, Stratford-upon-Avon has been one of the latest of our towns to be connected with the great railway lines. For some forty or fifty years the Stratford people have been carried on the tramway to Marston-in-the-Marsh, and still later this tramroad has been used in connection with the Great Western line. Early in the present year the Honeybourne branch was opened, by which Worcester and Malvern people had easy access to "England's Mecca;" but visitors from Warwick, Leamington, Coventry, or Birmingham had eight miles of ordinary road to pass over to reach the pleasant

little town. The road from Warwick commands some glorious views of southern Warwickshire, bounded by the lofty Edy Hill range, and including within the grand bird's-eye view well-known Shakespeare scenes. As no very convenient coach runs, and as few pedestrian pilgrims were enthusiastic enough to walk eight miles over to Shakespeare's shrine, the visitors, although numerous, have been comparatively few.

The line of railway formally opened on Tuesday (9th October), leaves the Llanston station of the Great Western Railway, the first station between Warwick and Birmingham. Hatties is a small little village about a mile and a half from the line, and is chiefly remarkable as having had the pedantic Dr. Parr, the great Greek scholar, as its resident minister for many years. The picturesque little church in which he ministered contains the tablet over his tomb in which his virtues and attainments are recorded. The Stratford line leaves Hatties station and runs in a large curve and at present with a single line of rails, past Claverdon, Bearley, and Wilnecote stations to a point near Flower's famous brewery, on the Birmingham road. The newly-erected station is plain and unadorned, and has the advantage of being within a few minutes' walk of the "hons" of the town. The opposition of local landowners, and the want of interest of many of the inhabitants, who fear, as small townspeople always do at first, that a railway will be the ruin of their place, caused many and serious delays. The very unfavourable weather and the stiff Warwickshire clay to be removed, offered many engineering obstacles which the energy and skill of the contractors (Messrs. Bannan & Gwyther, of Birmingham), have successfully overcome. On Tuesday, then, they invited a large party of the shareholders and friends to join them in the preliminary trip, and great satisfaction was expressed at the admirable manner in which the work had been accomplished, and of the extreme smoothness of the progress of the train. On arriving at Stratford, the visitors were welcomed by the spirited music of the band of the local Volunteers, and soon dispersed themselves among the various objects of interest in the quiet and clean old town.

The birthplace of Shakespeare has unhappily lost the very liberal bequest of Mr. John Shakespeare, in the intricacies of old legal forms; but the active and intelligent committee have succeeded in restoring the old house to the condition in which it stood when John Shakespeare lived here, and his great son William was born within its walls. The well-known aspect of the place is gone, and the old house has been carefully restored; the former windows inserted in the roof, the penthouse porch replaced at the door, the windows placed with diamond lattice, and the venerable building isolated, so as to be beyond all chances of fire. Some rustic fence-work encloses the space to be converted into a garden, in which several of the gentry of the town will place the memorials they possess; and Mr. W. O. Hunt will contribute some of the very few fragments of New Place, where Shakespeare lived in his dignified retirement, and within whose walls he died. Instead of the usual donations, the committee have now proposed a uniform charge for admission, the money being required for the payment of the custodian, and the increase of the restoration fund.

The New Place, where Shakespeare lived in his later years, and died in 1616, was pulled down by Farnes Stretton, who had to leave Stratford by night, and just existing in the dilapidated and the dilapidated, now occupied by a surgeon's house. On part of its garden the Stratford Theatre very appropriately stands. Near it is the old church of the Guild of the Holy Cross, whose curious wall-pictures have happily been preserved in Mr. Fisher's illustrations; and opposite is the Falcon Tavern, with a room wainscoted with some of the old wood of New Place. In the hall of the Shakespeare Inn is an old clock, which seems to have been in the house when Shakespeare died; and in the lower room of the Grammar School is a much-worn old desk, at which tradition tells the schoolboy Shakespeare sat. In a private garret not far distant, is the font which was in the church when the poet was baptised, although thrown into the church-house, and sadly misused since.

The great attraction of Stratford, however, is the fine old collegiate church, with its lofty tower and handsome spire rising over the avenue of limes which lead to the chancel door. Nothing need be said in description of this grand old church, and nothing need be added concerning that half-gire of the bard on the north chancel wall. Chantry and other sculptors say that it has been evidently been worked from a post-mortem cast, and if so, it gives us the only genuine portrait of the poet now remaining. The quaint doggerel verse on the poet's grave, the inscription over his wife's and daughter's, and her husband, need no description; nor need we pause to tell much about the registers, in which the poet's baptism and death are recorded. It is enough for us to-day to remember that we have stood to-day in the last resting-place of one of England's noblest sons, and visited the pleasant scenes in which the "gentle Shakespeare" lived, and loved, and died.

OLD DRURY.

Of the two great theatres, or Temples of the Drama, as they used to be proudly called, that still exist in London, a few years ago, only one remains. Covent Garden is a creation of to-day—a false without traditions. The building is not associated by a solitary link with the history of the stage. The site is sacred; but, like a thousand other sites, a piece of architecture has been dropped upon it that has blotted it out for ever. The architecture itself is very grand; but it is not a playhouse in the old and loving sense of the term. It is a pleasure-house, open to all sorts of entertainments, and influenced by none. The last play-house that stood on the spot was burned down under the auspices of a Wilmot. Even conjuring could not save it. And only one of the great houses remains. This circumstance invests the opening of Old Drury with a peculiarly interesting special interest.

Old Drury! One thinks at once of the boards where Garrick tried, and nobody lives to tread. If we wanted a forcible illustration of the fallen condition which the stage has been reduced by the inevitable operation of an open trade in plays and play-houses, we should point to the spectacle presented by this house at the present moment. It has everything in its favour that prestige, ample means, resources, and a clear head. It is evident that it can command whatever talent is to be had in town or country; and it has a complete sweep of the unoccupied domain of legitimacy. But out of all these advantages, the utmost that can be accomplished is the presentation of

four small lively pieces, with which the public are already satiated, and which are calculated to flourish, not in this vast area, but in such snug domestic houses as the Strand or the Olympic, where the slenderest materials are productive of the most effective results. We have nothing to say against Mrs. Stirling's capital acting in "The Tragical Queens"; and we welcome Mr. Lambert back to London, as a performer who understands his business. The eccentric vivacity of Mr. Charles Matthews in "Married for Money," if not quite so successful as it used to be, yet retains, we are happy to testify, much of its youthful raciness; and even the extravagance of "His Excellency" has merits in the way of absurdity which we are ready to acknowledge. Our objection is not to these pieces, *per se*, but to their transplantation from the social latitudes where they were reared, into a soil where they perish as they struggle out into the raw atmosphere.

When the London theatres had their specialities marked out for them, audiences knew what to look for, and managers carefully cultivated the particular modes or forms of drama that suited their meridian. Now, it is the chapter of accidents that decides what is to come next at any house. Instead of being kept together with a view to the attainment of completeness in a settled line of performances, companies are now subjected to perpetual changes and revolutions. No company is perfect in itself for any single kind of drama. Theatres are always undergoing metamorphoses. New faces are always appearing and disappearing, and old faces are fitting to and for; so that, with a few exceptions, we seldom know where to fix them. The plays follow the fortunes of the players. Opera is succeeded by a course of tragedy, which, in turn, is displaced by a troupe of acrobats, or African serenaders. The house knows itself no more. The giddy pantomime does not exhibit more unexpected transformations. The Princess's vintages between Miss Louisa Keckley and the Zouaves; Mr. Anderson is seriously talked of at the Lyceum; and Haymarket is revolving presents after Misses James and Misses Selwidge and Mr. Charles Matthews; Mr. Webster, embarrassed by his success at the Adelphi, transports his new play and his buff-comedian to Drury Lane; and Drury Lane is ready to absorb, as occasion serves, all the wandering rays it can attract into its orbit.

When the system is so injurious to the interests of the stage, professionally considered, as of the drama in a literary point of view. There is no school where acting can be acquired as an art. The actor is denied the means of rising into eminence by regularly-sustained efforts. He has no opportunity of making a reputation by the continuous development of his powers. The versatility of his career is fatal to the progress of his art. He is not in his position; for, thus shifted from one stage to another, or whizzed through a multitude of motley and dissimilar parts, he is constantly realizing the fable of Penelope and her web.

The management of Drury Lane claims the merit of doing something towards the restoration of the ancient glory of the house, by the list of engagements it has made for the coming season. We will not dispute the claim, for what it is worth. When Mr. Webster shall have exhausted the anticipated run of Mr. Watts Phillips's new drama, he will be succeeded by Mr. Charles Keen, who will, in turn, be followed by Miss Louisa Keckley. Such are the pledges of a rivalry, to which we should look forward with more confidence if it rested upon a somewhat wider basis. Mr. Charles Keen is not Shakespeare. Mr. Gustavus Brooke cannot embody a whole play. Where is the able company by whom these prominent actors are to be supported? At present it is evident that they are invited, not to witness the performance of "Hamlet," but to see Mr. Keen. Let us suggest, also, that it is simply hopeless to expect that companies hurriedly collected from all points of the compass, and never having had any training together, can present the highest class of plays as they ought to be presented on the boards of a national theatre.

We are far from entering the measure of this state of things upon Mr. Smith. He is, doubtless, doing the best he can, according to his view of what is best to be done. He was not born to reform the stage, and he has not taken to it with any such intention. If he be an autocrat over the various realms and races he rules, he has the excuse, like other autocrats, of being to some extent controlled by the system he administers.

NECROLOGY OF EMINENT PERSONS.

LIEUTENANT-GENERAL SIR HENRY GEORGE WAKELYN SMITH, BART., G.C.B.

On the 12th inst., at his residence in Eaton-place West, from disease of the heart, Lieut.-General Sir Henry George Wakelyn Smith, Bart., G.C.B., in the 74th year of his age. This veteran officer, more popularly known as Sir Henry Smith, one of the most gallant soldiers of his age, or of any period, was the son of Mr. John Smith, a surgeon at Whitehaven, in Cambridgeshire, and was born on that town June 29th, 1787. He entered the army as second lieutenant in the 7th Light Infantry, and subsequently in the Rifle Brigade, May 28th, 1805, and in less than two years was actively engaged at the siege, storming, and capture of Monte Video. He was present at the Battle of Albuera, and subsequently in the assault on Buenos Ayres, under Brigadier-General Crauford. After serving at the bombardment and capture of Copenhagen, he embarked for the Peninsula, and remained with the first division of the army, under Sir John Moore, until the battle of Corunna, when he embarked with the British troops in January, 1809. Returning to the Peninsula the same year, he distinguished himself in nearly all the great battles and sieges of those eventful campaigns, from the attack on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." At the battle of Albuera, he was severely wounded, and subsequently in the assault on the Coa, when he was seriously wounded—a casualty which prevented his sharing the glories and dangers of Talavera—to the battle of Toulouse. "It would be superfluous," justly remarks a contemporary, "to do more than recite the other engagements in which this eminent English soldier distinguished himself." noctity in town and country is, at this moment, "deeply suffering from the want of organized female agency in works of charity and religion." The difficulty to be encountered is how to establish "an organized agency," without binding by religious vows, as in the Roman Catholic Church, those who are "so organized." This difficulty the reviewer admits, and endeavours to show how it may be avoided or evaded, if it cannot be practically overcome. "Public School Education" is, for the most part, a review on three school novels,—"Eric," "Hail the Echoed," and "Geoffrey Hamlyn,"—and the reviewer maintains, and, we think, proves his case, that "the picture of school life which they present, is neither faithful nor edifying." The title of "Wills and Will-Making—Ancient and Modern," considering the well-established character of the Quarterly for its classical knowledge, will lead to disappointment; for there is not one word in it upon a topic which occupies so large a space in the writings of the ancient scribes—the will-making of old, rich, and childless individuals. The working of Christianity is developed in the testamentary depositions of the dying, even though it has not, at all times, been found of sufficient strength to alter many of the customs that prevailed in times of paganism. Even the charitable dole which relieved the wants of the poor can be traced back in the custom to which Persian alludes when he talks of the angry host, disappointed in the expectation of a rich legacy, refusing to taste of the funeral supper—

"Soil exanim fœvitis heres
Nagligot (ratia, quod rem curaveris."

The article on "Competitive Examinations" is strongly opposed to the new system of testing the fitness of persons for employment in the public service. The heads of great commercial establishments, it is observed, do not resort to it; and the directors of companies have "found the system of simple nomination perfectly efficient." There are, in addition to these, an article upon the "Use of Iron in Ships of War," two interesting notices on the "Adam Bede" novel school of writers; and Mr. Foster's book respecting "The Arrest of the Five Members."

THE GREAT OVERTHROW.

I.

"There's not a Builder in the World
"Can build so well as I,—
"So high and strong; so broad and long;
"So shapely and so high;
"With domes, and minarets, and towers,
"Defiant of the sky!"

II.

The giant spoke; and Earth and men
Looked on with laud breath;—
A giant, manifold as Life,
And terrible as Death.
He grasped the mountains in his arms,
And strewn them on the plain;
He scooped new channels for the flood;
He dyked the raging main;
He dug into the pits of hell,
And cried, "I reign! I reign!"

III.

Deep 'mid the ribs of Earth he laid
His firm foundations all;
And fire, and storm, and lightning-proof,
He raised each lofty wall.
Granite were tower and battlement,
And marble, shaft and spire;
With crystal domes above them all,
Red in the morning's fire;
Shining and shimmering, up to heaven,
Higher, and ever higher!

IV.

"Come hither! hither!" the giant said,
"Ye priests and kings abide;
"Fisher, ye peoples of the Earth,
"From every realm and clime!
"And see how deftly I can weave
"Iron and stone and lime.
"Come hither! and as ye pass, confess,
"Low bending, every one,
"There never was Builder such as I,
"Since Time his course began.—
"Never a Building like to this,
"Under the pleasant van."

V.

Thus spake the Giant, superb and strong.
The people surged and roared,—
"He is the Master; he is the King,
"Acknowledged and adored;
"His buildings reach from Earth to Heaven,—
"He is the God and Lord!"

VI.

Forth from the crowd a champion stepped—
A little child seemed he;
His outstretched hand could barely reach
The bend of the giant's knee;
But his look was like the light of Heaven,
When it streams on the stormy sea.

VII.

And he said, "O, hoaster, and profane!
"Thy true thine hands are skilled,
"And great the towers and palaces,
"And temples thou canst build!
"But I can cast them to the earth;
"I can topple them down,
"By wave of my hand, by word of my mouth,
"By darkness of my frown,
"Turret and tower, and battlement,
"Down to the deep Earth,—down!"

VIII.

He raised a bugle to his lips,
And blew, nor loud nor shrill,
But softly as the breeze of noon,
That waves on the grassy hill—
Softly and low as Pity's voice,
That sighs to grief "Be still!"
Or a bribe when she kneels at the altar foot,
And says to the priest, "I will."

IX.

Gently and slowly—soft and low;—
But all the people heard;—
"Twas a light in their souls,—a thought in their hearts,—
A light,—a thought,—a word—
And they listened and listened, and listened on,—
But never spake or stirred.

X.

They listened and listened, and listened on,
Till the notes so soft and low,
Rose ever higher, and higher yet,
As a wave when the wild winds blow;
And rolled,—and rolling,—gathered strength,
Like an avalanche of snow.

XI.

They echoed in the people's heart;
They smote on the giant's ear;
The Earth was troubled where he stood;
And his lips grew pale with fear;
For he heard a rumbling underground,
And saw his topmost towers
Shake like the leaves of the clustering trees,
When the cold wind blows showers,
And the conies' fœvets feel the storm
That gathers in the towers.

XII.

Was it of marble and porphyry,
With all its rare device;
Was it of iron and stone and gold?
Or was it glittering ice?
The turrets seemed to melt in the sun;
The pinnacles fell in huff;
And the solid walls rocked to and fro,
Like ships in a stormy gale.

XIII.

And down! down! down on the Earth,
The stately structure lay;
And the Child upon the ruins stood,
An Angel, bright as day;
And cried with voice that shook the spheres,—
"Thus fall, and pass away,
"Builder and building—far and lie!—
"Time shall restore them never!
"They were but shadows in the stream;
"They were but fancies in a dream!—
"But I endure for ever!"

C. M.

ERRATA OF THE PRESS.—We have received an angry letter from our friend the "GODLY PHILOSOPHER," complaining of some errors of the printer which have crept into his letters. Among other grievances, he mentions that he wrote of the British peasant, as being "a poor, tumble, unostentatious, hardworking, good fellow;" but that the printers made him say that the peasant "was a poor, tumble, ostentatious good fellow;" a manifest contradiction. He also complains that in his last article upon "Values," such a phrase should occur as "canst you," when he wrote "canst thou." But Mr. Wagstaffe, if he writes much more for the press, as we sincerely trust he will, must not take such little matters as these to heart; but trust to the good sense of his readers to be able to lay errors of this kind at the door of the printer, and not of the author. Thomas Moore complained that when he wrote a song about "full-blown roses," the printer perversely made it "full-blown posies." A novelist of our acquaintance wrote of his hero and heroine—that they were at a good old age "bleeded with the dust"—a phrase which the wise compositor turned into "blinded with the dust." The "honour of your visit," as written, has become the "horror of your visit" when printed; and the "rapid actor" of the critic has been known to figure as "a vagrant actor" in the columns of the morning journal for which he wrote. Mr. Wagstaffe is not a simple sufferer; and, as a philosopher, we hope that he will learn to bear such inflections hereafter with proper equanimity.

THE LONDON REVIEW

AND WEEKLY JOURNAL

Of Politics, Literature, Art, & Society.

CONDUCTED BY CHARLES MACKAY.

No. 17.]

SATURDAY, OCTOBER 27, 1860.

[PRICE 3d.]

THE MEETING AT WARSAW.

THE representatives and descendants of the sovereigns who despoiled and divided Poland, have met in the ancient capital of that unfortunate nation, to take counsel with each other on the present aspect of political affairs. The world is not likely to know, in words, the result of their deliberations. Deeds will show it in due time. What their objects are there needs little penetration to discover. To stem, if possible, the advancing tide of revolution; to prevent the disintegration of Austria and the independence of Italy; and last, and most important of all, to perform for Turkey the same funeral office that their forefathers performed for Poland;—these are the ideas that, in all probability, filled the minds of the potentates who met at Warsaw on Sunday last. Time and circumstance will twist these purposes into shapes that may not perhaps be exactly to the mind of these great personages who entertain them. Their hopes, fears, and designs—avowed or concealed—are alike straws on the stormy sea of European politics. They mark the perturbation which they are unable to control. The friends of freedom have this consolation; they know that a mightier power than is wielded by these men—mighty as they may think themselves—creates the rushing, and will prescribe the course, of the waters.

The gradual agglomeration of the long-separated elements of the Italian nation into one consistent and coherent whole, rendered a revolution imminent in Hungary. The Emperor of Austria seems at length to have opened his eyes and his understanding to the fact. Having relied upon force to check the progress of ideas, he has at the last moment discovered force to be unavailing; and with the wisdom of desperation has, for the third time, promulgated a constitution for the whole empire. In this document the Hungarians have received more favour than the Czechs, Germans, or any other of his subjects. Whether the concession will not be considered both too small and too late, will depend less upon the temper of the Hungarians, than upon the terms of the compact into which the three sovereigns may have entered at Warsaw. If Russia has bound herself to aid Austria a second time in preserving the unwilling allegiance of Hungary against the assaults of Kosuth or any other patriot that may arise, the Hungarians will do well to profit, as much as they can, by the large freedom so unexpectedly placed within their grasp.

That Francis Joseph should go to Buda to be crowned King of Hungary, like Maria Theresa before him—that he should renounce the imposition of the German language upon the Hungarian people—that he should forego the power of the purse, and hand over the management of affairs to a freely-elected Parliament—these are indeed triumphs for the long-suffering Hungarians. A successful civil war could achieve little more for them, unless it were the deposition of their monarch. And although it is proverbially easy for foreigners to preach patience to a suffering people, and forgiveness of injuries to men who have suffered both indignity and wrong, the free nations of Europe, as well as those which aspire to freedom, are already of opinion that Hungary might calmly accept what is offered, and take such securities as she can get for its due fulfilment. Though the Emperor in the course of his short reign has granted, by a stroke of his pen, and annulled by the same facile agency, no less than two liberal constitutions, it should be remembered that he and his empire have never been in such imminent peril as they are now. The Hun-

garians, by showing themselves as prudent as they were brave, may wrest from the fears of their king what they might never win from his justice, and found their nascent liberties on a broad and permanent basis. In a stand-up fight, all the world looking on and no one interfering, they might defeat the Austrians, and establish themselves as an independent nation; but if Russia, as on a former unhappy occasion, should throw the sword into the struggle against them, there might be an end of their hopes for half a century. And that such an alliance has been formed at Warsaw is so probable that Hungary will do well to think of the consequences ere she raise the old cry of "Too late," and reject the proffered instalment.

But whatever may happen with regard to the Austrian Empire in its relation to Hungary, the people of England have reason to rejoice that neither Great Britain nor France was represented at the Warsaw meeting. We wish, however, the public had equal reason to be satisfied that the British Government has had no complicity with any of the projects discussed by the three sovereigns. There is an ugly suspicion afloat, to which a recent letter of Lord John Russell, the well-known German sympathies of a royal personage supposed to be non-political, and the matrimonial connection lately formed between the Courts of London and Berlin, have given but too much consistency, that in some way or other Great Britain is to be dragged into the new "Holy" or "Unholy" Alliance. If the public opinion of this country be unanimous on any one subject, it is against such an entanglement as this, in any shape or degree. Nearly one half of our taxation at the present day is due to the error in this respect, committed by George III. and his ministers. The men of 1860 have learned wisdom from the sufferings of their fathers, as well as from the burthens imposed upon themselves, and are so strong in their determination not to repeat the ancient blunder, as to defy every possible ministry—Liberal or Conservative—Whig or Tory—to link the fortunes of this nation to any such projects. Public opinion has declared that the thing shall not be. Great Britain will not be lugged into any war in support of continental despotism. It will not stir a finger to aid Austria in retaining Venetia, as Lord John Russell's unlucky letter would lead the world to suppose. It will have nothing to do with the Northern Powers in their schemes of aggrandisement, unless to defend British rights should they be attacked. And neither friendship for Prussia, nor the intermarriages of the royal family of England with the scions of German royalty, will force or enjoin this country into so unnatural a course of policy.

If Prussia desire the alliance of England amid the European convulsions that are approaching, let her place herself at the head of the German liberals, and she will be supported by British sympathy and good-will, if by nothing else. And how powerful these are the history of Italy for the last six months is more than sufficient to prove. But in no case will Great Britain enter into the Northern confederacy. Any statesman who should attempt to implicate the nation in it, would but seal his own doom, and that of his party, if it did not immediately repudiate him.

We in this journal have never been the flatterers of the Emperor of the French. In his domestic policy we have deplored that he could not extend the liberties of the confiding people by whose suffrages he reigns; and we have condemned, on more than one occasion, the tendency of his foreign policy to unsettle the established landmarks of Europe. But we have never concealed our belief that the Anglo-French alliance—if the Emperor

would allow it to continue upon an honourable basis—was the best guarantee for the peace and prosperity of Europe. Strengthened as it would be by that of the new kingdom of Italy, it would be so powerful for every good, and so impotent for every evil purpose, as virtually to impose the law of non-intervention as the guiding principle of European politics. If there is to be a "Holy Alliance for the subjugation,"—there may be a *Holier Alliance* for the liberation of Europe.

The true place of Great Britain, if she be fettered by an alliance at all, is with the liberators. And the Northern Powers who wish to revive the alliance of 1815 will find themselves overmatched should Great Britain, France, and Italy unite to oppose them, aided, as they will be, by the enlightened public sentiment and aspirations for freedom of all the subjects of their empires.

Let our ministry look well to its acts during the next three months. Lord John Russell has awakened a suspicion that ought immediately to be allayed. It is not Court influence but public opinion and the House of Commons that must settle the foreign policy of Great Britain at a time like this. There is danger ahead; and if Great Britain be not found on the right side, that danger may be found not only abroad, but at home. If Lord John Russell be not in a position to explain, the country will expect Lord Palmerston to speak out in such a manner that there may be no further mistake.

THE NEW NAVAL POWER.

WE have long been, as a nation, in the position of the *fenice incomprise*, whose sorrows our lively neighbours delight in laughing at. We are a puzzle to the rest of Europe; but they, who allow themselves to be lulled by no enigmas, resolve all our actions into concentrated selfishness. The reason of this is, for us at least, self-evident. The policy of all other countries is governed by fixed principles, of which self-interest is, as it ought to be, not the least ingredient. They are, in the Greek sense at least, tyrannies; and their masters, though they may speak of ideas, do not allow them to influence their actions. Our Government is, in the same sense, a republic, swayed by popular feeling, to which the ministers who form the executive must always yield, whatever may be their private prejudices or belief. In our prosaic mood we are a quiet, practical people, with a keen eye to the main chance; but we sometimes indulge in flights of romantic sentiment; and when we do so, no ministry can resist the impulse. The liberation of Greece from the Turkish yoke, the emancipation of the Roman Catholics, the abolition of slavery, are instances of the constraint laid upon unwilling ministers by popular opinion. In rendering justice to the Roman Catholics, we took no account of the inconveniences which the change in the Irish element of the Parliament was sure to occasion. In freeing the slaves in our colonies, we neither grudged our money nor the sufferings inevitably inflicted upon the owners of property. Such acts were incomprehensible to our neighbours, or intelligible only on the supposition that there was an ulterior end in view, and that a selfish one. Albeit fear was the only solution they could find for the emancipation; the abolition of slavery was prompted by the wish to ruin their own petty colonial interests. We are now offering them, in our ardent sympathy for Garibaldi and Sardinia, a fresh problem. Our political romanticism renders the name of Garibaldi at this moment the most popular in England. The divine voice of the people pronounces, regardless of all written laws; and even among our gravest statesmen, there are few Englishmen who do not wish well to the filibuster of Nice. Our humanity refuses to be shackled by any antiquated dictum of Puffendorf or Vattel; and we look on, not only with calm unconcern, but with absolute applause, while Victor Emmanuel violates every article of the law of nations. England and Fortune favour the brave. In the fervour of our hero-worship, the veneration for established rights, which is the characteristic of our calmer moods, is cast to the winds. If Washington could return to life, he would receive the freedom of every corporation in Great Britain, and honorary degrees from both Universities. But it is not mere valour that we honour, for no pitying tear has fallen on the grave of Walker; nor do we worship success, for the late king of Naples was, at least, as heartily execrated here as in his own dominions; yet he was the only Italian sovereign who in '48 was successful in keeping his throne. We must see, or at least fancy that we see, patriotism and substantial right on the side of our hero. Then we cry, "let right be done, though heaven itself should fall," and we heartily wish him well, without care for the possible results as affecting ourselves. We are too strong to indulge in selfish fears. The present crisis in Italy, and the warm sympathies which it excites in England, are the best illustration of what we say.

It is self-evident that when once Italy is united under one government, its sea-board, as extensive as that of England, fits it peculiarly to become once more the seat of a naval power. It would be wrong to argue that the Italians are not sailors; they have been, and may become again, a great naval power. Genoa still cherishes the memory of Columbus and of Doria; the Queen of the Adriatic mourns over her empty arsenals, with the firm resolve to fill them

again so soon as she shall have shaken off her Austrian fetters. Naples is not behind the other cities of the Peninsula in her capabilities as the station of a fleet; and Sicily presents many admirable harbours. We may be sure that United Italy will not be wanting to its mediæval traditions, and that the Mediterranean will soon be dotted with vessels bearing the new tricolour. We sit by and applaud the creation of a nationality which will soon dispute with us the numerical superiority on the high road to our greatest possessions. We are not blind to the possibility that this fleet, unless Italy be grandly ungrateful, will be under the orders of France, so that the liberation of Italy may become synonymous with the conversion of the Mediterranean into the long-dreamt-of French lake. We do not shut our eyes to the danger which may seem to menace us; but our love of liberty for others, as well as for ourselves, causes us to disregard it. In the face of such probabilities old-fashioned politicians might be tempted to despair of our future. Already they think us, who applaud the scattering to the winds of the dry maxims of the jurists, demented, and they prophesy our fall. Let them comfort themselves with the assurance that right is right; and that neither nations nor individuals can suffer wrong from doing it!

A PROJECT ON BEHALF OF THE LITERARY CLASS.

THE Houses of Lords and Commons order to be published every year, at the expense of the nation, a vast quantity of ponderous volumes, known, from their blue covers, as *BLUE BOOKS*. It would be too much to say that all these books are useless or unnecessary; but it would be a gross exaggeration, if not a perversion of the truth, to say that so many as one-quarter of them are of any political, social, or literary value whatsoever. When a new member of Parliament is elected, he is certain to receive, within a few days, a printed circular, from one or other of the dealers in waste paper, offering him the highest current price for his blue-books, and other parliamentary lumber. It is no secret that cart-loads of these volumes, unread, uncut, uncared for, are no sooner received by our legislators than they find their way to the stores of these speculative dealers; whence they emerge in due season, and at an enhanced price, to the shops of butchers, cheesemongers, tripe-sellers, tallow-chandlers, and trunk-makers. They are so cumbersome, as well as uninteresting, that the members of Parliament who are not guilty of the meanness of selling them are only too glad to give them away to the public institutions and libraries of their respective boroughs, though, if these, as is notorious, are not always so ready to receive the gifts as their members are to bestow them. And these books, upon the average, cost the nation about £250,000 per annum. Last year they cost £333,000. And had as this view of the case may be, it is, unfortunately, not the worst of it. If the books were simply useless, and the nation were rich enough to afford the luxury of an annual quarter or third of a million to keep a few paper mills going, and the parliamentary printers at full work, it would become a question for the custodians of the national purse, to consider whether the money might not be better bestowed in some other direction, and for the Chancellor of the Exchequer to decide whether a reduction of taxation, to the amount involved, might not be more just toward the people. But unluckily these books, and more especially those portions of them which relate to foreign affairs, have not the negative merit of being useless, but the positive demerit and vice of being misleading and untrustworthy, if not absolutely false.

But if, for diplomatic reasons, the falsehood cannot be totally obliterated from the despatches of ministers to ambassadors, or of ambassadors to ministers—for who out of that charmed circle can deal with the *suppression* *veri*?—something might be done to prevent the publication of the vast mass of intillity which yearly engulfs the Parliamentary printers. If a plan could be devised by which none but useful and readable blue-books should be given to the public,—in carrying out the plan at least half of the annual quarter of a million now wasted upon rubbish should be saved to the nation,—and if, at the same time, a benefit should be conferred upon men who, according to the high literary and political authority of Lord Bacon, are the chief glory of a nation (though, under present arrangement, only glorious when dead),—we think the Government and the public ought to give it a respectful hearing. And such a plan we beg to sketch for the future consideration of Parliament and the Chancellor of the Exchequer.

An English author in our days, unless he happen to hit the public fancy in novels and romances, or in some other mode that may pander to a fashionable taste, which may be good, but which is just as likely to be depraved or silly, is seldom a prosperous person. He manages to live from hand to mouth, and, if he do not die in harness, and reach that period of life when his overwrought brain is unable to work any more, the Government is shamed into giving him a niggardly pension, to avoid the national disgrace of allowing him to die of starvation, or betake himself to the workhouse, or to a street-crozier, to sweep the road for his intellectual inferiors, for the sake of the chance halfpence that may be dropped into his hat. If the literary man happen to be a barrister of six years' standing, and a steady political

partisan at the same time, there are thousands of good things which the Government can offer for his acceptance. All sorts of commissions, county judgeships, and recorderships are his to ask for and obtain. And if the worst came to the worst, he can accept £800 or a £1,000 a year as a stipendiary police-magistrate in the metropolis. But for the author proper there are no such chances. He must write for the newspapers or for the booksellers; and if he be either too bad or too good for those, he may starve, or go to the diggings, or take himself out of this world altogether, unless, as said before, he is very old, very eminent, and very poor, when a mean pension, less than that often given to a suppliant and better, is graciously bestowed upon him by the Prime Minister of the day.

Our plan is that a dozen or twenty of such men, in the full maturity of their intellect, instead of being pensioned when they are worn out, should be employed, on behalf of the State, in editing the parliamentary documents—in reporting to the House of Commons what returns made by its order are too trifling as well as too voluminous to be worth printing; what, in their opinion, should be condensed and epitomized; what should be kept in manuscript, and what should be printed in *extenso*, and issued to the House and the country for the public guidance and instruction. At salaries ranging from £500 to £1,000 per annum, the State might thus build twenty barons of refuge for competent literary men of good character, whose labours, carried on under the direction and ultimate veto of the House of Commons, might be the means of saving £100,000 or £150,000 per annum. At present the connection of British literature with the State is simply degrading to both parties. The Licensor of Plays and the Poet Laureate are but servants in the Royal household, paid as the goldstick and other servants are, because they are supposed to minister in some way or other to the Royal dignity. All other connection is eulogemary. Twelve hundred pounds each year is granted in pensions to the unfortunate devotees of art, science, and literature; and at least one half of that votive divested from its purpose in pensions to wives, daughters, and sisters of judges, admirals, generals, and other persons dear to the courtly circles, who have died without making proper provision for their families;—such is the connection of Literature with the government of the greatest, wealthiest, and most civilized nation of the globe.

Why should not Literature as well as Law have a chance of State employment in our country? There are prizes in all professions but in that of letters. It is true that if the man of letters amuses the young ladies, and makes the people laugh or shudder over his novels and romances, he may gain prizes enough. In this case the author is but a tradesman, and accommodates his wares to the fashion of the market. Were there no other authority than this,—were there no genius too lofty and too refined for the immediate comprehension of the general reader and the devourer of novels,—were there no literary intellect in advance of the age, and of its ignorance or prejudice,—our literary condition would be poor indeed; our intellectual star would have culminated, and we should have to yield the first rank to nations more civilized than ourselves.

We have yet one more plea to urge in behalf of the project thus broadly sketched. The Government of this country is a newspaper proprietor. It possesses the *London Gazette*, an official journal, in which it is imperative upon the public, in many legal and commercial cases, to advertise. Out of this monopoly the Government derives a revenue of £15,000 per annum, after deduction of all expenses,—a sum sufficient to provide for the salaries of the Prime Minister, the Foreign Minister, and the Chancellor of the Exchequer. Literature might well put in a claim for work and pay out of a revenue like this, even did a large economy created by the judicious editing and publication of the parliamentary documents, in the manner proposed, not allow sufficient margin for the purpose. Mr. Disraeli, Mr. Gladstone, Sir George Lewis, Sir Balcer Lytton, Lord John Russell,—all literary men and ministers, past or present,—might well consider whether the scheme might not be one of public advantage and economy, as well as of literary recognition and reward. To the appreciative judgment of such men as these, and to that of all the friends of literature in and out of Parliament, we recommend it. If it be well that genius like a good soldier, should die for its country, it may be equally well that genius should live for it. And after all a living soldier is better than a dead one, whether he be an author or a grenadier. The grenadier's work may die with him,—that of the author may last as long as the language. It is one of the glories of Oliver Cromwell that he knew how to employ Milton. It is one of the disgraces of Charles II. that he had neither sense nor magnanimity enough to reward Milton from starvation.

AN OLD FOLLY IN A NEW SHAPE.

NOTHING new and good, from the time of the Ephians, was ever offered to society but it was met by envious opposition. Not many years before gas was introduced, turnpike-roads were vehemently objected to by the market-gardeners in the vicinity of the metropolis. They would give distant places access to London and spoil their market. When gas was first suggested, almost everybody

spoke ill of it. The streets would be broken up in a vain endeavour to carry it miles, and it would never be safe yards. It would be flickering, uncertain, and would never be half as safe and useful as the old street-lamps. Omnibuses also, when they first came into vogue, were continually described as nuisances. Daily did a certain journal, nicknamed *My Grandmother*, scream against the *laines*. Cabs, too, Hanson and others, were continually vilified; and numerous persons would rather walk, or employ the old hackney-coaches, than get into them. Railways even, as Mr. Alderman Salomons reminded the Marylebone Vestry Board, were decreed as likely to ruin the country. Town councils, vestry boards, and country gentlemen, fiercely resisted those who would make them. It is therefore neither new nor strange that the holders and occupiers of property intermediate between St. John's Wood and Oxford-street, should object to tramways connecting these two, in time, distant localities. Men of business complain that, to go from one end of London to another by the ordinary conveyances, multiplied and convenient as they are, requires as much time as to go from London to Slough or Brighton. To increase and hasten the means of conveyance within the metropolis is therefore most desirable; and it might be expected that every public body, keeping in view the public interest, would do all in its power for this purpose.

In the first instance the Marylebone Vestry showed itself sensible of this duty, seemed disposed readily to accept Mr. Train's handsome offer to lay a tramway, and provide carriages for it, from Oxford-street to St. John's Wood, at his own expense, and to repair all the damage he might do if he did not succeed. He asked only for leave to try the experiment; and he offered to deposit a sum of money which would be an ample guarantee to the parish against loss. But the old and undying spirit of resistance to improvement soon rose up in its usual place. The owners of intermediate property, like the gardeners, are afraid of having their monopoly of a fine situation infringed upon, and they threaten legal resistance. No act of Parliament, it is said, has been obtained, and the Board is not empowered to make the change. Owners and lessees of gentile houses in Gloucester-place, Baker-street, and other places, totally unimpartial of the convenience of the inhabitants of the extreme positions, petition and threaten the Board, which finds itself obliged to postpone the consideration of the subject, and will probably reject Mr. Train's offer. Again, then, we have the same story repeated, and a general improvement thwarted by the selfishness of a few individuals, Lord Portman and the Duke of Portland, by their agents, have interfered to stop the scheme, forgetting, apparently, that land is held as property subject to the public convenience, and that it would be decent and becoming in them to allow the chosen representatives of the parishioners to decide what is for the public convenience, without their special interference.

That the inhabitants of Gloucester-place and Baker-street should express their opinions on this subject—whatever they may be, and by whatever motives dictated—is quite reasonable; but since the Metropolitan Act was passed for the very purpose of enabling bodies chosen by the people to effect improvements, the objection that no special Act of Parliament has been obtained for making a tramway, *seus futile*. In the Metropolitan Act there is a very strict limitation as to the amount of money the Board of Works may expend on public improvements without going to Parliament, but otherwise such Boards are expressly enjoined to promote it; and as Mr. Train's proposal involves no expense to the parish, this ground of opposition has no just foundation. The plan has been successfully carried into execution in New York and Birkenhead, and seems very likely to succeed if carried through some of the not very thronged thoroughfares from the great suburb that stretches away to Kilburn and the busy part of Oxford-street. Omnibuses already travel in this direction; the tramway would neither make more noise nor be more injurious to property than they are, and they augment its value; but it would infringe on a monopoly of the omnibus company, and be like gas, cabs, and omnibuses, a great public convenience.

THE CONDITION OF IRELAND.

THE state of Ireland is a perennial puzzle to English politicians. Its social condition has ever been an anomaly,—not less so at this moment than at any former period; for we now behold two things contemporaneously existing, which seem to be inconsistent with each other, viz, increasing produce, wealth, and abundance in the country, and with these a decreasing population, having the same ardent impulse towards emigration as if the land the people were leaving were still blighted by famine or decimated by a pestilence.

How are we to account for this strange condition of things in one of the most important portions of the British Empire? How comes it to pass that increase of wealth and greater abundance of physical advantages, should be associated with a diminishing population and constant emigration? Why is it that when wages, on the average, were nearly half what they are at present, the labouring population clung to the soil, whilst now, with increased wages and the prospect

of certain employment, the same population turn their backs upon the birthplace of their fathers, and seek for new homes in distant climes!

These are large and difficult questions to discuss, far too large and complicated to be disposed of in a single paper. We must, therefore, divide them into—

First—The past and present condition of Ireland. The past of Ireland—that is, its state previous to the great famine of 1846, 1847, 1848; and its present position, tracing the commencement of the new era from the working of the Encumbered Estates Court.

Second—The causes of that emigration which pours with a steady, unintermitting, never ebbling flow out of Ireland, carrying with it the strongest, stoutest, and most useful portions of the Irish population.

One of the misfortunes of Ireland has been that its "condition," its "misery," its "turbulence," its "discontent," its "crimes," its "agitation," have been treated as so many party questions by British statesmen and their adherents, whether they were seeking for office or struggling to retain it. We shall avoid that mode of dealing with such a subject.

We likewise refrain from touching any one of the Panaceas—some only recommended, and others acted upon—for the pacification and prosperity of Ireland, previous to the epoch of the last great famine. We must, however, bear in mind, that up to that period Ireland enjoyed all the advantages which a fertile country and a large population could possess, by being closely incorporated with England—in having for the sale of its produce all the benefits enjoyed by an English county,—that is, free access to the richest, best-paying market in the world, whilst all that a teeming soil gave forth—corn, butter, fat cattle—were protected by high duties from a competition with foreigners.

The test of the state of Ireland, and of the manner in which it had been governed, was "the Great Famine," the first prognostications of which overclouded the horizon in the autumn of 1845. Up to that time Ireland was a great agricultural country, in possession of the English market, and protected by a Corn Law. It ought, according to all the provisions of human foresight, to have been a prosperous country, with a happy and contented population. But it was not so. The Devon Commission, specially appointed by the Crown to inquire into the agricultural statistics of Ireland, testified to the fact that Ireland—protected by a Corn Law—was in a state of frightful misery—that its population was "badly fed, badly clothed, and badly housed"—that the people were in a permanent state of discontent—that a species of pre-dial civil war was raging in many parts of the country; and that great and sweeping measures of legislation were required to put an end to the unhappy state of things that then existed.

Let it be observed, we are not now referring to any political points whatsoever—that we are confining ourselves to the social condition of Ireland—that we are directing attention to the state of the country when the Corn Laws were in force, and when a failure of the potato crop was a calamity which entered into no man's contemplation.

With the Corn Laws, and with abundant potato crops, there were widespread poverty and great discontent;—such is the evidence placed upon record by the Devon Commission.

At the same time there was in existence a new element that had been engrafted upon the social condition of Ireland—one calculated to diminish the evils of poverty, and to afford greater security to property—namely, the establishment of a Poor Law. A regular system of Poor Laws had been founded in England in the reign of Elizabeth; but nothing resembling what such a system attempted was established in Ireland until the reign of Queen Victoria! The manner in which the Irish Poor Law has been administered, and how much it has had to do with giving an impulse to emigration may be referred to hereafter. For the present we call attention to the fact—the establishment of a Poor Law in Ireland, shortly previous to the failure of the potato crop—as one of some importance in the past history of the country.

The Irish Poor Law came into operation in 1839; but none of the workhouses were opened for the admission of paupers until 1840. Thus the country had, apparently at its command, all the elements which should have made it prosperous, with the means of counter-acting, or at least mitigating any calamity that might suddenly befall it. But instead of prosperity and peace, there was poverty and dissatisfaction previous to the failure of the potato crop—and after that failure, famine and wide-spread distress, such as no other age has paralleled, and no other nation endured.

And yet, all this has passed away! and despite the famine and the misery of former times, Ireland is now, notoriously, in a state of great prosperity; its people, if not contented, are certainly quiescent; and, whatever test we choose to take, we shall find that the progress made by Ireland, within the course of a few years, is all but marvellous.

The proofs of the prosperity of Ireland, and an advance in every respect in her social and moral condition, are to be found in that truly valuable compilation of Irish statistics, "Thom's Almanac and Official Directory for 1860."

Sufficient is it to say, that whether we look to the extension of works under the Land Improvement, or the Arterial Drainage Acts, we perceive there is everywhere great, important, and beneficial change. Even the manufacturers of Ireland, so long struggling, first with bounties, and then against the most adverse circumstances, are not merely reviving, but in active operation. The substitution of machinery in place of hand-spinning has been the salvation of the Irish Linnen Trade. A new trade in "sewul muds," giving employment to 300,000 persons, has sprung up of late years. There are Cotton Factories in three Irish counties; Woolen Factories in six counties; Worsted Factories in three counties; Flax Factories in eleven counties.

Progress and wealth go hand in hand. Ireland is prospering; but contemporaneously with its prosperity we find the labouring, and especially the agricultural, population, abandoning their native land; and, to use the words of an Irish newspaper, "the tide of emigration from Ireland is becoming a torrent."

Why are the labouring agricultural population fleeing from a country which is daily increasing in wealth? Such is the question which we propose to discuss in another paper.

BRAIN-WORK, FREE AND FORCED.

MR. BURROWES, an eminent and successful private tutor at Oxford, speaking of candidates for honours, says:—"All will allow that the last few days at least should be kept religiously free from any exercise of the brain. Nothing is so completely suicidal as the opposite course." The exercise of the brain here referred to is something the candidate is excited to do by the injunctions of his tutors and the hopes of gaining honours. It is not spontaneous, except as those hopes, the result of academical arrangements, or the general influence of society can be said to be spontaneous. It is rather something he is constrained to do by others. The whole of college education, all drilling by tutors and masters into making particular exertions, is of the same description. It is strain work, rather than spontaneous brain-work; and this obvious distinction, now that men are frequently said to die of brain work, is worthy of some consideration.

When Newton prosecuted his investigations into gravity, and when Bentley tortured passages in Greek authors till they rendered up their meaning, both were delightfully engaged in spontaneous brain work. The young men who go up for honours are obliged to learn what Newton and Bentley thought out; and what they are thus compelled to learn is constrained work. Newton and Bentley did not suffer from brain disease, and from that brain work which Mr. Burrowes says is suicidal. So, when Davy, Faraday, George Stephenson, Leverrier, engaged in those labours which ended in the improvement of chemistry, the structure of railways, and the discovery of a new planet, they were spontaneous brain-workers. The men who try to learn what they discovered, and are drilled at school and college to profit by what they taught, are constrained by amition or parents to work; and what they do is the effect of the influence of other persons on them, not the spontaneous offspring of their own brains. This kind of brain work is more like the dull pacing of the ginhouse with blinkers—a cruelty which machinery, the result of brain work, has almost extirpated—than the natural and delightful gambols of the free courser. As soon as this distinction is pointed out, we begin to suspect that most of the disorders attributed to brain work result from constrained work. In common with many other disorders they are the consequences of the action of teachers on pupils, of parents on children, and generally of society on individuals, the effects of which, for good and for evil, have never been fully investigated, and are consequently not known, notwithstanding many assumptions to the contrary.

To affirm that men never come from too much spontaneous brain work would be erroneous, but it would be equally erroneous to deny that many disorders attributed to it are the result of ill-regulated and disappointed ambition. In the exhalation of young life a youth may cripple a limb for ever by over-exertion. Excess of any particular muscular labour deforms and wears out the body long before the period of natural decay. An over-anxious and too long-continued mental pursuit may, in like manner, generate nervous and brain diseases; but the great majority of such cases are rather the results of habits formed under tuition than of spontaneous brain labour. We stimulate one another into too much activity of a fruitless character. Habits begin at school or college, and are continued and strengthened by the action of society, which, naturally ignorant, is continually learning what is right. When young men use in the world the faculties which have been forced into activity while under tuition, whether they write a book, plead in a law court, or construct railways, they certainly become brain-workers, but they still work in trammels with social blinkers, and run in the round that leads to preferment without end and distinction.

We can recall, without much effort of memory, the names of a number of men of eminence who died comparatively young, as was said, from too much brain work, while they really fell victims to

disappointed ambition. Sir Walter Scott suffered from the failure of his bookkeeping speculation and its consequences, not from the delightful labour of writing Waverley and other kindred novels. Haydon did not so prematurely from his exertions to realize his ideas of beauty, but from vexation that the world did not appreciate and honour his labour. Brunei and the younger Stephenson were taken from us, long before the ordinary span of life had been reached, by mental and mental labour; but it was rather the labour of ambition, vying with one another, striving after greatness, than mere contemplative investigation, such as the modest Faraday continues to practise, and lives yet to enjoy. Both had distinguished parents to surpass, and were goaded by the somewhat ill-regulated influence of society into great and continuous labours, attended by much rivalry and some disappointment. Like the first motions of animal life, spontaneous brain work leads only to health and vigour; it is no more wearing than any equal muscular exertion; it is not suicidal, and must be performed in due proportion to secure the welfare of every individual.

We might easily enumerate too, from Hobbes or Fontenelle to Lyndhurst, a great number of renowned brain-workers who have lived long and healthy lives. To repeat the catalogue is, however, unnecessary, as we have not one only, but many living examples of men attaining great age who have been active brain-workers for many years.

To the Brunels and the Stephensons, whom we have so lately lost, we must now unfortunately add Mr. Ross, the engineer of the Victoria Bridge, the most stupendous piece of engineering work in the world. He is not, indeed, removed from the world, but for a time is invisible to its charms. "Always subject," says a communication in the *Liverpool Courier*, "to violent attacks in the head—the individual labour and anxiety consequent upon a close personal supervision, in all its details, of that stupendous structure, was too much for any one man—was, alas, too much for Mr. Ross already over-taxed brain. He is at present prostrated by paralysis of the brain, brought on by over-exertion, but is the inmate of no asylum, and there are strong hopes of his eventual recovery."

He has succeeded in surpassing his master, who is said to have doubted the practicability of the great work he ultimately sanctioned, and which is ascribed not undeservedly to Stephenson, as he was the great author of tubular bridges; but Mr. Ross's great strivings, by which the work was actually done, have ended in brain disease. Those exertions, then, which are superhumanly successful in their object, but end in the misery of the individual, should rather be depressed than encouraged. Though social development comes through individual exertion, yet it is regulated by such positive, and now, we may say, ascertained laws, that the things dimly seen, hoped for, striven for, and yet unattained in one age, are sure, if useful to society, to be achieved in another. The desire, then, to do great things for the world, involving the misery or the destruction of the individual, is to be considered a suicidal ambition. But, after all, Science and Literature must have their martyrs, as well as War and Physic. Though the Individual perishes, Society never dies—and if it can do no more for its benefactors, it can erect monuments to their memories. This is all that it has ever done, or will ever do. The more's the pity.

RURAL ECONOMICS.

A GLOOMY RETROSPECT.

It is now some nineteen hundred years that the Roman poet said, "How fortunate are the farmers if they did but know it," and from that time till the present, all other classes have been inclined to over-rate the advantages and under-estimate the difficulties of those who carry on the business of husbandry. That farmers are "grumbler's" has passed into a proverb among those who are not well acquainted with their long-suffering, their patience, and the obstacles they are subject to. The truth is, that others see the results of rural industry, and overlook the laborious processes by which such results are obtained. They see the fall and mature crops of grain or root, the fattened bullocks, and the well-fed sheep just ready for market, and they say, "Surely the producers of these good things can have no cause to complain." They do not note the toil and labour—often under great difficulties—by which the farmers have obtained their marketable productions. They feel not the wages paid week by week, the rates and taxes, and still more, the rents which must be paid to the uttermost farthing, before the farmers can call a shilling their own out of the produce of the soil of all that magnificent harvest we have been admiring. In order to grow and sell a good crop, the land must have been well drained, tilled, and manured; it must be ploughed, sown, and weeded in good season; and the crop must be reaped, stacked, and garnered in dry weather. Any failure in any one of these conditions may render the year's labour of the farmer a vain thing; may turn his expected profit into a loss, and may compel him to live upon his capital while he ventures again to till and manure, to seed and weed his land in the hope of better success another year. And after he has done his best the season may prove so unpropitious, the weather so untoward, that no care or skill, no promptitude or activity, will be of much avail. Such a year has been that we have just gone through. Yet we hear those whose businesses are carried on without any material interruption, be the weather what it may, reproach the farmers with want of activity because after a few fine days their wheat, their barley, or their beans may still remain in the field uncut. When their wheat has been of necessity stacked in so damp a state

as to be wholly unfitted for present conversion into flour, farmers are coolly told by some self-sufficient editor that no material injury has been done, and, "after all, the year has not been a bad one."

Some years ago, an instance of the value of appreciation of the toils of the farmer came under our notice. A clergyman, a resident in the country, and himself an owner of land, by the death of a relative succeeded to a farm situated in a district of poor light land, on which good crops could be grown only by a long-continued course of good management and large expenditure. The tenant of the farm, which was of considerable extent, had secured the protection of a lease, brought the land into high condition. This had been done by great outlays of capital, for which we doubt whether he ever obtained any adequate return. He was a single man and lived frugally, and the yearly increase of his stock and improvement of his farm constituted the chief gain he obtained from the protection of his business; all he was known, in a general way, to this new landlord. We rode with him and his agent over to the farm, on the occasion of his first visit to it, a few weeks before the harvest. The season had been favourable, and the grain-crops certainly were excellent. After going through several fields of wheat and barley, and admiring the crops, the new owner turned to the agent and said, "Surely, if farmer X—can grow such crops as these, he ought to pay no more rent than he pays." The agent, who was fully aware that the rent paid was a high one, and that few farmers would produce so good crops on that not very kindly land, explained to the landlord, that the results he saw could only be obtained by great outlay and long-continued care in cultivation, and that the rent paid by the tenant was fully equal to the annual value of his farm. And he added, that as there were then many years of the tenant's lease unexpired, the question was practically unimportant. The landlord was silenced but not satisfied, and remained to the day of his death under the impression that more rent ought to be paid for land where such fine crops as he had seen could be grown. Nor was this mere conjecture. He had seen the good crops, and, like the great majority of non-agriculturalists, overlooking the cost and labour of producing them, he estimated the farmer's profits far beyond the true amount.

But to our point—the aspect of British husbandry during the past twelve months. The year has been very wet—continuously, vexatiously, perpetually wet. The land has never been able to get dry. Now, despite of our modern improvements in drainage and the like, our climate remains pretty much what it was hundreds of years ago. A dry season is, as the rule, a productive one, while a wet season is the reverse. The rough rural distich,

"When the dry dews beat the wind,
All is well in old England;
But when the mud-drops fall the day,
Then, alas, sick the land lies."

is nearly as true now as ever when the year proves unusually wet.

It was about the 20th of October in 1859 that the rural world was taken by surprise by the advent of a most severe frost. After a very dry summer, September and the early part of October had been somewhat wet, and vegetation was most vigorous. By the sudden frost, mangled and trampled were stook injured, and the preparation of the land for the winter materially impeded. The frost by very late means, and while continuing throughout the winter with a few and very short intervals of frost. The autumn wheat was sown badly; much of it was sown unusually late, and many fields intended for wheat could not be sown at all. Throughout the winter the appearance of the wheat-crops was most deplorable. Scarcely a single field where the plant had shown itself above ground, no small portion of the land sown with wheat scarcely exhibited a trace of vegetation at the season when the wheat-plants were usually vigorous and fit for hoeing. Then followed a month of dry cold weather in April, during which vegetation made no more progress than is commonly made in January. In May rain recommenced, and the first effect was beneficial; the pastures became green, and the tardy wheat-plant grew with amazing, nay too great, rapidity. Through May it was rain, rain,—nothing but rain of the heaviest kind. It rained all through June, and farmers looked hopefully at their hay-crops, then large and fully matured. In July there was a fortnight of sunshine, during which a portion of the hay-crop was stacked; then rain recommenced, and by far the greater part of the hay was got together in the worst condition. No farmer remembers a season when so much bad, and so little good hay has been made as in that of 1860. August, again, was wet until the 30th; then the weather cleared for just fifteen days. But so backward were the crops at that period, that the farmers were unable to reap many of the winter fields. These fifteen days of weather were not so favourable as they might have been. The frost was too dry weather—and though dry the temperature was very low, and there was but little sunshine—did no more than ripen the grain-crops in the greater part of England, so that cutting was just becoming general when the rain returned, and was a uniformly and disastrous spectacle. The weather, however, presented throughout the remainder of September a more favourable aspect than this country. Early in October we had eight days more without rain, and during that period most of the grain-crops were carried to the stackyards as they best could be. Still some wheat was abroad, and on the 22nd of October we have seen wheat, after only three dry days, stacked in a very damp and unsatisfactory condition.

As for beans, they are still in the fields, greatly retarding the preparation of the land for next year's wheat, and affording the farmer of this generation a taste of the quality of our seasons such as they had only known previously from their fathers' report. At the end of twelve months of unexampled wet weather, what is the position of the farmer? His wheat has been harvested in such ill condition that it will not be available for use until next February or March. The straw he requires for cattle is not forthcoming, and the money the wheat usually contributes towards his rent, taxes, labour, and treatment of his stock, is locked up in his damp and damaged unsampled wheat. His pasture land is so saturated with water that he will not afford so much food for his stock as usual; while roots are everywhere—on all soils and under every system of management—absolute failures. The wheat which, under pressure of necessity, has been threshed, is so damp that millers will scarcely look at it, unless they have kilns for drying it; and then the price is necessarily reduced. As there is no doubt that there is a real and serious deficiency in quantity, weight, and quality. Imported corn will prevent the public from suffering more than enhanced prices from our late disastrous year, but to not a few of the farmers the evils of the bad season of 1860 will be crushing and irreconcilable.

war. The article, after considering the position of each of the Great Powers, draws the conclusion, that a conference is possible, and defines the part that France would take therein. In conclusion the article asserts that an organized and powerful Italy is henceforth to the interest of Europe; and that in concerning it by an act of high jurisdiction, the Powers would show as much prudence as justice.

This article has been followed by another manifesto of the same kind, which is believed not to have been sent to the press until it had also been perused by the Emperor. It endeavours to prove that Austria is on the eve of invading Italy. For what other reason, it asks, has General Benedek been sent into Venetia? Why have the Hungarians been pacified? The conclusion comes to, that France should tell Austria that any attack against Italy, any offensive operation beyond the Po, will be considered a declaration of war, and followed by an immediate intervention. This article has made a great sensation in Paris.

The *Opinion Nationale* of Wednesday asserts that Austria has already notified her intention to cross the Po, to France and England.

The Syrian Relief Committee at Beyrout have transmitted to London a statement of their proceedings during the last month. They had taken steps to relieve 2,500 starving refugees at Tyre, but feared that several thousands at Damascus at Beyrout would become dependent on their charity, as the Turkish authorities had intimated that they would receive no further aid from Government. There was every appearance of permanent tranquillity, 10,000 refugees had returned to their houses in the Lebanon. A new outbreak, however, is since apprehended at Damascus, in consequence of the war-tax.

A supplement to the *London Gazette*, dated Thursday evening, contains the first series of the long-expected details of the Convention between Her Majesty and the Emperor of the French, supplementary to the Treaty of Commerce of the 23rd of January last—negotiated by Mr. Cobden. We have not space this week to specify the various articles of English produce and manufacture which are to be admitted into France at reduced duties; or from which the prohibition formerly existing has been removed, and replaced by an *ad valorem* duty. It is only to metals, cutlery, machines, and machinery that the present installment of the treaty refers. In every case there has been a reduction of duty, or a removal of prohibition. Though not exactly *Free Trade*, as Englishmen understand the phrase, the Treaty is an approximation towards it, which is not so likely to excite approbation in France as in England. But we must reserve till next week, and for another portion of our paper, what more we have to say upon a subject which will doubtless cause much discussion between this time and the meeting of Parliament.

The twentieth anniversary of the Huddersfield Mechanics' Institution was celebrated, on Saturday last, by a *soirée*, held in the Philosophical Hall of that place; Lord Brougham presided. In his speech he alluded to a recent article in *The Times*, in which it was asserted that mechanics' institutions, after being filled with electrical machines and plaster casts for a year or two, lapse into half-rooms or dancing-salons. He denied that this was even an exaggeration of the truth. It would have been as accurate to have said that they had been turned to the purposes of gin-shops or ale-houses. He said, during the last thirty years, maintained close intercourse with several hundreds of these institutions, and he never knew one instance of such perversion. Instead of going down, they have, within the last few years, in all parts of the country exhibited unmistakable symptoms of vitality.

On the same day, a ceremony of an interesting character took place at Highgate. In presence of some 6,000 people, Miss Burdett Coutts presented a silver eagle to the Highgate Rifle Volunteers, as a gift from the ladies of the district. In doing so, she delivered a short address, in which she alluded most appropriately to the purposes of the Rifle Movement, and to the feelings of gratitude which the sensitive patriotism it indicated had called forth among the ladies of England.

The liberal offer made by Mr. Train to construct street railways, on trial, in the metropolis, and to take them up if they should be found to impede traffic or otherwise prove inconvenient, has not been favourably received by the inhabitants of the districts through which the proposed lines pass. In Marylebone a violent agitation has been got up against the scheme, which was discussed at a meeting of the representative council on Saturday last, for the third time, without any conclusion being come to. In the mean while, however, Mr. Train has applied to the Commissioners of Sewers for permission to construct railways in some of the principal thoroughfares of the City, and there seems every probability that from them he will meet with a more patient hearing.

The annual demonstration of the Unionist Conservative and Agricultural Club took place at Castle Hedingham, near Halstead, in Essex, on Friday last. Major Bunsford, the leading speaker, who is accepted during the recess as a faithful exponent of the opinions of the Conservative party on current topics, referred to the Italian question. He looked upon Garibaldi as a hero; he hoped that the cause of freedom might be successful in Italy; and he thought that the King of Naples, by his misgovernment, had rendered the invasion of the Two Sicilies "quite proper and right." Mr. Da Cune referred to the same topic. While maintaining the doctrine of non-intervention he hoped that the herculean efforts of Garibaldi might be directed into a right channel, and that a brighter era was henceforth in store for Italy. Such are now the opinions of English Conservatives.

MONEY AND COMMERCE.

If the Bank of England only waits, as we mentioned last week, to see the effects on the money market of the payment of £3,229,835 as dividends, &c., on account of the Government, before it alters the rate of discount, it is at present fully justified in not minding the rate. Money, though it has been in good demand in the week at the full rate of 1 per cent. for the best bills, is abundant; and the stock exchange, which last week and the week before could not get supplied under 31 and 1 per cent. for temporary loans, has, within these two days, obtained them at 2 or even 11 per cent. In fact, this large sum of money transferred from the use of the public, when commerce is not particularly active, cannot be so readily put out to use. Simultaneously with this change, the immediate wants of the continent for gold appear to have been supplied, and, for the moment, the expectation of a rise in the rate of discount is suspended. The postponement of the rise can, however, be only temporary.

We require every year large supplies of corn, and, to make up the deficiency of our harvest this year, our demands are much larger than usual. France, too, which last year sent us a great quantity of wheat and flour, this year requires to import a great deal for the use of her own people; and this extra supply for both nations must, in the first instance, be paid for in gold. There will, therefore, be a drain on the gold circulation of western Europe, and our share of the precious metals will inevitably be diminished. Nationally, this is no great misfortune; but it affects us more acutely than other countries, in consequence of our own legislation.

Credit notes, founded on the precious metals, are quite as necessary for the business of society in its present development as the precious metals themselves. Being necessary, there must be a proportionate quantity required, which increases with the amount of business to be done. But by legislation this quantity is limited to what was supposed to be sufficient, though in reality it was not, in 1844. It has even become, by an unexpected effect of the law, limiting the amount of notes issued by country banks within the prescribed limits, actually less than it was then. Without a sufficiency of this species of currency, business cannot be carried on; and so the Legislature has thought, for it has declared a particular portion of paper currency to be a legal tender, but it has arbitrarily limited the amount to a sum barely sufficient for the exigencies of society forty years ago. In consequence of this narrow limitation, and being regulated by the gold in the Bank of England, the egress and ingress of this metal acquire a prodigious importance. To lose £5,000,000 gold is also to curtail the legal tender £5,000,000, and the two sums bear a large proportion to a currency so strictly limited in amount as is our paper currency by law.

Unless this abnormal condition is always remembered, the egress and ingress of gold cannot be rightly appreciated. Over this limited sum, three millions in the hands of the Government or in the hands of the public, has much influence, and hence the late transfer from the former to the latter has given momentary ease to the money market.

The Bank returns last week tell us that the public deposits then amounted only to £3,251,100, or nearly £1,600,000 less than at the same period in 1857, when the money-pressure was intense, while the private deposits are now £3,300,000 more than at that time. Taking the two sums together, the Bank has now £1,600,000 more money intrusted to it by its clients than in October, 1857. On the public deposits, however, the Bank can rely. It knows before-hand when they will be required, and that legislative measures would be instantly adopted were those deposits to be exhausted; but the Bank never knows when the deposits of its private clients may be demanded. For it, as for other banks, the deposits of its customers are the sources of its profits, and the diminution in the amount of the public deposits lessens both its means of securing trade and of making money.

It has long been said that the Bank must in the end adopt the practice of other joint-stock banks, and obtain large deposits by allowing interest on them; and this event seems likely to be hastened by Mr. Glyn's reduction of the public deposits. All these things are parts of one system, and the effects of his recent plan of eluding out his resources, by diminishing the public balances in the Bank, over the restricted legal currency, have yet to be ascertained.

The funds and share market have undergone few changes in the week, and *Cornola* continue to fluctuate only between 92 and 93. The share market continues firm.

The corn-trade is not particularly active. In Mark-lane the price has not advanced this week; but in almost all the provincial markets the wheat has been found so inferior, or in so bad a condition that apprehension has rather increased, and prices in them have generally had an upward tendency. This condition of our corn-markets continues to influence all other markets. They are generally steady but without animation.

The Tea-market is an exception. The improvement we noticed last week has continued this week. Tea has been in active demand at improved prices.

Tallow also has lately risen considerably in price. This article being of a limited quantity is very frequently the subject of speculation; at present, probably, the supply, owing to the season which has kept cattle in a low condition, may be short.

At the meeting of the Royal Mail Steam Company, on Wednesday, a dividend was declared of £2 per share, free of income-tax. The shares are of £100 each, with 250 paid up. Now, when it is remembered that this company reeves upwards of £18,000,000 of the public money annually, it is plain that this subvention does not tend to the advantage of the shareholders. Mr. Baines of Liverpool, or any other private shareholder, would not be satisfied with such a proportionate profit as 7 per cent. on his capital. In spite of the large sum obtained from the Government, the Company is not, and never has been very successful. It takes money from the public, and neither employs itself or the nation, as a private trader would do.

an historian of the period) less than the strength of giants, they could not have outlived themselves. The British Government saw, and looked with apprehension as it saw, the struggle of this gigantic establishment. From Liverpool to Penzance there was not a single town but would have felt its life. In Sheffield and Birmingham, and the towns surrounding them,—in Manchester, Leeds, and all the great factory communities, a large number of merchants and employers, and, as a matter of course, every man and woman employed were less or more involved in the fate of this establishment.* Mr. Brown in this emergency acted like a man of sense and spirit. He put himself in the mail-train for London. He asked an audience of the Directors of the Bank of England. That was an anxious day in the Bank parlour. Fortunately the Bank had, in Mr. Curtis, a chairman who had unlimited confidence in the candour and integrity of the Liverpool merchant and banker. Mr. Brown satisfied the director that he only required temporary assistance, thus making allowance even for a serious depreciation of prices, he held securities more than sufficient to cover all his liabilities, if time were given him to realise them and obtain remittances. The Bank took the protracted bill, and other securities offered, and then informed Mr. Brown that he might draw upon them for £1,560,000. The decision of the Bank of England gave unbounded joy in Liverpool and the manufacturing districts. A hundred firms breathed more freely for themselves, and acknowledged that they as well as Mr. Brown had been saved from bankruptcy.

The Bank advanced Mr. Brown £500,000 in cash, and not a few bills. Meanwhile energetic measures were taken by the agents of the firm in the United States, who remitted money to Liverpool by every vessel. It is said that the Bank of the United States, by its chairman, Mr. Biddle, having received £1,000,000 of money from the firm, gave them a letter of credit for £300,000, for which they were to be charged 2½ per cent.; but the Bank of England, being informed that this credit was to cost £10,000, declined, in the most liberal manner, to receive it, stating that they were quite satisfied with the credit of the house, and the securities they held. In about six months Brown, Shipley, & Co. were enabled to discharge the loan with interest, and had the gratification to receive a letter from Mr. Freshfield, solicitor to the Bank, stating that he was ordered by the directors to inform them that they never had a more satisfactory transaction with any house. If the commercial crisis of 1815 had been William Brown's Assaye, and 1825 his Vittoria, that of 1835 was his Waterloo. He had only called upon his resources to stand by him until his allies came up, and then the day was his own.

Here we must leave our "Man of Mark" for the present. Next week we shall conclude his honourable story.

THE GOUTY PHILOSOPHER.—No. XVI.

MR. WAGSTAFF VISITS A COBBLER, AND DISCOVERS ABOUT THE GREAT AND SMALL COBBLERS OF EUROPE.

I HAVE discovered, from long experience, that a man who uses his brains and his stomach too much, and his legs too little, is far more likely to have the gout, than the wiser man, who allows all his functions and faculties to have a fair chance, and who gives his feet as much exercise as his cerebellum and his cerebellum. I can tramp twenty miles before dinner, and still nothing of the effort. In fact, it is no effort, but a pleasure. Neither an ill as I go. I never whistle for want of thought, but use my eyes for the discovery of beauties in the landscape, before unobserved. I look for new wild flowers by the wayside, and study the habits of birds, beasts, and insects. I have experimented upon ant-hills by the hour, much to my satisfaction, if not to that of the ants, and have made intimate acquaintance with multitudes of God's humblest creatures, and learned, I hope, many lessons of becoming humility, as well as of true piety from what I have seen. I do not much care to fall into conversation with tramps or gipsies, or prowling vagabonds and professional beggars;—these people know me, and keep at a respectful distance from my path. They fear the squire of Wilby Grange, and the corrective discipline to which they are likely to be subjected, if they come before him when he sits on the bench of justice. But I like to discourse with honest working men—with shepherds, farm-labourers, gardeners, rat-catchers, pedlars, and, above all, with cobblers. For this latter class of artisans I have a great respect. They are generally good logicians—observant and contemplative men, who think over their work, and form their own opinions. One cobbler, whom I highly esteem, lives about seven miles from Wilby Grange; and not only useful, but makes, all my shoes and boots, putting real honest work into them, and taking particular care of my gouty feet. I often pay him a visit after breakfast; and I am sure that I learn from him quite as much as he learns from me, and that he has far more brains, and makes a better use of them, than our country member.

"There is not," said he to me one day, "a sovereign in Europe, unless it be Queen Victoria, who is not a cobbler and patcher-up of old shoes; and if she be not a cobbler, some of her ministers are of our craft. Sitting upon my bench, with my lapstone in my lap, my hammer in my hand, and much meditating after I have read my penny paper, I have come to the conclusion that I know quite as much of Europe, and what the people of Europe want, and will have, as the squires and great people of England, or Napoleon III. and M. Thiers, Francis Joseph and Count Reichenberg, Victor Emmanuel and M. Cavour (cobblers of an Italian boot), Pius IX. and Cardinal Antonelli. All these great folk grope the little folk, and think much more of the shoe than of the shoe's wearer. The people themselves will have to teach them better by-and-by, for nobody knows so well where and how much the shoe pinches, as he who has to walk in it."

It will be seen from these remarks, that my friend the Cobbler is a bit of a Radical, but though he knows me to be a bit of a Conservative, he

respects my opinions just as I respect his; and, with an occasional difference, we get on very well together.

"Upwards of three hundred years ago," he continued, "the people of England had a pair of shoes and a pair of boots—the shoes their civil and the boots their religious system. Neither shoes nor boots were good fits. They cramped the feet, and produced corns, bunions, and blisters. There was no walking comfortably in either of them; and, after a good deal of cobbling, the people succeeded in getting rid of both. They first kicked off their boots, and tried on a busa new pair, which fitted them precisely,—which boots I call the Reformation. They next kicked off the old, lumpy, shoddy and unwieldy shoes, which James I. and Charles I. had insisted upon their wearing, and expressed a determination to go bare-footed rather than submit to be crippled any longer. Oliver Cromwell—shoemaker as well as soldier—provided them with an easier pair; with which, aided by an occasional soling, healing, and wringing, they have managed to walk on comfortably enough in the path of constitutional liberty."

I was so pleased with Crispin's idea, that I took it up and made it my own. "And from that day to this," I added, "they have been better shod than any nation of Europe. So easily have they tramped along, that the French, who, according to Oliver Goldsmith's old soldier of Marlborough, 'were a nation of slaves and worn wooden shoes,' began early in the eighteenth century to crave both boots and shoes of the English fashion. Kicking off their sabots in 1789, they danced about barefooted for a considerable time, playing very remarkable antics in their unwonted freedom, and knocking their unprotected shins against some very sharp and disagreeable flint-stones and jagged pieces of rock and fragments of broken bottles, till their poor feet were cut and mangled in a shocking manner. They were then glad to put them back again into any kind of leather or even of wooden shoe that would preserve them from cut and bruise. And then appeared the greatest Cobbler who ever lived in the modern world—one Napoleon Bonaparte—who, finding a pair of old military boots by the roadside, blacked and polished them, stuck a sharp spur into each heel, jammed the feet of France into them, and set the nation upon homelock to conquer the world. But the boots were a tight fit, and the more they were cobbled and patched, the more uneasy they became to the feet of the wearer. Blistered and corned, and bunioned, and, in fact, quite lamed, France was delighted after a short time to pull the boots off and throw them into a corner, and go back to the old sabots, or wooden shoes, originally made by some expert old cobblers of the Capet family. But these were not only antiquated in shape, but too small for the feet that were to receive them. The feet had grown, and the sabots were unserviceable and unmanageable; and they, too, were kicked off after a short and uneasy attempt at walking in them; and the French tried on a pair of old Orleans slippers. They found the slippers for a while exceedingly loose and comfortable. But they were much too shabby for a well-dressed nation to wear, and let in so much slush and dirty water as to be dangerous to health, if ever the nation stirred out of doors. Off went the slippers in a fit of passion, and France once more went barefooted, and positively revelled in the delight of the new sensation, kicking up its heels like a drunken nigger in the exuberance of its emancipation. But what happened before happened again. It knocked its defenceless shins against some very sharp spikes and broken glass, and crippled itself completely. Another true and steady cobbler of the old Napoleon stock saw his opportunity. He snatched up the identical old pair of heavy-spurred and tight-fitting military boots that were cast into a corner in 1815, and squeezed the feet of France into them a second time; and though France made some very faces, the boots were so well blacked and shining, and looked so uncommonly well when on, that the nation agreed that this cobbler was the best cobbler after all,—that the military boot was, like moly, 'the only wear';—and that the bourgeois shoes or slippers, or the rural sabots, were not to be compared, for a moment, with the boots—that is to say, for show, and for producing an effect on the world."

"Do you not think, sir," said Crispin, "that the cobblers of Europe stick rather too closely to the old wear? Shoes are very well, either new or old, provided that they fit; but, after all, the wearer of the shoe has some right to choose his own shoemaker, and to get rid of his old cobbler, if he no longer gives satisfaction; and may they not go barefoot if they please?"

"Undoubtedly," I replied; "and I do not believe that the military boot is at all suited to the necessities of our age. Thoughts now run over the world with considerable rapidity. They link all the nations of the earth together, and do not wait for passports, or to be examined at custom-houses. Paris, Manchester, Berlin, Munich, Dresden, St. Petersburg, Milan, Naples, Madrid, Lisbon, even Rome and Constantinople, are all stations upon the telegraphic line of thought. Printed or spoken, the thought goes. A message of freedom sent from one terminus, is punctually delivered at the other. It must reach. You cannot destroy the wires. They link us all into one system, and John Smith, cobbler, of London, can speak to Palliase, cobbler, of Paris; and Palliase of Paris can tell Hans, cobbler, of Germany, things that the German would like to know; and say German with eyes to read and a tongue to speak can pass the watchword, not knowing where it will stop. Let a thought be but true, something that the heart of a man can feel, whatever may be his country, and, like a stone loosened from a hill-top, it must run. This is the glory, and perhaps the danger, of our time. The old landmarks of society are being torn up. Some prejudices, like old trees in an American forest, too strong to be rooted up, are cut down.

And the great yet simple truth which it has taken two thousand years to teach, begins to be understood elsewhere than in England and in America—that a man is a man, and that the biggest, wealthiest, most privileged of men is no more. There is an idea abroad that he alone is less than a man who is ignorant and immoral, who is brutal or drunken, or who cannot read, write, or think; and that he alone is greater than his fellows who is better informed and more moral, more wise, more truly religious than they are. This truth has been long seeking to establish itself, and when it is established, Europe will have well-litning new shoes, and will not stand so much in need of cobblers as it does at present."

"Yes, sir," replied Crispin; "and if the great cobblers of Europe do not see things in this light, and take them to heart, and act upon them, I can only say that I think I can see a little further through a millstone than they can. There is a hole in the middle of my millstone that lets in the daylight, and there is none in theirs. I can see, if they cannot, that the revolutions of Europe, so far from being ended, have only just begun; and that cobbling, and the best of cobbling too, will not preserve the rotten old shoe for ever."

Walking leisurely home, I mused upon what my friend the cobbler had said, and thought that in the main he was right. And though he was a cobbler, if he were a man of sense, had he not as much right to speak his mind upon public affairs as the three tailors of Tordsey-street, the Maypole-vestry, the editor of *The Times*, the member for Great Mutfington, or the great-grandson of any ennobled varrier or Lord Chancellor of a past age? I asked myself, if, after all, a statesman, even of the highest mark and experience, were anything but a cobbler. Was not the great Cardinal Richelieu a cobbler? And the famous financier, Necker? And the eloquent Mirabeau? And the ruthless and incorruptible Robespierre? And the all-grasping Bonaparte! And the polite Metternich! And the sardonic Talleyrand! And poor, wretched old Louis Philippe! Nay, for that matter, what is Lord Derby or Lord Palmerston, Mr. Disraeli or Mr. Gladstone? Are they not cobblers every one of them?

TO WN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

THE "Warsaw conferences" form the most exciting and uncertain topic of talk in all political circles. There will be no present action in any part of Europe; but an understanding will, no doubt, be come to by the Northern Powers as to a consolidated action in the case of certain future emergencies. The Emperors of Russia and Austria and the Regent of Prussia will protest against the irregularity of the proceedings in Italy; but, if I am rightly informed, they will protest separately, and will avoid the appearance of present concert, even in words. The consolidation of the sovereigns will be limited to a carefully defensive course. They will be content with restoring amongst themselves the concord that had been broken by so many jealousies and want of co-operation during the last ten years; but they will certainly not agitate matters by throwing the first stone, and being the first to commence a European war. Even Austria will not—dare not—assume the aggressive again, although she is threatening the Italian frontier over much. There is every reason to be sure that Italy will be allowed—thanks to France and England—to settle its own affairs.

There is a very significant passage in the answer of Victor Emmanuel to the Neapolitan deputation which came to request him to put himself at the head of United Italy. He reminded them that they had not yet obtained the key of their house—meaning Venice. He added a hope that Italy would supply 300,000 soldiers before the spring. Since he spoke these words, he has crossed the mountains of the Abruzzi, and having made a short halt at Venafra, west of these hills, he was left marching on Capua, before which town, or more likely within which town, he has joined the legions of Garibaldi ere this. He will make his public entry into Naples on Sunday, by which time the vote of annexation will be taken throughout the whole of Southern Italy. The news of the Italian vote has just arrived by telegram. The vote of the continental portion will probably be reversed to-morrow. Events march too fast for the dull deliberations at Warsaw.

The Prussian manifesto to Turin—following up the loss of British confidence put forth in the official journal of Berlin—has warmed up the hostile feeling against Lord John Russell's despatch, which, to say the least of it, was ungenerously worded, and unnecessarily harsh to the struggling cabinet of Sardinia. The despatch was written before Lord John Russell went to Germany, but people put that, and that together, and are so very satisfied with the coincidence between the ministry tone of the British minister, and the exposition of absolutist doctrine by the Prussian minister of Berlin. It is remarkable that Baron Schinkel is not at Warsaw—which is all the better. He is said to be ill-disposed. If Prussia looks for English sympathy or aid, she must be earnestly liberal and national, and keep out of the meshes of the Northern Courts.

The address of the National Defence Committee of Belgium to the Minister of the Interior is a document well worthy the serious attention of citizens as well as ministers, in England as well as in Belgium. While it breathes a spirit of moderation which can give an office, the patriotic determination it contains, as true to the antecedents of Flemish history, must excite our sympathies and secure the respect of our colleagues. We see in this another proof of the *revanche* Napoleon III. is, perhaps unconsciously, rendering to liberty in Europe. By placing arms in the hands of freedom who value the liberty they enjoy, he is rapidly circumventing the reign of despotism; and by evoking the warlike spirit which seemed to have died out in the middle classes, he is crystallising—though in a way he little dreamed of—the empire of peace.

The English "Tourists" to Mount Etna have arrived at Naples, and in con-

junction with those of their countrymen who preceded them, have been enrolled into a battalion of armed men, under the command of General Pavia. They have been enthusiastically received in Naples, and are already complimented by Garibaldi, by being placed near his person in the front of the line. The young "Captain Sarsfield," who starts every morning from Naples to the front of the fight, is no less a person than the heir of the late Sir Stuart, the young Lord Seymour, the future Duke of Somerset, who is found, amongst many of the best blood of England, fighting on freedom's side.

Another of our Waterloo officers, friend and companion of "the Duke," has gone to his last rest. The Duke of Richmond has died the Marquis of Anglesey, and the Earl of Strathfield, with whom he was associated in the great campaign, and with whom he was intimately connected by close family ties. The young generation of Pagets, Lennoxes, and Byngs have high examples before them, if their country should demand such sacrifices of them, as their fathers encountered with glory and honour to country. The present race of London lords only distinguished themselves in country jockeying in Sussex, a good part of which will be taken out of their hands by the loss of the Lord-Lieutenancy of the county, which I fear they almost for the worst purpose purport. There is talk of the Earl of Chichester as the next Lord-Lieutenant.

The papers of this morning all into a mistake, when they say that the Garter is not to be given away, but taken up by Lord Derby. The ex-Premier did receive an extra Garter on leaving office; but he became one of the ordinary knights on the death of Earl de Grey in November last, when Lord Palmerston declined to fill up the vacancy. Lord Melbourne said, when asked why he did not take one of the many Blue Ribands awarded during his ministry, that he did not see the force of bribing himself. It is not unlikely that the vacant Riband will be conferred upon the Duke of Newcastle, who is expected to return at the end of next week, with his royal charge.

The visit of the heir-apparent to the tomb of Washington has done more to rub out the memories of former faults than any event known in history. There was an incident in the visit to the house of Washington which I do not see recorded in the English press. It was the presentation to the Prince of a photograph of Roosevelt's picture of the visit of Lafayette to his great chief in August 1784, when the latter, to use his own words, "had left the battle of the camp to return to his domestic walks."

The Metropolitan Board of Works have at length done something to reconcile us to their many bickering and delays. The new railway, now nearly complete, between St. Martin's Lane and Covent Garden, is a re-annexation—and I used an example—one of the best and most needed improvements of the Metropolis. It is well constructed, and seems admirably fitted for its purpose—that is, to contain all the gas, water, and sewage-pipes, having connecting pipes to every house on either side. There are perpendicular shafts to the surface about thirty yards apart. The whole seems so simple and well-contrived, that one cannot see why it is not at once extended to all the leading thoroughfares of London.

Not to speak of the constant interruption of traffic, and the danger to health, of perpetually taking up the street, this new system must bring about a considerable saving to all the public companies, who ought to join cheerfully in the cost of constructing such an admirable work. The new street carriages of Mr. Train will, no doubt, be a great improvement upon the old omnibuses, which the General Company seem bent upon not improving; and the enlargement of both sides of the Thames will be more important still. But for comfort, cleanliness, health, and public convenience, these subways are the most valuable inventions of modern times for this vast and overcrowded city.

The question raised a little while ago by one of the *Quarterlies* respecting the pecuniary subventions to the Tory press, has received a fresh elucidation during the week by the publication of a circular, signed *Esquire*, and Henry Edwards, of the regular bage-litter class, with the concurrence of the heads of the party—the "great Conservative Party"! Lord Ingestre does not deny the authenticity of the letter, but complains of its publication, being private and confidential. This time the bage-litter is leaved upon behalf of a weekly "organ." I remember having a good story on the advent of the Conservatives to office in 1852. The regulator of a very heavy tribe to a Tory daily paper, which had changed hands, was requested by one of the heads of the party to send one of the gentlemen of the establishment occasionally for instructions. The go-between answered immediately, "Oh, my lord, there is not a gentleman left on the paper; so if you want anything, you must send for me!"

THE SHAKESPEARE IRELAND FORGERIES.

IV.—THE DETECTION. MONTAGUE TALBOT AND WILLIAM HENRY IRELAND.

The first disclosure of the Shakespeare fraud was made by the forger himself, when, in 1796, he published his "Authentic Account." But the forgeries had been detected nearly a year before; and throughout the whole time that Ireland was plunged into a fierce controversy upon the question of the authenticity, there was a second person who could have set it at rest at any moment.

Amongst William Henry Ireland's contemporaries of New Inn was a young Irishman, Mr. Montague Talbot, who was also intended for the legal profession, and was then under articles to a conveyancer. According to the "Authentic Account," Talbot had finished his articles before the forgeries were begun; but, being afterwards a frequent visitor at chambers, he had opportunities, from time to time, of hearing all about the alleged discoveries. We have reason to believe that this version of the story is incorrect. The circumstances, as related to us by Talbot himself, justify the inference that his articles had not expired till some time after the forgeries had been in progress, and that, while Ireland was engaged upon his deeds and atrocities in our room, Talbot was occupied with his legal studies in another, upon the same floor, in the same buildings, only a few windows off. So slight a

lent page for print collecting, in 1814; besides numerous smaller poems and translations from the French. His career among the booksellers was arduous and of little profit. He sank into a lazzaretto, and undertook all kinds of jobs upon any terms of remuneration he could get. He once put forward proposals for the publication of his own memoirs in two volumes; but the project fell still-born for lack of subscribers. The truth was that nobody believed in him. The indelicacy or delinquency of his youth dogged him through life. Distrust of his moral character followed the knowledge of his literary misdeeds; he was persecuted from his youth to his death, and wherever he went the name of the forger clung to him.

But there were some bright openings in an existence otherwise dark enough. The notoriety of his Shakespearian misadventure procured for him the appellation of the Modern Chatterton. Most people would think such a sobriquet a mark of opprobrium; others thought it romantic. There is no accounting for this sort of morbid sentiment, especially when it takes possession of the imagination of a woman; and William Henry Ireland was more fortunate than he deserved to be in the influence it exercised over the feelings and the judgment of a lady of considerable personal charms and some fortune. The lady was descended from the Culpepers of Kent Garden, a family famous in the Civil Wars, and was the widow of Captain Paget of the Navy, a nephew of the Marquis of Anglesey. Attracted by a reputation which it had been wiser and happier for herself to have shunned, Mrs. Paget became the wife of William Henry Ireland. The marriage was unfortunate. It was arduous on one side and speculation on the other. Ireland's musings, so brilliant and liberal abroad, seldom brightened his home. He was the gayest of men out-of-doors. His spirits never broke down till he got back again. Wretched stories are told of him, but we willingly drop the veil upon them. It is easy enough to comprehend all that may be predicated of a reckless liver, who found enjoyment everywhere except in his own house.

He had other chances, too, of making a position, which, like this marvellous chance of his marriage, he threw away. At one period, during the long war, he was appointed governor of a fort on the coast in which French sciences were taught. Here, too, he was disappointed. He was never loved; but it is known that he afterwards went to France, where he had interviews with Napoleon, which were suspected, whether truly or untrue, cannot be now determined, to have had reference to objects that compromised his allegiance.

The end of this chequered history was in keeping with the beginning. Society never forgave the fraud. It refused to accept the poetical avowals of one by whom it had been already deceived, and it punished in the man the guilt of the youth. Ireland, who had latterly led a squalid life in his old night haunts in London, died in obscurity in 1835. The penalty he paid for his early offences was, that he was never again able to rise to anything striking. It exemplifies better than a thousand boulders the danger of the first fall from rectitude. One such example is worth a whole library of precepts and proverbs.

THE SCIENCE OF THE SEASHORE.—No. II.

THE BORING MOLLUSCS.

A CHAPTER or TWO on the molluscan creatures inhabiting shells, whose delight it is to bore their way through the hardest substances, and to live and die within their self-made homes, will probably be, to most readers, a revelation of things unknown, and yet well deserving to be known. It will show them that the art of tunnelling does not originate with man; that a little shell-fish has been practising this art long before military works and modern engineering triumphs were dreamt of; that the Titans tunnel was suggested to its engineer by the borings of the Teredo; and that these little animals, unknown to nine-tenths of mankind, have been, and are still able to make their way in the world through the wildest timber and hardest stone; and are able to do all this in a manner so secret, that the most careful science has failed to find out their mode of procedure, and the most accomplished naturalists have discussed it, and differed about it for nearly a hundred years, and have hardly yet concurred in one opinion on the subject. Neither Garibaldi, nor Louis Napoleon, nor Pitt IX., are greater puzzle to politicians than the Teredo, the Pholus, and the Saccaria are to conchologists. A few weeks or months will probably unveil the plans and prospects of the mighty men; but fifty years have scarcely disclosed the entire and mysterious mechanism of the testaceous bore. The greatest wonders of creation are not always to be met with in kings' palaces, and among human beings arrayed in purple and fine linen, but often in the most silent and obscure of the molluscs are living unknown lives, and building up their own shell palaces, and hollowing out vaulted chambers in scattered blocks and boulders, or in some drifting log that bears in its own heart a little colony of busy and being inhabitants.

To begin with the *Teredo*, which is a Greek word (*terdon*—from the root-verb *tero*, I bore): it is a slender worm-like thing, but scientifically an Acephean Mollusc, belonging to the same class as the oyster and mussel, although there seems to be no resemblance between them. It is a kind of worm of a greyish-white colour, sometimes as much as a foot in length, and from six to eight lines in diameter. Its head is extremely remarkable, resembling head (fig. 4), while the other is like a forked tail. This creature inhabits the tube, shown in fig. 1, as embedded in wood. It has been known even from the days of Aristotle and his pupil Theophrastus, the Greek naturalists, more than 200 years before our Christ. But it is chiefly in these latter days that it has been scientifically studied, and its several species discriminated. Indeed, it is only in 1860 that we have a synoptical list of the British species of *Teredo*, and but one or two scientific conchologists are known to us who have made the Teredines their special study. One of these resides in Guernsey, and is a monk or two, exalted to us by his valuable collection. Another, Mr. Jefferys, contemplated an important scientific work on the British Teredines to the last meeting of the British Association at Oxford. We now, therefore, know a good deal that is accurate and reliable on this curious genus. It should, however, be remarked, that in 1733 Sellius published an elaborate monograph on the Dutch ship-worm; and even those eminent medical philosophers, Boerhaave and Boerhaave, Sir James Brouncker, did not think these molluscs beneath their philosophical scrutiny,

and published a valuable paper upon them in 1806. Ordinary people, and especially ship-builders, have long known and dreaded it under the name of the ship-worm, and many must have seen its fearful ravages in ships' bottoms, or in timber exposed to the sea. In fact, this little creature has raised its apparently contemptible self to a pitch of eminence almost romantic, until it has become the dread of mighty nations. The Dutch, in particular, have had good cause to fear it, for at the beginning of the last century one-half of Holland was nearly engulphed in the waves in consequence of all the piles which supported the large dykes having been undermined and rendered rotten by the Teredines.

The French Government has issued two Commissions at different times, and the Dutch Government has lately published the Report of another Commission which was appointed to inquire into the best method of preventing the ravages of this little animal in ships and harbours, and to ascertain the British Government has done nothing of this kind; but everybody knows their ships are copper-bottomed, and chiefly with a view to prevent the destructive effects of the Teredo's entrance. A committee, however, of the British Association has been formed with this view, and we may expect to hear in due time of some practical remedy for the attacks of the Teredo-worm upon our ships and harbours. So fearful has it long been, that Linnaeus called it the "ship's calamity" (*colymbia marina*), and numerous remedies have been proposed during the last two or three centuries.

All the Teredines are believed to be marine, with, perhaps, the exception of *Adamsia's* *Strigosa* species, and one which has been lately found in the River Ganges, the water of which is fresh for about eighteen hours out of the twenty-four. They undergo a series of metamorphoses; the eggs being developed into a sub-larval form (*larva* is the term applied to an insect in its first active state), after their exclusion from the ovary. In this stage the larva is about the size of the fry in fishes, and has a pair of shining oval valves, as well as with cilia (microscopic hair-like bodies), a large foot and distinct eyes, by means of which organization it swims freely, and with great rapidity; or creeps, and afterwards selects its fixed habitation. The larval state continues for upwards of one hundred hours, and the fry is capable of traversing the water during this period, and is generally found swimming in comparatively wide areas. The young shell, when fully developed, retains the larval valves. It appears that there are only five or six males in one hundred individuals.

They do not miscellaneously attack all kinds of wood, but have a taste of their own, and an orderly subdivision of labour. Some species inhabit fixed wood, while others dwell only in floating wood. Each geographical district has its own *littoral* (shore-inhabiting) species; and no littoral species belonging to tropical seas has ever been found living in the northern hemisphere, or vice versa. When certain foreign species have been introduced into our waters, they have been found to be unable to survive their removal. Other species which occur in wood that has been drifted by oceanic currents may be said to be cosmopolitan, and at home in all waters, because they are always at home in the same log of wood. In such case the Teredine have their own peculiarities, but in the case of the *littoral* species, it is said to be the mode of removal in some parts of America. Yet more than one species often inhabit the same piece of wood; and the absence of due precaution in extracting the valves with their proper tubes and "pallets" (fig. 2), may account for the confusion of species found in some systematic works, and public and private collections.

The perforations of the Teredo are nearly cylindrical, perfectly circular, and frequently very tortuous, with their inferior terminations always exactly rounded. The animal, which is sometimes (in *Teredo Norvegica*) nearly two and a half feet in length, occupies the whole channel from end to end, and frequently by its efforts enlarges the hole to a diameter of an inch or more. This attachment is alone sufficient to prevent anything like a complete rotation in a continuous direction, or any rotation at the beginning; and hence the difficulty of deciding upon its precise mode of advance is much increased, especially when we remember that its course is often exceedingly tortuous, so that it would seem to turn from side to side in the most abrupt manner, and to twist itself in every possible direction. Often it suddenly turns at right angles to its original course, and after continuing a short distance, it bends again as suddenly, and returns in a direction parallel to the commencing course; and then it forms three sides of an oblong, the angles on the turn being twice perfect. From this it is manifest that its rotation must be very limited, and therefore that its valves cannot act in the manner of a centre-bit, or auger. But in the opinion of some, the most conclusive evidence that this creature does not use its valves as rasping instruments, arises from the circumstance that their anterior portions are frequently by its efforts enlarged to a diameter of an inch or more. It will, however, be more particularly discussed in connection with a description of the Pholus.

How does the Teredo dispose of the wood it excavates? This has been a puzzling question, since it must needs be disposed of, and the mode of disposal was not manifest. Sellius supposed it ate up the excavated wood, and found no other food, but it has been ascertained that its food consists of minute animalcules which are brought within its range, and drawn by one of its members (the "inhalant siphon") into the stomach. The excavated wood, however, undergoes a sort of digestion during its outward passage along the sides of the tube.

Contrary to common opinion, the Teredo abstains from ground, and perforates only sound wood, or wood sound when first attacked by it. The several species have been extracted from salted wood in the Channel Islands; from the timbers of a steamer wrecked two or three years ago on the Devonshire coast; from floating wood thrown up on various parts of our coasts; from drift-irish at Guernsey, and West-India cedar (*Cedrus odorata*) at the same island; from fishermen's stakes at Heme Bay; and the piles of Yarmouth Pier, and Ramsgate Pier, and frequently also from the Medway and the lower parts of the Thames. Such are some of the British localities, where they might be expected to occur, and which have been visited by the observers on various places. To naturalists like ourselves, neglected or rejected mass of well perforated wood (especially if mahogany or cedar) would be an acceptable present, if the Teredines themselves be at home indoors. A drifted mahogany log would be a prize, and a fisherman's stake, once extracted, might afford us high entertainment. Only a few individuals, however, can extract the mollusc perfect and with all its parts; therefore log

or stake should be sent whole and undisturbed. The rejected rubbish of other people is often the valued treasure of the observant man.

There is a curious (concentrated) chambered structure and hinder aperture in the shell of one species, as shown in fig. 1. This is the *Teredo Norvegica*.

FIG. 1.

FIG. 2.

FIG. 3.

FIG. 4.

In fig. 2, however, which represents the common ship *Teredo* in a piece of wood, the opening at *b* shows only a plain interior; although it has been lately affirmed that no species of *teredo* is without the concentrations or chamberings. In fig. 3 are seen those curious parts of the common *Teredo* called the *pellida*, while fig. 4 represents the valves which have been before alluded to as closing the animal in, and vulgarly called its head.

If we examine the delicate and fragile shell, the semi-transparent tissues, and the soft body, which is almost incapable of motion, we can hardly conceive that the *Teredo* is so mischievous a mollusc and so dreadful a ravager. When these animals have attained their adult state, they live secluded in their galleries, which, being lined with a calcareous matter secreted by the animal itself, are sufficient for them individually. This separation has rendered their mode of reproduction particularly obscure. But it has been found that they are of distinct sexes, and that, at an epoch which varies according to the species, the females emit their eggs, which are arrested within the folds of the respiratory organs. Within this odd nest the young animals are born, and remain for a certain length of time under a very different form from that which they subsequently acquire. When they are about to undergo their last metamorphosis, they leave the branches of their mother; and, fixing themselves upon the first piece of wood that presents itself, they begin to construct their galleries. From this time they are protected from all external attacks. Unless previously destroyed, they are themselves the destroyers. Hence all the remedies proposed are inefficient, or only palliative, unless applied before the animals begin to work. Recently, we find that Mr. A. de Quatrefages proposes to attain this object by dissolving in the waters which the molluscs respire a very small quantity of salt of mercury, lead, or copper. Experiments have convinced him that a twenty-millionth part of a mercurial salt thrown into the water in which myriads of these organic creatures were moving would be sufficient to render all of them motionless in the course of two hours; a two-millionth part of the same salt produces the same effect in forty minutes, and entirely deprives the water of the fertilizing power with which it had previously been highly charged. If this be a true representation, then it is highly important, and should be known to and practised by those who most suffer from the *Teredines*. It would only be necessary from time to time to cast a few handfuls of a mercurial salt, or salts of copper and lead (which are less effective), into the waters of our marine docks and wharves, to prevent their submerged wood from destruction. The fecundation would be arrested, the eggs would perish before they were developed, and the species might become exterminated from our harbours and docks in the course of two or three seasons. At present it has been found in England that a long soaking of wood in a solution of corrosive sublimate prevents it from perforation by the *Teredo*. But this is an expensive remedy upon a large scale.

We have, however, some details of these boring molluscs, known by the name of *Pholidota*, soon to bring before our readers.

MISTRESSES AND MAIDS.

WHAT is worth doing at all is worth doing well. People used to say so when we were young, and domestic morals were usually based on that principle; but the principle seems to have got worn out now, so far as home work and the conduct of what the French call the interior is concerned. There is more show than used to be, and a mighty deal less substance; a large surface of French-polish, and very little honest rubbing; a vast amount of embroidery of no use to any one, and the plain needle-work left to the slop-shops; quantities of made dishes sent in by confectioners, but no still-room niceties by the mistress and her daughters, no golden globes for marble-tops, no sumptuous revel of multi-colored fruit, no harmless deal less substance; sweet wines, nor pyramids of cakes piled up by dainty hands with the plain lawn sleeves turned trimly back; there is nothing of the dear old home life of thirty years ago, excepting, perhaps in one or two country personages

where the vicar's wife is not yet a fine lady, or in the grades set lower in the social scale. All that is done now in a ordinary middle-class house is done by servants; it is comparatively rare if the mistress gives more than the most cursory and superficial superintendence, such as ordering the dinner, of which she knows just as much as the cook pleases to allow, or seeing that the drawing-room is kept properly decorated, and that the chairs are in their most becoming position; but she is fit for any domestic company, and that the outdies everywhere are swept, and garnished, and made to sparkle upon the view. In fact all that she gives to her home arrangements is taste and a lady-like appearance. This is very delightful certainly, and quite requisite for the perfect ordering of an establishment; but there is more than this wanted; as, a dinner would be infinitely more satisfactory if made up only of creams and jellies and artificial flowers and a fine array of glittering plate. The most ethereal would feel the need of something more substantial, and the most refined men must secretly desire from their wives that steady under-current of practical supervision which their mothers were accustomed to give, and which, in their young days, was deemed one of the essentials of a woman's education.

And what is the consequence of this fine-lady drawing-room life? In the first place, most of our middle-class establishments are arranged on too grand a scale; more is appropriated to this nice housekeeping than ought to be allowed, according to the wisest calculations on the apportionment of the income; but all shows are dear; and then the thing is generally too expensively managed, even within this limit, and costs more for its show than need be. And, indeed, how can servants be expected to save the small bit here, and the small bit there, which seems so trifling at the time, but which tells so largely when accumulated at the year's end? If the mistress wishes to see that they do their ordinary duty, can it be reasonably expected that they will perform works of supererogation, and stint themselves of pleasure or perspiration, to fill the pocket of one who cannot hold her own purse-string steady? We must not look for ideal virtues from servants, and surely this would be an unbecomingly romantic notion, were it not for the necessary cost, this kind of housekeeping keeps up too great a division between mistress and maid. It is no longer one family as it used to be, when the servants were treated with affectionate consideration, and made to feel emphatically at home; when they repaid kindness by kindness, and did their work all the better for the dash of a generous attachment that mingled with it. Now they are only hirelings, without feeling for the family, and without love or care for the individual. They do just so much work as they are obliged for their own sakes, and to keep their hold, if they desire to remain; but their wages are the sole consideration that affects them, and they stay so long as they can get the most for their money. If the mistress treats them in the same spirit; as machines that are to be bought by so much money, and thrust out of doors so soon as there is the smallest flaw in the working. All the human element is gone out of the relations of mistress and servant at the present day, and we are not bettered by the omission. The mistress is no longer a mother, and the servant is no longer a child; the servants had more the character of retainers than of hirelings, and the silk gown did not sweep so gaudily past the cotton. We pay a heavy price in general for our finery.

Another consequence of this kind of housekeeping is the creation of two distinct classes of servants, neither of which is to be thought of as desirable. There is, first, the "thorough servant"—the woman who knows her business from the beginning, and does it well, too, if you allow the monetary margin she requires, and do not care for the absence of all friendly sentiment. This is the high-class servant, the very best of her order, in her place only in aristocratic households, where the service is ordered by departments, and she may take her place as chief of her ward. Such a woman as this generally disdains, as unladylike familiarity, any attempt on the part of her mistress to treat her with womanly consideration, to talk to her pleasantly of her home, or earnestly of her thoughts, or sympathizingly of her sorrows. She says she likes ladies to be ladies, and servants to be servants, and takes an insolent pride in the isolation of her position, and the difference between the classes. She is unsuitable, even by kindness, and not to be coerced by any form of severity. She is the cook who has been known to order her mistress out of the kitchen, if interfered with as to the secrets hidden away in holes and corners, or if the deep pots were more narrowly looked into than was agreeable. She discharges her mistress with an angry air, when dissatisfied with her place, and makes a speedy fortune out of kitchen stuff and broken bottles, perhaps with less lawful odds and ends than she is entitled to. This is the consequence of a mismanagement, which includes, neither doing too much, nor too little, but everything to a stranger whom it is not even sought to conciliate. When such a servant as this cannot be obtained, and the narrow income can afford neither her wages nor her perquisites, the lady must be content with a low class of servants,—one of those half-trained, unfeeling creatures, who go out for small wages, and think they can do everything without learning, but who, under careful training, would turn out sterling valuable servants; and who, indeed, are the pride of homely housekeepers, as delighted to teach a new maid as a mother is to teach a child. Ignorant of the first principles of cookery, or the very abasics of housework, they are taught servant of low wages, in a poor fine-lady house, is the most ill-placed person of our generation. Work ill done, services ill paid, less moral guidance than personal interference in the stricter families, less kindness than carelessness in the latter, the relations existing based avowedly only on work and wages, and not taught made at any friendliness of feeling, kindly sympathy of intercourse, or even wholesome and necessary teaching—the house which has inferior servants, and a do-nothing mistress, is about the ultimate of domestic discomfort. Not all the paste or gilding in the world can bridge over the chasm, or hide the ugly scars. They are visible everywhere, and form a sudden appeal to those who look beneath the surface.

Who is to blame for this removal of old landmarks, this disruption of happy bonds, this uprooting of pleasant places? We fear the blame does not rest only with one or two, nor yet with any one single circumstance of society. It is due as much to the foppishness of men as to the vanity of women, as much to the ingratitude of servants as to the heartlessness of female employers. Cause it is his in the insane desire of all people to stand higher than their fathers and mothers were content to stand, and the mad ambition to appear richer and grander than they are. Another cause is due to the unsettled

Valuable as the instincts of the sailor and farmer may be, they can tell us nothing as to these matters, and they can hardly be said to lead to the discovery of important general laws. But the empirical laws they give are suggestive to the man of science, though in themselves they may have little value, and it is certain that to lay the foundation of a science, much more is required than the unaided senses can give. Those who have leisure and opportunity for observation, and can turn to themselves not to neglect or tire of their work, can hardly do better work than to make and tabulate cross-yearly records, and for such persons Mr. Drew's little book will be found to have great value. The present differs but little from the first edition, and the chapter on the present state of practical meteorology would probably have undergone more careful revision, had the author been living, to work it up to the present time.

A GLANCE AT FOREIGN LITERATURE.

When the mind of society in general is suffering under any passing hallucination, no matter on what subject, contemporary writers naturally consider it their duty, or their province, to take a survey, if we may so express it, of the momentary mania, and to discuss its causes and effects. In pursuance of this principle, various treatises have appeared at different periods—on sorcery, for instance, in the fourteenth century, on the dancing mania a little later, and on magnetism in more modern times.

The mania of table-turning and spirit-rapping of the present day has, as a matter of course, called forth many opinions and elicited many facts, and the work of M. Louis Figner* supplies us with a history of the marvellous in the nineteenth century. He commences by the description of a Jew of the name of Léon, who sold, in 1770, magic mirrors at Paris; then he proceeds to narrate the strange history and life of Cagliostro, of Mesmer, and of *Magpie Cécile, la fille électrique*. He afterwards examines the origin and progress of table-turning in France, in America, and in England; but he treats the subject more in a historical than a critical point of view. M. Figner draws no conclusion, and although his relation is satisfactory as to its completeness, still one could have wished to find in his book some little philosophical discussion to elucidate the subject.

Passing from the supernatural to a human intelligence of the highest order, we will mention the works of the learned Leibnitz, of which a complete edition is now publishing by Count Foucher de Careil†. The first volume has just appeared, but, unfortunately, four or five years at least must elapse before the whole (20 vols.) can be published. The single volume before us contains his correspondence with Bonnet, Mélanie, Spinoza, and others, from original manuscripts. An able introduction shows the numerous errors accredited until now concerning this great philosopher, whose name even has been wrongly spelt *Leibnitz*, while countless letters prove that *Leibnitz* is the correct orthography. An ignorant heir sold all his valuable papers after the death of the philosopher of three thousand Dalres (1856). These letters are instructive, not only on philosophical and political subjects, but they delineate also the progress of ideas at the period in which he writes.

Among the many late works on Russia, the Empress Alexander and Nicholas, on the social and public character of that vast empire, will be found more interesting than the "Biography of Madame Schastliova."‡ She was born in Moscow in 1782, and descended from an ancient Muscovite family. As her father and several of her relatives held high official situations, she had an opportunity of observing personally most of the great men of the reigns of Empress Paul, Alexander, and Nicholas. The first volume contains many curious letters written in the years 1813 and 1814, and give very amusing details of the Court of Madame, Saint Andrew, Madame Reznova, Count Montalembert, and others; also of the invasion of Russia by Napoleon, and of the revolution of 1848. The second volume contains short treatises on religion in general, on old age, on resignation, and on Christianity. The authoress possessed evidently a highly-gifted mind, infused with a true spirit of charity. Literature is much indebted to M. Pallaut for his collection of these fragments.

The remarkable events which occupied the close of the last century, supply an inexhaustible source of anecdote to English and French writers; and all details on the extraordinary state of society which produced the great political convulsion called the French Revolution, are sure to be received with fresh interest. Women look so prominent a part in the great movements of 1789—1793, that Messieurs Edmond and Jules de Goncourt have been induced to write a history of the mistresses of Louis XV., as a just and necessary elucidation of the real condition of French society, and of its political bearings.† Madame de Nohe and her four sisters; Madame de Pompadour, and Madame du Barry, are the biographies here presented. The first, edited afterwards Marquis de Vasthail, was the second of the five daughters of Louis de Mailly, all of whom successively were favourites of the King. The youngest became celebrated under the name of Duchesse de Châteauroux. Marie Antoinette, the third, was the youngest of her birth, was endowed with such fascinating charms that she retained her power and influence over her royal lover up to the day of her death. One of her redeeming qualities, from which the public derived benefit, was her steady protection of the fine arts, for which she did much real. At last, losing herself in progress of the most talent. Although the character and career of Madame du Barry are well known, some anecdotes are here given which we do not remember to have met with elsewhere.

Now that Italy concentrates the attention of the whole of Europe on her future destiny, M. Albert Castelnau, of Lyons, has done us a happy service for an historical record on "The Revival or Renaissance in Italy," and embraces, of course, her most important period, the end of the fifteenth century. The author, on all main points, has kept strictly to truth, and only makes use of fiction to connect facts together in the most judicious manner. At last, leaving himself no room for taking hold of the mind—Rationalism, Mysticism, and Ecclesiastical authority. The first is represented and embodied in Machiavel; the second in Savonarola; the third is exemplified by Loyola. The heretics of the time, Zinzani, a most interesting character, he has made into a philosophical, and, in a most accepted and enthusiastic, due in a convert, after having been involved in most of the stirring events of the period. All the great names of Italy from 1491 to 1514 (and they are among the greatest in the world for crime as well as for

virtue), act a part in this drama, which we feel sure will soon be translated into English.

Monsieur Larroque, formerly a rector of the academy of Lyons, struck with the conviction that religious ideas can now only be inviolated through the medium of the reason, and that there are in all countries evident symptoms of a regeneration of Christianity, has just published a work* wherein he examines, in a very learned manner (in the first volume, consisting of more than 400 pages), the dogmas of Original Sin, of the Trinity, of the Incarnation, of the Resurrection, of the Last Judgment, &c., taking Holy Writ and the opinions of the fathers of the Church and the philosophers of old, as the basis of his argument. In the second volume he explores the books of the Old Testament, and inquires into the history of the New. The work is written throughout in a calm spirit of research, and with logical power, but the consequences drawn by the author are such, that the book was prohibited in France and published in Belgium, where, by the laws of the constitution, all religious opinions may be freely expressed.

THE SIGN OF THE PINE-TREES.

I KNOW what the forest smelt,

The forest of dark-green pines,
That are moved by the wild wind's breath,
When the cold clear starlight shines,
And the tales of the deep air-choir
Come rilling through their lines.

II.

I know, but I cannot tell,
For want of the mystic speech,
And the words ineffable,
That Wisdom cannot teach,
Even on her highest mountain
Where she sits beyond our reach.

III.

But I listen all night long
To the low eternal song,
To the melancholy song,
Burthen'd with mysteries high—
Earth-mornings set to music
On the harps of the upper sky.

IV.

I listen all night through,
And ever and ever I hear
One word that seems to me,
And two that mingle clear
Into a third low whisper:
Far off, but drawing near.

V.

I feel what the forest sings
With its veiled mystery breath:—
These thoughts—these words—these things:
Sorrow, and Love, and Death.
The mystery! the mystery!
Behold what the pine-tree saith! C. M.

LITERARY INTELLIGENCE.

Messrs. Bell & Dally have in preparation—Another book of "Amber's Tales," translated by F. Webster, with 150 illustrations by E. H. Webster, Thomas, and others; "The House of Macland," translated from the Dutch, by Thomas Keightley, M.A.; and a new poem, entitled "Circumstances," by Alfred Tennyson, the post-humous.

An interesting memoir of the great John Bunyan is about to be published by Mr. Hotten, of Piccadilly. It is a reprint of an hitherto unknown poem, written by the author, whilst confined in Bedford jail, for the support of his wife and family. Mr. Offer, well known for his researches into the literature of the period, edits it, supplying an introduction, which gives new facts concerning Bunyan's private life.

The "Illustrated Horse Doctor," by Mr. Edward Mayhew, has been a great success. An eminent French firm is in treaty with Messrs. Allen & Co., to produce a translation in their language; while the American house of Lippincott & Co. of Philadelphia, are negotiating for its production in the United States.

Mr. Bentley will shortly publish "The Researches and Discoveries made during a Residence of Seven Years in the Levant and in the Islands of Mytilene and Rhodes," by C. T. Newton, Consul at Rome; "The Autobiography of Mrs. De launay, attached to the Court of Her Majesty Queen Charlotte," edited by Lady Darnley (this work will contain many interesting records of the time, and various letters from "the men" of the day, such as Wesley, Dr. Young, and others); "The Greatest of the Past Masters," an historical memoir, by Edmund Clifford; and the "History of Rome, from its Earliest Time to the Present of its Decline," by Dr. Mommsen, translated by the Rev. W. Pat. Dickson, with an introduction by Dr. Schmitz.

Messrs. Puttick & Simpson, literary auctioneers, commence their season on November the 5th. They announce the valuable library of the late Mr. Joseph Sans, of Darlington, and first Union-street, London, to commence on that day, and to be continued on the six following days. The catalogue comprises numerous specimens of early typography, English and foreign; rare and curious tracts; some valuable works relating to the Society of Friends; manuscripts on the fine letters of Egypt, and Hebrew square and round. Lot 894 is a curious specimen of early printing, from the press of Richard Last, in 1516. It was unknown to Heber, who had not a single specimen of Last's printing in his splendid collection. Lot 1,377 is also worthy of note; it is "Lottari Liber Miserie Cordis

* Les Tables Tourmentées, de Mélanie, et les Épîtres. Histoire des Merveilles dans les temps modernes. 1 vol. 8vo. Paris. Hachette, 1860. London: Belland.

CONDUCTED BY CHARLES MACKAY.

No. 18.]

SATURDAY, NOVEMBER 3, 1860.

[PRICE 3d.]

MARRIAGE OF THE PRINCE OF WALES.

THE Prince of Wales, like the young English gentleman of a previous era, has made the grand tour. He has seen life and society; and forms of government different from that under which it is his own privilege to live. He has, in the course of a journey far more likely to be useful in forming his character, and in imbuing his mind with the genius of a progressive age than any tour of double the length in Europe, comported himself with the dignity of a prince, and with the affability of a gentleman. He has endured with good humour the rough greetings, and the rule but well-meant curiosity of millions of Republicans, whose instincts and sympathies are more monarchical than they know. He has, without set speeches or formalities, softened, if he have not removed, the remembrance of by-gone feuds and asperities; and, by one graceful act of homage at the grave of Walsington, he has made amends to the present generation of Americans for the trouble given to their forefathers by the wrong-headed King whose throne, if his life be spared, he will one day inherit. He has thus headed, more effectually than a thousand treaties could have done, the last lingering soreness of a happily ended struggle.

And as in former days the English gentleman or nobleman made the grand tour, and married;—so in the present day the thoughts of those who are interested in the life and happiness of the Prince of Wales will turn with some solicitude, if not with anxiety, to a happy marriage as the next stage in his career. The subject is one of such national importance, that every family in the kingdom is interested in it, and without the imputation of indelicacy or impertinence, may discuss its propriety, and speculate upon the more or less of liberty that his illustrious parents may be disposed to allow him in a matter which concerns them much, but which concerns the Prince and the nation far more.

It requires no very intimate knowledge of the domestic history of England for the last seventy or eighty years, to justify the assertion that the rules laid down by George III. and his advisers for the marriage of his sons were the prolific sources of so much private misery and vice, and of so much public scandal and mischief as to make the youth and early maturity of those princes a discredit to themselves and their country. If there could in our day be a revival of such a Prince of Wales as afterwards became George IV.—of such a Duke of York, of such a Duke of Cumberland, or even of such a Duke of Clarence, as were known to the fathers of this generation,—the ancient throne of Great Britain would be exposed to more formidable perils than it has encountered since it had to bear the rude shocks of Oliver Cromwell. Had a George IV., a Frederick of York, or an Ernest of Cumberland, sat on the British throne for the last two-and-twenty years, instead of the estimable lady—the model of wifehood, motherhood, and womanhood, the pattern of all the domestic virtues, who adds such grace and dignity to her high station—the storms of revolution which have left this realm unscathed amid the perturbations of all Europe, might not have passed over our heads so harmlessly. It has been fortunate for the nation that at such a time it had such a sovereign; and for the sake not only of public morality, but of public liberty, it must be the prayer of every good subject that the next inheritor of the throne, and all his royal brothers in due season, may imitate in their public and private lives the virtues of their mother and father, and, like them, set a bright and pure example to every household in the kingdom.

The experience of the past is upon record to guide us. It was the proud but silly despotism of George III. in not allowing his children to marry for affection, like happier and less conspicuous citizens, but for reasons of state, and with none but the daughters of foreign kings and potentates, that drove these princes, in the hey-day of their youth and the turbulence of their passions, into disreputable intrigues and disgraceful alliances. The temper of our time is different. The Queen's own marriage was one of affection, and the nation has reason to bless the happy result. The Queen's daughter has also married for affection, and in a way gratifying alike to her own heart, the wishes of her parents, and the policy of the nation. That the Prince of Wales should do the same at the earliest possible period, is alike the interest and the wish of the whole country. If his heart, left to its own promptings, makes choice of a Protestant princess among the few Protestant royal families of Europe, the nation will look on with affectionate approval; but it will not approve, if for dynastic or political reasons he be either compelled or persuaded to form an alliance such as that which embittered the days and impaired the usefulness of the last Prince of Wales. And why should the Prince marry a foreigner? If it pleased him to do so, it would be impertinent for any one to object; but if it pleased him in the same way to place his affections upon an English lady, worthy by her virtues to sit upon a throne, any objection, we think, would be equally impertinent and ill advised, and would most certainly not come from the people.

There are noble houses in Great Britain as ancient, as honourable, and as respectable as the major or minor royalties of the continent, an alliance with any one of which would neither tarnish the fair fame nor imperil the safety of the house of Hanover. The days are gone when the marriage of a king of England into the family of a great noble could endanger the succession, or lead to civil war. Neither kings nor nobles have such power amongst us as they had in the times when Elizabeth Woodville or Anne Boleyn was Queen-Consort; and, whatever the Garter, or Lyon Kings of Arms, the heralds, the trumpeters, the beefeaters, or other half exploded absurdities of the Herald's College may say to the contrary, it is certain, from the tone of public opinion in our age, that the great bulk of the British people of all ranks and classes would hail with pleasure the choice of the Prince if it fell on a lovely and virtuous English, Scottish, or Irish lady of birth sufficiently aristocratic to hold her own place among the nobles of her court. If it pleased the Prince of Wales to elevate such a one to be the partner of his destinies, he would commence his social life by an act which would secure him the public favour in a degree that he could never again hope to surpass, and which would follow him to the latest moment of his career. The Empress Eugénie has added more strength, as well as more grace, to the dynasty of Napoleon III. than it could have derived from any of the lumbering thrones of Germany, or from any princess or archduchess of Russia or Austria. The example is potent, and will not be without its weight when the time comes for a decision.

The Prince of Wales, as soon as he is fairly launched into the society of London, will be exposed to many dangers, many temptations, and many intrigues, which the maxims and the principles instilled into him in his own virtuous home may enable him to resist and to foil. But as his temptations will be more than common—so ought also to be his safeguards. And next to high moral and religious principle would be his happy marriage with a lady of his own choice

—whether she were of imperial, royal, or noble birth, or of British or foreign parentage. European royalty is exposed, in one day, to so many changes, and reverses, and stands in some countries in so invidious a position, that perhaps a slight infusion of aristocratic, or even democratic, blood into the ancient royalty of Great Britain might give it new vigour. At all events let public opinion bespeak for this Prince of Wales the personal liberty which was denied to the last wearer of the title—and good, not evil, will result the sooner and the more gracefully it is accorded.

THE FATE OF TURKEY.

IF we are found constantly adverting to those political considerations which affect more immediately the East of Europe, it is because the present internal condition of Turkey, is but little understood in England—a fact which will not prevent the British public from holding the most decided opinions as to the nature of the policy which should be pursued in that empire should the Eastern question once more assume that prominence which it doubtless will, in the course of those political combinations which the leading diplomatists of Europe are at this moment evolving. The fact that we have an embassy at Constantinople and a great number of diplomatic agents scattered throughout Turkey; that we have spent an incredible amount of blood and treasure in maintaining its independence; and that our attention for some years past has been turned in that direction, cannot, unfortunately, convince any well-informed writer or observer, that either the Government or the people of England are in a condition to decide upon the policy which it will be the interest of this country to adopt with reference to the fate of that empire. And if perchance the Government are in possession of information which should suggest the right course to be pursued, the House of Commons and the country, in the absence of that knowledge, may be known to hold a different opinion. And as we can scarcely venture to hope for such an amount of patriotism on the part of any Government as should induce it to follow the right policy in lieu of one which is popular, it is of the utmost importance that the public generally should be as well informed as the Government.

With regard to the present internal condition and political sentiments of one part of Turkey, at all events we may venture to assert confidently that we are as well informed as the Government. It is not a little remarkable that we have never had any political agent of any description in that province in which, when the great Eastern explosion takes place, the ruin will inevitably be lighted.

Our Government is, at this moment, as profoundly ignorant of the state of Montenegro as if that state was situated between Kamaskia and Japan; and yet Montenegro is the centre of those intrigues which are destined, unless we take measures to counteract them, to render all our exertions in behalf of Turkey valueless. Because we have never recognized the independence of that state; because it has some years been an open ulcer upon the side of Turkey; because we have disapproved of the bellicose propensities of its inhabitants, and their continual inroads upon their traditional enemies, we have thought it necessary to show our displeasure by an almost entire abstention from any intercourse with them. The consequence is, that Montenegro is entirely in the hands of French and Russian agents, who disseminate lies with reference to England unconcealedly; who supply the Montenegrins with arms, ammunition, and money unreservedly, and who instigate them to overt acts of aggression upon the neighbouring provinces of Turkey unrestrained by any fear of discovery. The only foreigner who has been resident in the capital of Montenegro, for some months past, is a Frenchman. His influence, in conjunction with the able diplomacy of a colleague at Scutari on the Montenegrin frontier, has completely eclipsed that formerly wielded by the Russian consul, who used to be considered, practically, the administrator of the country. Indeed, it is a remarkable fact that, throughout the East, within the last few years, French influence has gradually supplanted that of the Czar, who seems now to be contented to follow in the wake of the more enterprising diplomacy of the Tuilleries.

The importance of our imperial ally places upon this obscure mountain district may be gathered from the circumstance of his having written an autograph letter to Nicholas, the present youthful prince, concluding with him upon the recent assassination of his uncle Danilo, while, both in St. Petersburg and in Paris, the Montenegrin deputation charged with a mission to report that event, were honoured with personal interviews with the Emperors of France and Russia. It need scarcely be remarked that no such deputation ever visited London, and that our Government took no official cognizance of the death of the late prince. That event, nevertheless, was one of some importance to this country, politically. It placed the supreme power in the hands of Mirko, a brother of Danilo, and the father of the present prince, who is too young and incapable to possess any influence. Mirko is a man devoted to France, and who is said to have received large sums for his co-operation in the designs which are being rapidly elaborated, with the view to the proximate dismemberment of the Turkish empire. Whether this be so or not,

it is certain that constant disturbances take place on the Montenegrin frontier, the result of unprovoked inroads by the Montenegrins—whose delight and occupation is generally warfare—into the neighbouring Turkish province of Herzegovina, where the Christian population is ever ready to respond to the agitations of their turbulent co-religionists. To repress these rising, active measures on the part of the Turkish troops quartered in the district are necessary, and are called by the French and Russian agents, who send reports of them to the continental papers, "new persecutions on the part of the Turkish Government of their Christian subjects." We have recently had a specimen of one of these accounts of an *énée* at a place called Gasko, where the Christian population rose, without any provocation, against the Turks, and were with difficulty restrained from a wholesale massacre. Had such a catastrophe taken place, the incompetency of the Turkish Government to preserve order would have been loudly proclaimed throughout Europe. As the rising was repressed, a representative in the contrary sense was made, and the whole affair, in which very few lives were lost, was converted into another case of persecution, with numerous embellishments, and invocations of horrors which never occurred. The same influences, however, carefully conceal the fact that the noses and ears of Turks are the trophies of Montenegrin warfare, mutilated specimens of which may be seen in the Turkish towns in the neighbourhood. The effect of these atrocious reports upon the European mind is to confirm the impression already prevalent among those who have no personal acquaintance with Turkey, that it will be impossible much longer to maintain that empire, and that we engaged in a gigantic blunder when we undertook the Crimean war, and sacrificed millions of money and the best blood of England in the attempt to accomplish an impossible object. Either those who involved us in that war were guilty of an unpardonable crime of ignorance and stupidity towards the country, when they compromised it in defence of Turkey, or the policy which induced them to fight in its behalf still holds good, and Turkey is still capable of an independent existence. Those who are familiar with Turkey do not differ in opinion upon the latter point.

The only danger to Turkish independence lies in the machinations of those who profess to be its friends, and in the corruption of one or two men who, at present, hold the reins of government. With Riza Pasha omnipotent at Constantinople, it is impossible to expect the inauguration of those measures of reform which would at once satisfy the Christians, and deprive the enemies of Turkey of the pretexts which a weak Government now affords them. But to maintain that *some* of our statesmen are base and incompetent, and the system of government *some* have imperfectly understood, and the empire is incapable of existence, is to make an inference which might have been drawn with tenfold greater force prior to the late war. Since that period the internal condition of Turkey, both financially and politically, has been rapidly improving. The social state of the Christian population has been, in all important respects, largely ameliorated, while the name of England ranks highest among the nations of the world. We may, at least, congratulate ourselves upon the fact, about which there is no dispute, that our influence is all powerful with the Turkish people, if not with the Government, and that an enthusiasm exists with respect to England, which only those who have recently travelled in the country can thoroughly appreciate. We owe our present prestige throughout the empire to those Turkish corps which were formed during the war, and commanded by English officers. Every private who served in the Turkish contingent, every Bashi Bazar who returned to his native village with his pocket full of English gold, has been a missionary proclaiming the bounty and honesty of England; and an army of 300,000 men, of the best material which Europe can afford for warlike purposes, would enlist under an English standard in Turkey to-morrow.

The one question which is propounded incessantly to every Englishman travelling in Turkey is, "Will England raise a Turkish army in the event of another Eastern war?" and the answer of the Englishman who knows his countrymen will probably be—"The British public will never tolerate another Eastern war. They are profoundly ignorant of the merits of Turkish soldiers; they know nothing of their wonderful endurance, of their discipline, of their discipline, or of their bravery in the field. They forget that never once, on the Danube or in Circassia, did they meet the Russians without coming off victorious. They only remember that a few raw recruits evaded some earth-works in the Crimea, which, under the circumstances, their own soldiers could never have held; and they are now ready to sacrifice all the advantages which were gained by the war, because they believe the reports of the emissaries of Russia and France, and consider that a partition of Turkey, which was unjust then, will be just now, and that we are likely to obtain a larger share of the spoil, from the combined good nature of Louis Napoleon and the Czar, than would have fallen to our lot had we accepted the proposals of the Emperor Nicholas." When, in the course of next spring, the Christian populations of Bosnia and Herzegovina, supplied with arms by France and Russia, and co-operated with by Prince Michael of Servia on one side and by Mirko of Montenegro on the other, rise in open rebellion against the Turkish Government, there will be an outcry in

England that Turkey is falling to pieces. And although, if the Serai-kiate is left to its own devices, there is no doubt that any such rebellion would be quashed in a month, the sympathies of Englishmen will be enlisted in behalf of the Christian populations, and we shall play the game of France by weakening still more the supreme authority, and precipitating the fall of an empire whose existence is essential to our Eastern interests, and whose alliance would be more powerful than any other in Europe, because it would be honest and subservient, and because its armies would be under the absolute control of the Government of this country. Let Turkey see thoroughly well that her existence depends upon the will of England, and can only be secured by her compliance with certain conditions imposed by us, and her armies become English armies, and her system of administration conformable with English views, without either the responsibilities or the expense of an additional possession. We should thus wield to our own advantage, and to the benefit of the whole population, the vast material resources of an empire for which we have spent so much, and justify, by an enlightened statesmanlike policy, a war which, if followed by any other result, becomes an act of stupendous incapacity.

WANTED; A NEW GOVERNOR-GENERAL FOR CANADA.

SIR EDMUND HEAD, it is announced in the journals, has left Canada for England, and he is not, we are informed, to return to the seat of his government. A correspondent, writing from Quebec, says:—

"There is considerable speculation on the Governor's successor. It is thought the experience of the Duke of Newcastle will greatly influence the appointment. Rumour has it that 'he has said no second-rate man must be sent to Canada.' If he has said this, or entertains the opinion which could give rise to the expression, his visit has not been barren of a wholesome conviction. Canada wants not only an able man for her governor, but one of accredited standing and position. He should not only have talent, but station. The country is in a state of transition. The union, as now existing, cannot long continue. A consolidation of all the provinces under a vice-royalty is the nearest goal of England's retention of these dependencies, and the duke may, perhaps, have been sufficient to convince him of the fact. I by no means express a singular opinion in saying that it is very doubtful if the Prince's visit has added one hour to the continuance of British connection. Not that I wish you to suppose we are on the eve of rebellion, or that we desire a separation; but what I mean is, that men feel unsettled in their political existence,—they feel as men without a chart, and the Anglo-Saxon element feels itself unduly depressed, and is fast ripening to the assertion of supremacy. It is this element that the duke has not thought it worth his while to conciliate, and it will, you may depend, sooner or later work out its own vindication."

"I have just returned from a flying visit to Upper Canada, after a year's absence, and I can assure you that the antagonism of the two Provinces is assuming, in the west, an aspect that renders a provocation of the present union an impossibility. Representation by population might, two years ago, have appeased the hostility; now nothing less than a disruption of the legislative union will suffice. The elections of next year—the life-period of the present parliament—will all turn, in the Upper Province, upon the question of a new state; and, I regret to add, in a very large proportion of the constituencies, upon a pledge of opposition to the present ministry. In this latter, it must be confessed, the country demands a change; and it is but too certain that the present house does not represent the country. The mischief is that we have no better men, but as these may be, to succeed. It is unfortunate, too, that corrupt as the house undoubtedly is, the constituencies are little better. Political demoralization is all-pervading,—political immorality a subject for a jest."

We understand further, that the Orangemen of Lambton County, at a meeting held at Watford, Canada West, passed a series of resolutions, declaring their long-continued attachment to the Sovereign and the Protestant religion; their opinion that the Roman Catholics, being sworn to maintain the supremacy of a foreign potentate, cannot be loyal subjects; their deep regret at the favour shown to Roman Catholics, which has caused men of high position, who were once the avowed adherents of Orange societies now to join them; their disapproval of the conduct of the Duke of Newcastle as the chief adviser of the Prince of Wales in his late visit to Canada; and their opinion that it is no longer reasonable to count on their support for the Imperial Government. As a consequence, they request "the Grand Lodge to revise the Orange obligation at the earliest opportunity, and strike out those portions which refer to British rule in those provinces." These feelings are shared by other Orangemen, who look on themselves as the leaders and masters in the Upper Province.

Canada, then, is in a critical position. The long-cherished disputes between races and creeds, which a rapidly-increasing prosperity might have lessened, have lately been exacerbated by two or three mischances. Last year the harvest was not good. The Grand Trunk Railway is not a success, and has fallen into difficulties. A very bad feeling was excited by the conduct of the home Government in regard to the Galway mail contract, which has been to the Canadians a source both of disappointment and loss. The New Governor-General, then, will commence his functions surrounded by many difficulties, and he ought to be a man of energy, yet prudent and conciliatory. Canada should have a voice in the matter. It desires a first-rate man

for its chief; a man of high rank and a man of ability. Of late it has been accustomed to such men. Lord Durham, Lord Sydenham, Lord Metcalfe, and Lord Elgin, some of the immediate predecessors of Sir Edmund Head, were equally distinguished by ability and by rank.

The Canadians would, no doubt, like a Prince of the Blood for their Viceroy, with a federal union of all the provinces; but at present there are not the means of gratifying their wishes. The next best thing is for the ministry to select amongst the nobility that man who, by his rank, would be most likely to conciliate the Canadians, and, by his abilities, would be best adapted to prepare the way for the union, as the best method to secure both the complete self-government of all the provinces and the continuance of the connection with the mother country. It is not for us to put individuals forward; but there are among our nobility men of high rank, of ample fortune or large expectations, of great talents, and with considerable knowledge of Canada and the adjacent countries, who would be at once acceptable to the Canadians, and likely, by their moderation and good sense, to promote the great objects in view. The place is a great one; and a great man is required to fill it.

THE PEACE LEAGUE.

AMID the rumours of wars which reach us from the Continent we are glad to have to chronicle the addition of a new and not insignificant member to the Peace League. The precept to insure peace by preparing for war has too long served as a cloak for designs of spoliation and oppression. At length it is reverting to its original meaning, and we were last week enabled to add Belgium to Switzerland and England, the two nations which were hitherto distinguished by their resolute attitude of self-defence. The address by which we learn the existence of a Belgian Committee of National Defence is worthy of the sons of the stalwart burghers who handled the sword and crossbow as deftly as the shuttle, and who were among the first in the struggle for freedom, as well as the foremost in the mechanical arts. We owed them of old more than one lesson, and they have profited in turn by those we have given them of late. Belgium is the only country in Europe where the Constitutional system imported from England has really flourished. The address to which we have alluded is more than a document worthy of perusal, it is a state-paper of the highest value. Though issued by a committee of private individuals, the Minister of the Interior, by receiving, has adopted it. It naturally begins by explaining the object of the Association, the organizing a force for national defence in such a manner as, without impairing its efficacy, should cause no embarrassment to the Government. It is under cover of the liberty of association, which the Belgians enjoy as completely as we do ourselves, that they prepare to resist the possible attack of an imperious neighbour, who not long since endeavoured, by menace, to deter their government from fortifying Antwerp. This time he would have to accuse, not their rulers, but the people themselves of distrust; and whatever displeasure he may feel, he is too wise to manifest it in such a case. The address then proceeds to expose the causes which render such preparation indispensable; the decay of public law; the neglect of those diplomatic formalities which from the earliest ages have always been practised by barbarous as well as civilized nations previous to the outbreak of hostilities; the facilities which railroads and steam-vessels afford for the sudden movement of large bodies of troops, so that brief space intervenes between the declaration of war (where this old-fashioned formality is still observed) and the irruption of the enemy's forces.

Under such circumstances it is needless to be always ready to avert the possible blow. As in Syria the Druse and Maronites follow the plough with their muskets slung over their backs; so in Europe the merchant and handicraftsmen who have freedom to lose, must always have arms within reach to defend it. So strangely do barbarism and the most refined civilization present points of resemblance! Separated by no natural frontiers from the most aggressive of nations, and remembering that their country is the secular battle-field of Europe, the Flemings are perhaps more alive to the imminence of the danger than other continental nations. They have also more to lose,—the freedom which their fathers so sturdily asserted, and which they have secured,—the wealth which their modern industry, favoured by this freedom, has accumulated.

The Volunteer movement is only commencing in Belgium. It is as yet confined to a few communes, and there are but 30,000 men enrolled. This is a goodly number, larger in proportion to the population canvassed than most of our Volunteer districts can show, but far below the necessities of the case, or the aspirations of the committee. They demand and hope to obtain half a million of recruits.

The day when the wish of the committee is realized, Belgium will be independent of all treaties of neutralization, though we may hope that events will not force it out of its present happy position of a non-warring power. The address concludes with a practical suggestion, accompanied by some valuable information on the subject of small-arms. It recommends to the Minister the adoption of men-

sures to determine the comparative values of those used in different countries, so that the best possible weapon may be secured for the best possible cause.

We have all remarked the individual gain which accrues from the healthy exercise of the drill. In Fleet-street or Cheapside the Volunteer may be distinguished by his gait. The days which he gives to his country will add years to his life. The bent back is straightened, the narrowed chest expanded, while the lungs recover the free play of nature. The moral health is not less benefited than the physical. There is more than a fancied connection between an upright walk and upright thoughts, between crooked bodies and crooked ways, between the sane body and the sane mind. The leaders of the Volunteer movement in Belgium have published a nobler protest against lawless ambitions than any statesman of the present day has penned. May they go on and prosper!

THE NEW ZEALAND QUESTION.

MOST of us have set ourselves the task, at times, of investigating moral problems; and most of us have been brought to the conviction that such exercise of the mind is beset with extraordinary difficulties. Given, any one moral topic as the theme, it is astonishing how wide apart may be the limits of the difference of opinion in regard to it. Nevertheless, some sort of resultant to moral problems there must be, or no standard of right and wrong could subsist; society would disintegrate into its elements; government would be impossible.

Many of the solved social problems of the age—so-called—are not really solved at all. Morality have reasoned about them, legislators have debated, and warriors fought about them; until, reasoning, debate, and war being found of no avail, people have at last, for sheer peace and quietness' sake, adopted some provisional issue, and recognised some *status quo*—the latter mistaken for a true moral solution.

Now, a *status quo* to which one has become accustomed, a condition which embodies tenets of agreement sufficient for a specific case, may, if it be accepted as a pure moral deduction, conduce to evil, and bring trouble. Contemplate, for example, the much-vexed question of the moral relationship subsisting between a people and the land they dwell upon. Here, in Europe, however wide be the differences of opinion relative to this title to land, contemplating it under the aspect of a question of mere justice, people have long since agreed to accept a prescriptive issue. We have agreed that the mere circumstance of birth in any particular country, or of belonging to any one particular race, shall be held to give no title to the proprietorship of land. We all have agreed to accept the authority of precedent, title-deeds, possession, and other prescriptive conditions, without scrutinizing first principles and debating moral rights. For the present condition of Europe this basis of agreement is well. No one suffers ill from this arrangement; on the contrary, it in many ways conduces to social tranquillity, and subverts national progress. But there is all the difference in the world between the acceptance of a practical resultant for peace and quietness' sake, by common consent, and the recognition of it as a moral deduction.

These considerations are forced upon us by reflecting upon the lamentable troubles now subsisting between this Government and the Maori tribes. If the past history of British relations with this interesting people be scrutinized, it will be found to have embodied a new sentiment, as between a powerful invading, and a weak aboriginal race. The new sentiment consisted in the recognition that an aboriginal race had some sort of interest in the regions they were found occupying. Confused, and uncertain though the ethics of the land question be when regarded in the abstract, few minds, if any, will refuse assent to the limited proposition that the Maoris, whom we, as invading strangers came amongst, really ought to have some sort of interest in the land of their occupation. With this provisional deduction, unfortunately our Government was not content. Actuated by good will—as we are ready to acknowledge—to the aboriginal tribes, the British Colonial Government committed a great error; that of mistaking a provisional issue, a convention, for a moral principle of abstract justice. The British Government chose to assume the New-Zealanders to have acquired notions of landed property exactly similar to our own. This was absurd. The very idea of a landed proprietorship must needs be foreign to any save an agricultural or a hunting people. The Maoris were neither. When therefore our Government decreed in the treaty of Waitangi that the invaders would acquire no land in New Zealand, save by purchase from the actual proprietors of it, the conclusion must have been evident to any comprehension, save the most narrow and technical, that out of such a decree troubles some day must arise.

The Colonial Government never, in the fullest exercise of their imagination, assumed the existence of Maori parchment deeds of succession and inheritance—of Maori hereditary visitations, and smugly other paraphernalia of land inheritance as subsisting amongst ourselves. They were content, as under the circumstances they must needs have been, with very slender pretensions. This being so, the

first native to treat was the first to sell. Others followed, protesting they had as much right to the land as he; and thus the elements of dispute were never stilled. The non-success of our self-imposed territorial arrangements with the aborigines of New Zealand opens the question of the moral responsibilities that should subsist between a civilized and invading, and a savage invaded or conquered race. Looking at the condition of the Maoris when Englishmen first came amongst them, we believe that not policy alone, but abstract justice, so far as one can understand abstract justice, would have dictated the claim on the part of the invaders to the fee-simple of the entire land. Considering the benefits we gave; considering that before the seaborne adventurers landed on the shores of the British of the South not one mammal quadruped existed there besides the kiore or native rat; considering that fern roots were the staple food of the aboriginal race—supplemented by baked man's flesh on holidays as a relish—it really does not seem unreasonable that the donors of pigs and poultry, beavers, sheep, corn, and potatoes, should have invested themselves with the fee-simple of the land.

To us this appears plain justice; whilst, regarded as a policy, it probably would have obviated many, if not most of the causes of irritating contests in which the British and Maoris have found themselves engaged. It was sheer folly to have recognized, at the Antipodes, the existence of a territorial conflict identical with our own; a condition satisfactory enough in Europe, for the simple reason that they before the seaborne adventurers landed on the shores of the British of the South not one mammal quadruped existed there besides the kiore or native rat; considering that fern roots were the staple food of the aboriginal race—supplemented by baked man's flesh on holidays as a relish—it really does not seem unreasonable that the donors of pigs and poultry, beavers, sheep, corn, and potatoes, should have invested themselves with the fee-simple of the land.

That a population loss, at the time in question, than eighty thousand should alone hold and possess a fertile region of ninety millions of acres—a region about the size of the British Islands—can on no grounds be defended. The position is untenable if argued on the basis of abstract justice; it fails if argued on the lower grounds of policy and mutual advantage. Moreover, despite the pretensions sympathy for the natives and their interests, set forth in the dogma of "New Zealand for the Maoris," the dogma admitted of contravention. It was not difficult to set up the plea of holding lands in trust, for the benefit of natives present or to come. To what extent this had been done at periods antecedent to 1845, when New Zealand became a formal dependency of the British crown, blue-books painfully reveal.

For our part we care not to ponder over-much on the seeming destiny of certain aboriginal races. It seems to be decreed that the Maoris, like the Red Indians, shall soon die out. One's sympathies must be favourable to a race so highly-endowed as the Maoris. Intellectual, brave, chivalrous as the New-Zealanders are, no man of proper feeling can look upon their rapid degeneration—their withering from the land which bore them—without regret. We would stay the progress of those off-recurring contests between them and us. To that end we feel assured the Colonial Government would perform an act very much to the advantage of both parties, were they to formally appropriate, without delay, the lands of New Zealand to the British Crown.

SMOKING IN RAILWAY CARRIAGES.

IT appears, from an announcement made by the South-Eastern Railway Company, that in consequence of numerous complaints made by passengers against the selfish and ungentlemanly habit of smoking in the carriages, the directors have determined "to stop the practice." We are certain that the directors have in this respect somewhat over-estimated their power; and that they will neither stop nor diminish the evil, unless they open their purse-strings to adopt a real remedy. They confine themselves, at present, to an appeal to the public—a merely sentimental appeal which will have no effect. The state that the regulations prohibiting smoking were made to secure the general comfort and convenience of the passengers, and that they cannot but think that those who disregard the rules are not aware of the annoyance they inflict on others. Simple-minded directors! What does it signify to a smoker if he annoy a non-smoker? Does not the smoker believe that he who does not smoke is in the minority, and must yield to the majority? It is in vain that the directors, anxious merely to save money, invite the co-operation of the passengers in discountenancing the practice. But how are passengers to do it? Is one man to waste his time and ruffle his patience

in disputing with three or perhaps half a dozen strangers, who will certainly think him a "snob," or a "snuff," or give him some other slang designation, equally ungentlemanly and contemptuous, because he presumes to be more virtuous or more decent than the rest of the world! The directors deprecate the necessity of resorting to any other course than this quiet appeal to the good feeling of smokers, which the smokers will laugh to scorn, and blaze away so vehemently as ever. They may be told that by persisting in their selfish enjoyment they will render any station-master, guard, porter, or other officer, coming at, or permitting their indulgence, subject to dismissal. But these are mere words, and signify nothing. What the directors have to do, to render justice to the travelling community—smokers as well as non-smokers,—is to regulate a practice which they cannot abolish, and to build carriages for the convenience of those to whom indulgence in tobacco has become a necessity of existence.

It appears that this view of the subject has fallen under the cognizance of the directors of the South-Western, as well as of other lines, but that the expense of the improvement has frightened them from doing what is required. The sum of from twenty to twenty-five thousand pounds would be requisite, according to the statement made to us, to build a sufficient number of smoking-carriages on any of the great lines of railway leading out of London; but why should such an expenditure as this prevent any body of directors from doing what is right? People in England are not only more business-like, but more pleasure-loving; and if a person detests tobacco-smoke, it is just possible he will stay at home, instead of making a pleasure tour, if he is likely to be annoyed by the filthy smoke of a "gout," who persists in polluting the confined atmosphere of a railway carriage with the fumes of his cigar—which may be of tobacco, but which may also happen to be of cabbage,—and in which practice he may be left untroubled by the guard or other official, blinded by a shilling or half a crown. The directors should consider this, and either enforce their laws on behalf of the ladies and the non-smoking gentlemen—or alter them; and if neither of these courses be advisable, conform as best they can to the circumstances. The thing to be done is to build smoking-carriages. To this alternative railway directors must come at last, and the sooner they make up their minds to it the better. If £20,000 be too much for them, there is no necessity to spend the money all at once. Railway carriages, like everything else in this world, wear out; and whenever the directors are compelled to build a new carriage, let it be one for smokers; and they will thus throw what might be an extraordinary, into the category of an ordinary expenditure, and do by degrees what is inexpedient or inconvenient to do all at once. But sentimental appeals to the good feelings of smokers are all thrown away, and are of no more efficacy than bottled moonshine.

RURAL ECONOMICS.

THE BETTER KNOWING, THE WORSE PURSUING.

THE way in which our English landowners regard the lessons afforded by the experience of others is something wonderful; or rather it appears wonderful, if we regard them simply as rational owners of property. But if we investigate the subject, we find them beset by prejudices which prevent them from acquiring a knowledge of good management, or from applying that knowledge where circumstances have forced its acquisition upon them. It is known to most agriculturists that in Scotland, where a long lease is invariably given and required by landlord and tenant of a farm, and both parties regard the transaction of letting and hiring a farm as a purely business matter, rents are higher, farmers' profits greater and more secure, and husbandry more advanced than in England, where yearly tenancies, sub-servient tenants, and patronizing landlords, are regarded as the ordinary incidents of landed property. In Scotland the climate is inferior to most parts of England, the soil is more moderate, and the market facilities are not so great, yet confessedly, north of Tweed, husbandry, regarded simply on commercial principles, is a safer and more advanced business than it is in England. Nor is there any difficulty in seeing the causes which give the Scotch farmer these advantages. There the contractor for a farm is a deliberate business, necessarily the subject of calm calculation on the part of the tenant, and due inquiry and consideration on the part of the landlord. The one party knows that he must make a large and immediate outlay, with the hope of receiving it back with a sufficient profit during the currency of his lease. The other knows that the security of his rental and the improvement of his land for the next ninety or twenty years must depend on the prudence and competency and agricultural skill of his tenant. Hence caution is exercised on both sides. And one very material advantage the security afforded by his lease gives to the Scotch farmer, is the facility with which he can obtain loans of capital from bankers and others during the commencement of his lease, and while he requires the use of all his available capital to bring the farm into a proper state of cultivation. When this has once been done, the farmer's course is comparatively easy, and the advances he received during his primary struggles are repaid. The landowners of Scotland, too, are more alive to the necessity of making permanent improvements than are the English landlords; those who by the greater part of Scotch landowners have been made by tenants, or by landlords under engagements entered into with tenants at the commencement of their leases. In short, the system of leases is the corner-stone of Scotch husbandry. Now these things are not unknown, or need not be unknown to English landowners. They travel in Scotland, they visit their Scotch friends, and accompany them, and make of them good periodically to shoot in the Scotch highlands; and although the exclusiveness of the class is proverbial, yet even an English aristocrat cannot in these

days go into Scotland without seeing and hearing something of the differences between the positions of Scotch and English farmers, and the advantages enjoyed by the former. Yet what practical conclusions do our landowners derive from such knowledge? None, literally none.

Here, for instance, the same and identical conclusion drawn by Sir John Pakington, from his not unimportant observations made during a visit to Scotland. At the Worcester Agricultural Meeting, after referring to the role of the society against the introduction of political topics, declared his intention of following Mr. Disraeli's "wise" example in Buckinghamshire, of addressing an agricultural meeting without touching on politics. He thought "their object at these meetings should be to disseminate agricultural knowledge." With that view Sir John gave an account of his Scotch visit. He said:—

"Within the last few days he had travelled through that celebrated agricultural district between the rivers Forth and Tweed, where he saw most splendid farms, with fields large and ledges small, where he could count the housesteads, because there were few trees to intercept the view; and where every housestead had its steam-engine chimney. The crops there were magnificent; and the rents were high because the farming was profitable. Farming there was profitable because leases were long. Every farm was farmed with sufficient capital, and the tenant had no fear or hesitation in investing his capital in the soil, because he had the security of a lease. What was the result? Such rents were paid as were typical of the demand of this country; and it was a common thing that the rents there should be so high that he was afraid to mention them to a Worcestershire farmer. But he (Sir John) was told that it was common to pay corn-rents there, and that the rent of a farm, per acre, in that district was from 10s. to 12s. and sometimes three. Sometimes a farmer paid £1,000, £2,000, and even £3,000 a year rent, and had a handsome profit left for himself afterwards."

This is truly, as Sir John Pakington admitted, "a fine picture of farming;" and what is the natural conclusion to which it would lead the mind of an unprejudiced owner of land? What would any reasonable Worcestershire landlord be expected to say? He would naturally say—"I will ascertain that my tenants have sufficient capital to invest in improved cultivation, and, having done so, I will grant them long leases; I will aid them to adopt the efficiency and economy the steam-engine affords to many operations of husbandry, by remodelling their farm-buildings and housesteads; that the use of steam-engines may be possible; and, having done these things, I may fairly expect to receive an equivalent increase of rent." There is scarcely a farmer in the county of Worcester who would not have readily agreed in such conclusions; who would not have said, "That is something like business;" "Now the squire has travelled to some purpose;" or the like. But, in truth, Sir John was not talking to the farmers. He had the landlords of Worcestershire in his mind's eye, and any such practical conclusions from his own premises would have been deemed by them rank heresy. He therefore adverted to a non-essential portion of his "fine picture of farming" in Scotland, wherein he assumed it to contrast unfavourably with Worcestershire farms, and dwelt on that, saying:—

"Now, this was a fine picture of farming; but he must confess that he should be sorry, in the county of Worcester, to see all this fine picture of husbandry spreading and their rich apple-orchards filled, and their fields well sown and fruitful as in the district he had named, for he saw there many high steam-engines, but he looked in vain for a lofty tree. They might do a good deal in the way of improvement before they might be expected to follow the example which had been set them in Scotland to a certain extent."

He said they must admit "that the general character of Worcestershire farming" was not good; "that they did not stand high in agriculture; and that their first object should be to communicate knowledge to each other."

Now, why does Worcestershire not stand high in agriculture? The soil of the county is for the most part fertile, and the climate is moderate, and generally easy to work. The climate is generally far more genial than any part of Scotland. The county is within easy reach of some of our most populous manufacturing districts, where the best markets for all agricultural produce are to be found. Coal is cheap, and everything invites the Worcestershire farmer to use the steam-engine, save that which the Scotch farmer enjoys, a long lease. Nobody would suggest the stripping Worcestershire of her orchards, or even her oaks and elms; but the fields might be enlarged with advantage, and much of the timber usefully removed. The elm may be very beautiful, or the wide-spreading oak very magnificent in a landscape's eye, but what will the farmers get when these fine ornaments of nature stand in the way and turnip-fields are wanted? Are none of the soil fields and straggling fences of Worcestershire maintained, of "malice aforethought," to preserve game? We hesitate not to say that, without interfering with general landscape or the orchards, such a removal of hedgerow timber and broken fences might be made in Worcestershire, and the result would be to leave rents as high as those paid for land in Scotland, while the farmers would become far more independent and prosperous than they are at present. At the same meeting Sir Thomas Winnington said he had lately "visited the counties of Norfolk and Suffolk. There, too, he saw tall chimneys intermingled with rural scenery, and there, too, he saw steam-engines used."

There, too, Sir Thomas might have said, he found leases forming the basis, and the sole basis, of improved husbandry. But, somehow or other, the landlords at these agricultural meetings always omit the most essential point. They seem to require the bricks to be made without straw; they preach improvement, yet ignore the only means by which it can be obtained. Yet Sir John Pakington shows it is not ignorance! What is it?

NON-ESTIMABLE FABRIC.—In consequence of the number of accidents which occur by the "hotter" light from ladies' dresses, a bill for an inquiry was directed by Her Majesty to be made, for the purpose of ascertaining if some means could be devised for rendering the materials of which such dresses are generally composed less inflammable. This inquiry was intrusted to Mr. Fret. Vermaun, F.R.S., and also, Alphonse Oppenheim, F.R.S., and an account of their investigations has been published in a pamphlet by Messrs. Tröbner & Co. of Paternoster-row. They "advocate the adoption of sulphate of ammonia and of tincture of soda in manufactures of light fabrics and in laundries." They declare that the general use of these salts will greatly reduce the risk of fire, and that, through the use of these salts, prepared by the manufacturing purposes and domestic use, can now be procured in various parts of London.

immediate pursuits. He commended the study of science and history, and the pursuit of such novels as those of Scott and Bulwer, as a relief from more recumbent subjects; and in conclusion he expressed a hope, that no exertion or co-operation would be wanting on the part of the people of Leeds to give ample effect to the scheme which had been so nobly conceived for the enlargement of their institution. On the following day, the corporation of Leeds entertained the Premier to luncheon, and presented him with an address of congratulation, to which he replied at some length, expressing incidentally a hope that the changes now in progress in Southern Europe might lead to the establishment of a political system in Italy as conducive to the happiness and prosperity of the Italians as, unfortunately, some of the governments which have hitherto existed in that country have contributed to their unhappiness and their misery.

On the evening of the same day he presided at the annual meeting of the Leeds Ragged School Society and Sheshale Brigade, and delivered a speech, in which he showed such a lively appreciation of the value and importance of these institutions, as to inspire the hope that their claims upon government recognition will meet with powerful support in the coming session of Parliament.

Previously to the *soirée* at Leeds, a meeting was held, of delegates from the Chambers of Commerce, in the chief centres of business in Yorkshire, to make arrangements for an interview with Lord Palmerston on the subject of the bankruptcy and insolvency laws. The meeting was addressed by Mr. Morley of London, who contends that the present Bankruptcy Court, instead of being, to use a definition of Lord Eldon, a court for the distribution of assets among creditors, is a court for the distribution of assets among official assignees and other functionaries. The opinions expressed by Mr. Morley were enthusiastically approved of, and a resolution in conformity with them was adopted for presentation to Lord Palmerston; a high eulogium was at the same time passed upon Sir Richard Bell and Sir Fitzroy Kelly, for their entire sympathies with the legitimate claims of mercantile men for reform in bankruptcy. Lord Palmerston promised that a measure similar to the Bill of last Session would be brought before Parliament.

Lord Palmerston's address at the Leeds Soirée, was followed by one on the same subject, delivered by Lord Stanley, at Warrington, on Saturday last, at a public dinner, on the occasion of a change in the organisation of the Mechanics' Institute of that place. Lord Stanley is of opinion that one of the main reasons why the children of the working classes leave school early, is the natural and honourable desire they have to get their own living as soon as they can. For persons who act on such motives, Mechanics' Institutions supply the means of further instruction. He felt convinced, from what had fallen under his notice as Chairman of the Kirkcaldy Quarter Sessions, that ignorance is a fruitful source of crime; and that instruction in every shape tends to improve the morality of the population. He therefore hoped that Mechanics' Institutions would become as successful in all parts of the country as they already are in Manchester, Leeds, and Liverpool.

In consequence of the hostility to Mr. Traut's proposal to form street railways in the Marylebone district, he withdrew his application at a meeting of the representative council, on Saturday last, in order to give the vestry an opportunity of seeing his scheme carried into operation in Victoria-street. On Tuesday he attended a meeting of the Commissioners of Sewers, to explain his plans for the introduction of street railways in the crowded thoroughfares of the City. On the ground that he had himself admitted that he was not anxious now to commence his operations in this part of the metropolis, the consideration of the subject was postponed for a month.

The rapid progress of the volunteer movement is truly gratifying. The number of riflemen, originally ascribed to be 70,000, then 150,000, is now estimated at 200,000. Reports of rifle matches reach us from all parts of the country. At Highdown, near Liverpool, the Lancashire contest commenced this week, the aggregate value of the prizes contending for amounting to £1,000. The prizes to those members of the St. George's Rifles who had been successful in the recent shooting-match, were distributed on Monday last by Sir Hamilton Seymour. He took the opportunity, in a spirited speech, to express a conviction that the rifle movement will be permanent. It had been found so conducive to public health as already to have affected the bills of mortality.

His Royal Highness the Prince of Wales met with a magnificent reception at New York. On the day after his arrival he visited the University and other public institutions, and was entertained to a great ball at the Academy of Music. His Royal Highness left New York on the 15th ult., and arrived at Boston on the evening of the 17th, and was received in that city with the greatest enthusiasm. He arrived at Portland on the 20th, and the same day embarked for England.

The arrival of the Cape mail brings further news of the progress of Prince Alfred in Southern Africa. After visiting the capital of the Orange River Free State he passed through Wynberg to Harismith, on the Natal boundary. Thence he proceeded to Durban, where he met with a warm welcome. On the 6th he re-embarked in the *Euryalus*, and on the 17th he left the foundation-stone of the Breakwater at Cape Town, a ceremony which is looked upon in the colony as the great event of his visit. After inaugurating a Sailors' Home and a new Library Hall he left the colony on the 19th, amid the liveliest demonstrations of respect and loyalty.

The Earl of Donalmond, one of the most remarkable men the country has produced, died at his residence in Kensington on the morning of the 31st ult.

MONEY AND COMMERCE.

THE Bank of England has not as yet raised its minimum rate of discount, and the minds of public writers on this question have fluctuated almost from day to day. In the early part of the week money was temporarily abundant, the market easy, and the hopes high. As the week advanced, the market was less easy, the demand on the Bank increased, gold was again withdrawn, and fears of a rise in the rate of discount again predominated. Permanent ease is out of the question, but how long it will be before the risk takes place we cannot say. Something is due to the nature of our trade, a less amount of liquid tender being required for an active foreign trade carried on chiefly by bills than for an active home and retail trade carried on by ready money.

On Thursday, November 1st, the Bank was silent as usual for striking the balance of its accounts, and no business was done on the Stock Exchange. With no change in the money market, and no great political changes, the funds and shares have continued very steady. Consols have gravitated about 93. Railway shares have only slightly fluctuated, and are not depressed. Of foreign funds only the Turkish have become a little lively; on what the expectation of improvement in the condition of Turkey is founded does not appear. The shares of the Grand Trunk and Great Western of Canada do not keep up so well as the shares of the leading lines in the United States. Stocks suitable for permanent investment keep remarkably steady.

The corn market, too, has not undergone any great changes in the week. Large quantities of foreign corn continue to arrive, and thence, with what was in store, has in general kept the market full. A comparatively small quantity of our own crops has, as yet, been sold, and this being composed of many different qualities, various prices are demanded.

Sugar, rice, tea, and other foreign products, particularly the first named, have all been in increased demand, and prices have tended upwards. The stocks of sugar and the arrivals are comparatively small; and although the reports from the sugar-growing countries are favourable as to the cane-crop, the price has risen.

The markets for our manufactures continue active and good; but for such productions as Nottingham lace, which depend very much on the home market, the demand is not active.

The great increase of the exports in September, 18 per cent. as compared to last September, and in the eight months of the year, of 4 per cent. shows very conclusively that the dullness of trade complained of through the year, is confined to our home and internal trade. A similar tale is told by our imports. In the eight months of which the returns are published, the computed value of our principal imports rose from 80 millions to 106 millions. From this great increase of our foreign trade, the opinion that the seasonal spring, the cold, wet summer and autumn, causing a great compensatory deficiency of horticultural and agricultural produce, has greatly impeded our prosperity, is amply confirmed. Had the season been favourable we should have heard some of the complainers that have arisen in Coventry, Birmingham, and other places. The ribbon-manufacturers (as Mr. Cobden has stated), the Spitalfields weavers, the Birmingham millers, the retail drapers and grocers, and others, have only suffered from the deficiency of the home demand, and in the home-grown produce, from which they have to look for their reward. We ought to remember this fact in our discussion about the French Treaty and other political matters to which some persons continually ascribe the dulness of trade.

The value of cottons, linens, woollens, and mixed fabrics of silk exported, also the value of metals, except railway iron, is considerably in excess of last year.

The changes made in the French tariff—some of which were published, as we then announced, last week—have been received by our manufacturers with general approbation. They know that what is now done will lead to further changes; that every extension of freedom in one direction, makes it necessary to extend it in another; and if the present changes are not all that they desire, they receive them thankfully, and hope for greater improvements. The men of Wolverhampton, for example, say that as respects hardware they are agreeably surprised to find the duties so low. On cast-iron goods, common castings, &c., the duty will be only 21. 8s. 6d. per ton. Hollow wares, including pots and pans, will pay only 22. 6s. 6d. on import, and till now such articles were prohibited. If tinued or ennobled the duty will be 24. 10s. 7d. per ton. This is only a specimen of the permission granted to import articles at a low duty before prohibited; and as it applies to articles very much in use in England, and very much required in France, we may reasonably expect that the French will profit by these conveniences, and that a mutually beneficial exchange will rapidly extend—the produce of the prosperity of France for that of the artisans of England. Such articles are now subjected to heavier duties in the United States than they will hereafter be in France.

The import of crude iron in lumps or prisms, not freed from the dross, is another article which was prohibited in France; now it is to be admitted, subject to a duty of five francs per 100 kilograms, and already purchasers from France have appeared in Staffordshire for this material.

It is a pity that the *Times*, before publishing, on Thursday, an amusing article on the French tariff, did not look into the *Gazette*. In that it would have seen that many of the freely-imposed duties which it describes, not cutters economically, as "tortures infinitely great and infinitely small on British industry," are substituted for prohibitions. Thirteen times is the word "prohibited" applied to classes of articles specified in the enumerations of the part of the tariff published; and if the restrictions substituted for these prohibitions be tortures, the prohibitions were meant to be death. Undoubtedly, the new condition of the trade between England and France is very far from free; but the tortures belong to the old system, and the blessings to the new. They will be, we believe, very small impediments in the way of our imports into France; but they will constitute, for some time, very grievous inflictions on the French.

MEN OF MARK.—No. VIII.

MR. WILLIAM BROWN—(continued from last).

Mr. Brown's steady advocacy of Liberal and Free Trade principles had marked him out as an eligible candidate for South Lancashire in the League interest. Some stirrings of Parliamentary ambition seconded the entreaties of his friends; and in 1844 he contested the Southern division unsuccessfully against Mr. Entwistle. He polled no less than 6,973 votes, but was defeated by a majority of 600. Mr. Brown now threw himself heartily into the League agitation, presided at Liverpool Free-trade gathering, and took the chair at one of the League meetings held in Court-garden Theatre. When the League resolved, in 1855, to raise a fund of a quarter of a million, he sent £1,000 as his contribution. The year 1846 found him battling for free trade, both with tongue and pen. He presided at League meetings in Liverpool, and engaged in a controversy with Mr. Albert Lawrence, then of Bolton, but afterwards the accomplished United States Minister at the Court of St. James. Mr. Brown's letters in favour of commercial reform and free trade, and Mr. Albert Lawrence's rejoinder, were published in a Boston paper, and afterwards reprinted in this country.

Lord Francis Egerton having succeeded to the title of Earl of Ellesmere, a vacancy was created in the representation of South Lancashire. Mr. Brown was elected without opposition in June, 1846, and took his seat in time to hear the royal assent given to the Corn-law Repeal Bill. The dissolution of the League followed. At a meeting of the League held in Manchester, Mr. Bright (seconded by Mr. Cobden) moved the first resolution, dissolving the League; while Mr. Brown followed with a second resolution, providing for the reconstitution of the League, should any attempt be made to reimpose such taxes on food. The League voted Mr. George Wilson £10,000, and £10,000 to Mr. Cobden was commended. Mr. Brown put his firm down for £1,000, and the subscription thus headed eventually realised £80,000. In September Mr. Brown was entertained at a public dinner at Warrington, in celebration of his return for the county. In the following year he was selected to represent the Free-traders of Lancashire at the Brussels Congress of all Nations.

A gentleman who entered, in his sixty-second year, an assembly proverbially jealous of all reputations not of its own making, could scarcely hope to make a parliamentary name. Yet Mr. Brown made a favourable debut. His maiden speech was delivered on Lord John Russell's motion to suspend the duties, in January, 1847. Mr. Brown replied to the Protectionist leader, Lord George Bentinck, with so much success that Lord John, who was then Prime Minister, congratulated the House upon the valuable accession they had gained in the new Member for South Lancashire, whose speech, he added, rendered it unnecessary for him to reply to Lord George Bentinck. Mr. Brown took his seat on the Ministerial benches, and not unfrequently addressed the House on commercial topics. Of the middle height, he was, at this period, somewhat robust, wore spectacles, and already, from his grey hairs, that receded from his forehead, had something venerable in his appearance. His features were somewhat strongly marked, of the Hibernian type, with the frontal development just above the eyes so often associated with a knowledge of the world and great prescience of faculties. His voice, unfortunately, was often so weak, and his utterance so indistinct, that the least buzz of conversation was fatal to the comprehension of his meaning. Sometimes even the strained attention of a thin House was insufficient. A singular, and almost unprecedented circumstance which passed under the writer's eye, will illustrate both Mr. Brown's inaudibility in the House and the value attached to his speeches. The honourable Member was the warm advocate of a decimal coinage, and on one occasion gave notice of his intention to bring it before the House. As it was his intention to quote a great deal of documentary evidence in support of his views, the honourable gentleman, for the convenience of referring to his papers, spoke from the table on the Opposition side. Members turned their best ear to the great merchant; but as few of his remarks reached them, it is no wonder that a gentleman, and to be connected with the Mint, who had been favoured with a seat under the gallery, was still less fortunate. Not a syllable could be heard, who had come prepared to enjoy a great intellectual and arithmetical treat. He converted his hand into an ear-trumpet, but in vain, and his despair grew tragic. At length, as the sound would not come to Gamaliel, Gamaliel determined. Accidentally he left his seat, and entering the sacred precincts of the House, he snatched some of the Opposition benches, nor stopped until he had gained the bench immediately behind Mr. Brown, where he composed himself to the enjoyment of the honourable Member's remarks.

After a few minutes, for the speech was a long one, an usher was struck by a face not familiar to him, and he asked a brother-usher "who that new member was?" Nobody knew him. The clerks at the table were appealed to, but they could not remember having administered the oaths to the strange visitor. The Serjeant-at-Arms was now apprised that there was a stranger, or what seemed such, in the body of the House. The matter became serious. It is a high breach of privilege for any person not a member to enter the House itself (in which is not meant the part allotted to strangers), the penalty being commitment to custody, if not removal to Newgate or the Tower, and the payment of a good round sum in the shape of fees. The Deputy Serjeant-at-Arms made his way to the stranger, asked him to follow him, and led him from the body of the House. We all expected a "scene"—an appearance at the bar, a humble apology, a rebuke from the Speaker or, perhaps, a remand and a search for precedents. Mr. Shaw Lefevre (now Viscount Eversleigh), however, took a more lenient and sensible view of the matter, and strained the practice of the House in the visitor's favour. His conduct was so manifestly involuntary, and Mr. Brown was so profoundly inaudible, that the Serjeant-at-Arms the offender was therefore dismissed, and the matter was never brought before the House at all. Mr. Brown all this time, unconscious of the occurrence, was quoting his

statistics, reading his documents, endeavouring, in vain, to make himself heard, and suggesting to Mr. Monckton Milnes those regrets that the honourable Member had not entered Parliament earlier, which he expressed the other day, in general terms, at Pontefract.

At the next election, in 1847, Mr. Brown was elected for South Lancashire without opposition. Mr. C. P. Villiers was returned with him, as a proper compliment to his early and unwarmed advocacy of free trade. But that gentleman was also elected for Wolverhampton, and on his choosing to sit for that borough the electors sent Mr. Henry to Parliament as Mr. Brown's colleague. It is recorded that Mr. Brown voted on 115 divisions during the session of 1847-8, and the praise of assiduity in the discharge of his parliamentary duties cannot fairly be denied him.

But the greatest public service rendered by Mr. Brown, if not in Parliament, yet in virtue of his parliamentary position, was in 1856. The Government of the United States declared that the British Minister at Washington had violated the law of the United States in raising a foreign legion in the Union for service in the Crimea, and summarily dismissed Mr. Crampton. Lord Palmerston warmly revented the insult, and vindicated the conduct of Her Majesty's Minister. The American Government had allowed proceedings to go on which they afterwards contended were contrary to the law of the United States, without sending for Mr. Crampton, or telling him what it was supposed he was guilty of doing. "They allow us things to accumulate," said Lord Palmerston, "in order that, when the proper time arrives, they may either take advantage of them, or deal with them as matters which do not deserve consideration." These views being fully shared by the Cabinet, the public were prepared by a semi-official announcement for the dismissal of Mr. Dallas. Great alarm prevailed in monetary and commercial circles. A sudden activity was observable in our arsenals and dockyards. Supplies of the *satellite* of war were sent out to Canada; and the Secretary of State for the Colonies assured the Canadians that they would be supported by the whole force of the mother country in the event of war. Troops were despatched to British North America, and heavily-armed vessels of war received sailing orders for the American coast. So great was the uneasiness, that the undersecretary at Lloyd's were asked in almost every case to insure against capture and seizure, and a percentage was actually charged for the increased risk. Public opinion at home supported the Government in declaring that Mr. Crampton's dismissal by President Pierce was unjustifiable, indefensible, and offensive.

At this moment of peril, when the rupture of diplomatic negotiations between the two countries would probably have been followed by insulting and belittling proceedings on the Canadian frontier and in Central America, Mr. Brown came forward as a mediator between the two countries. His dispeared irritating debates in Parliament, indeed Mr. Balfie to withdraw a party question condemnatory of the Government in regard to enlistment in the States, and made an appeal to a student Irish Member, who was allowed to make a speech on the subject, which fixed him with a tremendous weight of responsibility, and procured him a signal defeat on a division. The honourable member for South Lancashire offered his personal mediation between Lord Palmerston and Mr. Dallas, and meanwhile expressed his conviction in the House of Commons, that the disputes between the two countries would be amicably arranged to the satisfaction of both Governments, if no new cause of disagreement were supplied by party debates. The American Minister in London gladly accepted Mr. Brown's mediation, for he did not wish to be sent back to Washington. With Lord Palmerston the honourable Member's task was more difficult. What took place at these interviews has never been publicly stated. Some asserted that Mr. Brown put before the Premier facts and figures proving that a rupture between the two countries would be followed not only by rebellion in the States States, but also by a revolution in Lancashire. Others, with perhaps more reason, opine that Mr. Brown represented the conduct of the American Government as an attempt to get a little "Baconian" out of the difficulty, with an eye to the next presidential election, and was so regarded in the union—that the attempt would signally fail (as the event proved)—and that if Lord Palmerston would only treat the affair as an unimportant and desperate attempt to get up a little political capital, he would, in a few months, be rewarded for his forbearance by seeing President Pierce and Secretary Marcy relapse into political obscurity and insignificance. Those who know Lord Palmerston best, affirm that the appeal to his magnanimity succeeded, when cotton statistics, tonnage, and all sorts of figures failed to shake his resolution to vindicate the insult passed upon Her Majesty's representative. The Prime Minister yielded to the representations of one who spoke with peculiar weight, not only as a merchant, but as one of the most consistent and influential of Lord Palmerston's admirers and supporters in Parliament.

Mr. Brown was not, however, satisfied with mediating between the two Governments. He appealed to the two nations, and at his instance Liverpool, Manchester, and other English towns, adopted addresses to the larger and more influential cities of the Union. These demonstrations elicited cordial and satisfactory replies from the other side of the Atlantic, breaking peace, and denouncing those who attempted to kindle dissension between two great and kindred nations. The political horizon soon cleared. Mr. Dallas remained in London, and Mr. Brown received the thanks and congratulations of all who knew his noble and useful endeavours to avert so hideous, unnatural, and horrible an event as a war between the two countries.

The honourable Member retired from Parliament, full of years and honours, in 1859, being warned by his increasing winters to seek for the repose which a parliamentary life denies to those who do their duty faithfully to their constituents.

So long ago as 1853, Mr. Brown, who had given £1,000 to the Northern Hospital, offered to build a Public Library for the town of Liverpool, at a cost of £20,000, on condition that the corporation would provide a suitable site. The offer was accepted, but some tardiness having been manifested by the town

council, Mr. Brown, in 1856, extended his offer to £12,000. The design had now grown from a Free Public Library to a Public Museum, capacious enough to contain the splendid natural history collection bequeathed to the town of Liverpool by the late Earl of Derby. Even this magnificent offer provoked delay. At length, Mr. Brown, wishing, as he said, to see the building erected, and in operation during his life, declared his willingness to construct a Free Public Library and Museum, and present it to his fellow-townsmen. The princely gift has cost the donor about £40,000, while the cost incurred by the corporation and the museum committee in the site is estimated at £25,000 more.

Mr. Brown is unhappily a widower, and childless. Mrs. Brown died about three years ago, having lived to mourn the loss of her son and daughter. Mr. Brown, however, enjoys the society of grandchildren and other relatives, his son Alexander having left a wife and children, who reside with him at Richmond Hill, near Liverpool. Mr. Brown's brother James, who established himself in New York about the time that William commenced his successful career at Liverpool, took part in the inauguration ceremony the week before last, and had the gratification of hearing, with his two sons, the splendid speeches of Lord Brougham, Lord Stanley, and other distinguished guests, in praise of his brother's munificence.

And now to what conclusion do we arrive as to the character of commerce, after this examination of the life and career of one in whom the merchant prince of Florence seems again to revisit the earth? With a slight adaptation of the glowing and almost prophetic words of the American "Knickerbocker," we may say—"We find that the real source of national prosperity, greatness, and power is the once condemned pursuit of commerce. We find that commerce is a civilizing principle, eminently favourable to the advancement of science and the cultivation of intellect, potent in its operation on the welfare of states, adverse to war and discord, a promoter of human happiness, and the natural and efficient stimulus to production, because it is the means by which the advantages of productions are realized. We find that commerce is creative, beneficial, pacific, light-diffusing, and promotive of human comfort. We find that, for all charitable institutions, for the relief of individuals or communities in distress, for the endowment of literary and scientific bodies,—in a word, for every kind of beneficent purpose or object, the donations of the merchants are always the largest and the most freely given. We find that a first-rate merchant is one of the most useful and honourable members of society, and that to constitute a first-rate merchant are demanded the highest attributes of mind and disposition, clearness and vigour of intellect, extensive knowledge, sound judgment, perfect integrity, liberality of sentiment, and unswerving honour. To COMMERCE, then, as well for its beneficent influence as for the worthy and distinguished men it has produced, the most intellectual, the most instructed, and the most philanthropic men that ever lived might esteem it no less than an honour to belong."

THE GOUTY PHILOSOPHER.—No. XVII.

MR. WAGSTAFFE EXPRESSES HIS OPINION OF POPULARITY.

It was said in my presence a few days ago, at a certain great house in Pall-mall, by one who did not know that Mr. Wagstaffe was of the company, that the "GOUTY PHILOSOPHER" was a popular writer. I vehemently denied the assertion, and I am quite certain from the looks of some of the people who heard me, that my dissent was ascribed by one kind friend to my envy—by another to my ill-nature—and by a third to my utter ignorance both of Mr. Wagstaffe and of his lucubrations.

If I do achieve popularity—a result of my labours which I certainly do not expect—it will not be because I have striven for it. I have lived long enough to be able to estimate popular favour at its true value, and to despise it accordingly—with all its insanities and insanities. A man may become popular in spite of himself, and be none the worse for it; and such a popularity I for one will neither despise nor depreciate; but, whether in politics, in literature, in art, or in preaching, I hold that the man who makes himself a popularity-hunter is a charlatan—or worse. To my mind the assertion that the people care what is called the mob, but the majority of living men and women of all ranks and classes are the best judges of merit and virtue, and form the supreme Court of Criticism, is a rank absurdity; while the old Roman saying, that the voice of the people is the voice of God, seems to me little less than blasphemous. Get together ten thousand people in any country in the world—I do not care whether they be English, Scotch, Irish, French, Germans, Americans, Italians, or Chinese—and ask yourself, or any other wise man, what is the percentage of prudent, humane, well-informed, educated, and reasonable beings among them? It is three per cent. I Perhaps? Five per cent. Certainly not. And shall the ninety-seven fools out of every hundred people pretend that their opinion and their voice are divine, and that they are the supreme and ultimate judges of right and wrong? of literature? of art? or of anything that does not make a direct appeal to their stomachs or their pockets? As for me, I speak for the three and not for the hundred. I want a fit audience—not a numerous one—and would rather that one true, good fellow should think me a true, good fellow, than that ninety-nine donkeys should busy their delight at my heels—not knowing why they made such a noise, and being quite as ready to busy their displeasure if they were told to do so by some aristocratic donkey, far more stupid than themselves.

Popularity is a shallow, empty, frivolous, unmeaning shell and semblance. The street play of Punch and Judy is more popular than *Othello* and *Desdemona*. Harlequin and Columbine commend themselves to a greater amount of popular favour than *Hamlet* and *Opheelia*. The so-called *Negro Melodies* are more popular than the loveliest or grandest works of Mozart, Beethoven,

or Mendelssohn. If you doubt it, ask Messrs. Cramer & Beale, or the proprietors of the *Musical Bazaar*. In the estimation of the people, is Julius Cæsar equal to Clown? or Oliver Cromwell to Hackquin? Is the noblest song of Burns or Moore half so well esteemed by the multitude as "Billy Barlow," "The Ratcatcher's Daughter," or "Old Dog Tray"? Is Newton's "Principia" popular? Or Bacon's "Novum Organum"? Or Milton's "Paradise Lost"? Or Plato's "Philosophy"? Or Whately's "Logic"? Or Kant's "Metaphysics"? Or Shakspeare's Sonnets? Or Laplace's "Mécanique Céleste"? Beh!

"'Tis my delight on a shaly night,
In the season of the year."

that is the poetry of the million. "Make money honestly if you can; but at all events make money"—that is the philosophy of the million. The Red Lion on the signboard of the public-house,—that is the fine art of the million. The figure-head of a ship, or the Highlander at the door of a snuff-shop,—that is the sculpture of the million. A public hanging at Newgate, or Hosenunger-lane,—that is the great show and spectacle of the million, to enjoy which, men and women, boys and girls, will sit out in the rain for a whole night, in order to secure a good place and a good place in the morning. It has been said in support of the foolish principle of the "Yox populi vox Dei," that in a crowded theatre the audience always laughs at the right joke, and, as a matter of course, applauds the most virtuous sentiments; but what of that? There is not one man among them who would laugh at the same jokes if told to him privately; or who would appreciate the stage virtue if it came before him in the ordinary intercourse of life and business. The stupider the joke, the more it is appreciated in public; and the more trite and obvious the morality, the better the majority like it upon the stage, and the more they refuse to conform to it everywhere else.

The principle may be tested in a variety of ways. Let me test it by popularity in preaching. Who, I ask, is the popular preacher in our day? Is it the man, who in scholarly language, with noble elocution, with high command of rhetoric and logic, and the aid of all the graces that flow from a cultivated, gentlemanly, and, above all, a charitable mind, inculcates the purest and loftiest Christianity? Not so. Such a man may preach to empty pews, unless he be a lord as well as a clergyman, when the trifling jests will run after him, not for his piety, but for his rank and social position. The really popular preacher is the man of fire and brimstone—the man who, with furious gesticulations, damns to eternal perdition all the world that dares to disagree with him—the man who rants and raves, and will allow of no salvation beyond the limits of his own little self-conceited sect; who jeers and jests in the pulpit, who treats his congregation as if they were an audience at a theatre, and turns what ought to be the most serious business of life into a farce. The "comic pulpit"! The very name that offends the judicious, attracts the multitude. They have been sent to sleep by pulpit oratory many a time and oft. Why should not pulpit oratory make them laugh? It is not the doctrine for which they care;—they allow doctrine to take care of itself. They desire to be amused on the Sunday as well as on the Saturday; and if the comic preacher amuses them, is he not, in their estimation, a great preacher, and worthy to be popular now and for evermore? Do not his vulgar portraits drawn from the windows of the printshops in juxtaposition and rivalry with those of Sayers and Heenan? Honest Dr. Priestsnow, or any other rural vicar, as gentle and as kind as he, and passing his non-stations life in deeds of charity and comfort to the poor, would have no chance against such a Bonaparte, with or without his brimstone.

And on this point of popular preaching, though I grieve to be compelled to say it, let the pulpit orator but cease to be a bachelor, and his congregations, like his shippers, will grow fewer and fewer. Neither the Rev. Mr. Brinstone nor the Rev. Mr. Treacle should rush into matrimony, if he desires to remain popular. For him no more costly cassocks, no more splendidly-bound Bibles, no more elegantly-wrought braces, no more purses heavy with new sovereigns, subscribed by the fair ladies of his congregation, after he shall have taken that fatal step. He may be a good preacher and a good man after he marries, but his popularity will depart to return no more.

I shall next test the principle of popularity by literature, and begin with the newspapers. What is the most popular article in a daily journal? Is it the brilliant leader, or the noble speech in Parliament of a minister, or of a minister's opponent? Emphatically, no. It is the filthy story narrated before Sir Creswell Creswell, or the ludicrous detail of the last new scandal that has afflicted and scandalized the town. For one man who reads the leader or the speech, fifty men and women read the dirty law case; and a hundred gloat over the details of the murder, or of the murderer's execution.

Then, as to books!—Macaulay's History of England never reached half as many editions, or sold a title of as many copies, as the "elegantly pious and sweetly sentimental" details of the life, correspondence, and death of Capt. Hoody Vicars. The ingenuous vaticinations of a celebrated divine, who tells the world that it will come to an end in 1866, or thereabouts, employ the paper mills, the compositors, the binders, and the retail booksellers more largely than the books of any other Divine of the day. Somehow or other the people like to be told that the end of the world is close at hand; and although they don't believe it, they are none the less interested and instructed. A sensation is something worth having;—and this is a very peculiar and delightful sensation as long as it is thought

about. Mr. Dickens, Mr. Thackeray, and Sir E. Bulwer-Lytton are doubtless popular writers; but the trashy romances published in the penny weekly journals reach a far more numerous audience than their works ever penetrated into. The "Dream Book of Mother Shipton," the "Book of Fate," the "Oracle of the Future," and the lives of Jack Sheppard and Dick Turpin, far exceed in sale, and therefore in popularity, the works of all these writers put together, and the works of Sir Walter Scott, or any fifty lady writers you like to name, thrown into the scale as a snake-weight.

Test popularity in another sense, and see what it amounts to. Power, not virtue, is what the people applaud. The same crowds who shouted their loud shouts at the coronation of Louis XVI., shouted their execration at his scaffold. Why? Because he was powerful in the one case, and powerless in the other. Boleskier was lord and master of the crowd one day. The next he was the vilest of the vile in the people's estimation, though neither by word, deed, or intention had he changed in the interval. But his enemies had got the better of him; he was weak, and he was execrated accordingly. Napoleon Bonaparte smiled when he was a poor sub-lieutenant, but nobody saw anything in his smile beyond the smile of any other poor wretch toiling for his daily bread,—a very commonplace, unmeaning smile, no doubt;—but when he became Emperor, the same smile was pronounced by the most competent and skillful judges of smiles, to be absolutely angelic, and to have a supernatural fascination, only to be accounted for by the places or positions that were expected to flow out of it, like light from the sun. The multitude who greeted Napoleon III., on his state visit to London, with such a *furore* of gratulation, applauded him for his power. Had the *coup d'état* been a *coup manqué*, and he had escaped with his head upon his shoulders to London, would there have been a crowd at his heels? We have been told within a few days by Mazzini, that a Neapolitan mob are crying out "*Morte!*" against him, for a few ducats distributed amongst them. Can there be any doubt that they would cry out "*Vive!*" for a few ducats more? Who, it may be asked, was so popular as M. de Lamartine when he had the power of all France in his hands? And who is less popular now that he has no power, and can scarcely make both ends meet in his humble but honourable household? But all this is a vain trite, and need not be insisted upon. Popular favour! he that depends upon it—

"Beings with fins of lead,
And heads down sunk with reeds,
Hang ye! trust ye!
With every minute you do change a mile;
And call him noble that was once your slave,
His title that was yours is now a lie."

Popularity hangs upon power, and power once gone, away goes popularity—as the shadow flies when the substance has departed.

The fact is, that there is nothing in this world which the great bulk of the people, in all climates and countries, can really understand or appreciate, except physical and mechanical power. Intellectual power is too huge—too vast—too deep—too delicate—for their capacity. They cannot measure it, weigh it, understand it, or even become aware of it. A prize-fight—a bull-fight—a cock-fight—or a great battle between the armies of two rival potentates—these are the things they can feel and appreciate. They understand Heenan and Sayers, Napoleon and Wellington, and the winner of the Derby; but they can no more understand intellect than a jinn can hold a quart, or a fly on the dome of St. Paul's understand the debates in the British Parliament. In conclusion, I state my opinion firmly, not dogmatically, that nobody while living was ever popular in any nation, except for his physical qualities, and that nobody ever will be really popular for any other quality until he shall be dead and buried. Then, perhaps, when he is in nobody's way, the public may rub his droowy eyes, and admit that the dead man was a great man—rest his soul! Power of body—power over men's lives and fortunes—power of giving away places, pensions, and propinquities—these are the sources of popularity. Power of mind, in any of its manifestations of reason, fancy, or imagination, never is, never was, never will be popular until Death seals it with sanctity. As long as the mass of mankind are ignorant, so long will mere popularity not be worth having. The memory of Charles II. remains popular, no one knows why, unless it be for the power of his vices; and that of William III. remains unpopular, no one knows why, unless it be for the grim honesty of his character, and the sturdiness of his intellect. And of all the creations of the teeming brain and noble intellect of Shakespeare, which is the most popular! The greatest blackguard he ever drew—the cowardly lascivious knave and cheat, Sir John Falstaff. The popular and populous world can understand Falstaff; Hamlet is infinitely above its comprehension. He belongs to the three, and not to the ninety-seven.

Popularity! quotha! he who hunts it may get it; but it is a dead, ear apple when acquired—full, not of juice, but of dust and ashes.

ENGLISH ART ON THE CONTINENT.

At the annual exhibition of works of living artists, which has just come to a close at Brussels, there occurred an event which is not without its importance. Then, for the first time (with insignificant exceptions), English artists presented themselves before a foreign public. When we heard that such was to be the case, we looked forward to the result with some degree of confidence—hoping they would achieve a success that would be creditable to themselves and honourable to their country. We must now acknowledge ourselves disappointed. English art was represented on the occasion by Landseer, D. Roberts, Ward, Dyce, Egg, and two or three others of less note—each of whom had forwarded but one work. Sir Edwin Landseer's contri-

bution was that large grey canvas which last year was exhibited in Trafalgar square, and in which, although great technical powers are manifested, such strange confusion predominates, that it is only with great difficulty and after much attention, the meaning of the representation can be at all understood. "Jerusalem, from the South," the work sent by Mr. Roberts, is not unlike a chromo-lithograph, and its exhibition will certainly not tend to enhance the reputation of the author amongst those to whom he, like Landseer, is almost exclusively known by published engravings of his works. Such persons will be under the necessity of concluding that these two artists—the only English painters, perhaps, whose reputations stand beyond the limits of their own country—owe more to the skill of the engraver than they had hitherto supposed.

Mr. Egg's picture, "Past and Present," which was favourably noticed when exhibited at our own Academy, on the other side of the channel scarcely received the notice it merits elsewhere. But this there is little to wonder at. The picture does not explain itself, and the information given in the catalogue seemed framed for the purpose of conveying no meaning. The work was an enigma, and an enigma the solution of which the public did not care to attempt. They passed to something else. "Titan's First Essay at Colour" by Mr. Dyce, is not likely to detain them. They shrug their shoulders as they pass it, and wish to be informed whether the painter has attempted the imitation of some stained-glass window. The work Mr. Ward has selected for exhibition was "Marie Antoinette Listening to the Reading of her Bill of Indictment." On the same wall hangs a picture (by Muller of Paris) similar—almost identical—in character, "Marie Antoinette listening to the Reading of her Death Warrant." With this Mr. Ward's production was very frequently compared—indeed, from the similarity of subject, one could scarcely fail to compare them—and the conclusion, we believe, generally arrived at by the French, was that it was unnecessary, both to the artist and to the public.

This was English art represented. From what has been said, the reader—if he has any the slightest acquaintance with matters of art—must perceive that amongst a collection of works to which Gerard, Madox, Troyon, Delfens, Robert-Fleury, Israels, &c. had contributed, English art did not get itself efficiently represented on the Continent. In this contrast, the English artists, if it produce no quantity and quality. It is, however, to be hoped that the example set by the English gentlemen we have named will be extensively followed hereafter. An annual opportunity presents itself; the Exhibition is held alternately at Brussels, Ghent, and Antwerp. A more frequent comparison of English works with those of foreign artists, if it produce so other result, will have the effect of eradicated that mania which, either in conception or execution, characterises all the works of our English School. For, just as an inhabitant of these islands carries with him a something which, to men of other lands, proclaims his nationality, so do the productions of English painters—however and wherever they are shown—suffer from such self-evident—hardly incontestable evidence of their island origin. An English citizen may justly be proud of his country, and may, if he chose confess it by his demeanour. But with an English painter it is otherwise. A painter is properly and emphatically a translator; and, whether he be symbolizing ideas, or depicting scenes, or conveying impressions, representing realities, whether of action or sentiment, fact or fiction, or both combined, he should ever use a language universally understood. The materials may be local, but the rendering must be universal; the effect must be absolute, not relative. He should not be understood by the inhabitants of his own island alone; there must be those who are not of his island who should be those of a cosmopolitan; his representations should be appreciable by all. In proportion as he accomplishes this will his success be.

A more extensive acquaintance with foreign art, and a more frequent competition with foreign artists, may likewise have the good effect of checking a tendency which seems to be gaining ground amongst our artists;—namely, to suppose Art to have the same end and object as Morality and Religion, and to regard it as something mystical. This fundamental fallacy is at once stale and new; stale because it was long ago refuted by Goethe, among others; new, because the refutation is unknown or forgotten by the public. In opposition to this fallacy, now revived by John Ruskin and others, Goethe continually and successfully contended that Art is no longer Art unless it be allowed an end and object specially its own—that, namely, of pleasing. As, however, in so doing, it appeals to some of the highest feelings of man, it incidentally becomes an ally of Morality and Religion; but it is only incidentally so, and it is not its end and object. We earnestly hope English artists will take note of this, and not allow the well-established and approved idea to be subverted by the crude ignorance of those who, whenever a particular study becomes the fashion, are absorbed by it, and pretend to find in it the whole of their social and religious life.

VICTOR HUGO'S "RUY BLAS."

MR. FALCONER'S adaptation of Victor Hugo's "Ruy Blas," furnishes a conspicuous illustration of that timidity of hand, which is apparent in almost all attempts to transplant upon our stage the highest examples of the French romantic drama. With the fear of our English prejudices before his eyes, Mr. Falconer has destroyed the vital interest of the play at its very source, by untranslating the Queen of Spain into the *Princesse de Nemours*. He evidently thought it would be dangerous to allow a French noble lady to be the object of a serious passion, as if we hadn't already in a hundred plays of our own; and so he has made the *Princesse* neither wedded nor single, but hovering between both as the affianced wife of the youthful king, married in her cradle by proxy, which, in effect, is an obligation to marry and not a marriage. Mr. Falconer does not seem to have perceived that by this arrangement, which leaves open the possibility of a prosperous issue to the devotion of the lover, he annihilates the fundamental idea of the drama. The great terror, that hangs suspended like destiny over the action, is taken out of the play, and the tragic interest is displaced by a melodramatic under-plot. What is really grand in the original, was in the English version of the play for his open, the distance between them, and the barrier which it was destruction to both to pass. It is a pity that it should be thought complimentary to our morality to alter the conditions of a great conception, the interpretation of which depends upon their strict observance.

it is laid in "the robing-room" of the sovereign, ready for use upon the arrival of the Queen.

As little ceremony is used in removing it back to the Tower, as in taking it away.

It is difficult to declare what is the precise value of the jewels in the Queen's crown; but this is affirmed with respect to it, that unlike most other princely crowns in Europe, whether of Kings, emperors, or grand dukes, that all the jewels in the British crown are really precious stones; whereas in other state crowns, valuable stones have been replaced by bits of coloured glass, and the consequence is that their estimated value is far beyond what such crown jewels are really worth. We subjoin a representation of the crown, and full reliance may be placed on the following description of the jewels, for which we are indebted to Professor Tennent, Lecturer on Geology in the King's College:—

THE IMPERIAL STATE CROWN OF HER MAJESTY QUEEN VICTORIA.

FRONT VIEW.

BACK VIEW.

"The Imperial State Crown of Her Majesty Queen Victoria was made by Messrs. Rundell and Bridge in the year 1838, with jewels taken from old Crowns, and others furnished by command of Her Majesty. It consists of diamonds, pearls, rubies, sapphires, and emeralds, set in silver and gold; it has a crimson velvet cap with ermine border, and is lined with white silk. Its gross weight is 390s. 5dwts. troy. The lower part of the band, above the ermine border, consists of a row of one hundred and twenty-nine pearls, and the upper part, of the band a row of one hundred and twelve pearls, between which, in front of the Crown, is a large sapphire (partly drilled), purchased for the Crown by His Majesty King George the Fourth. At the back is a sapphire of smaller size, and six other sapphires (three on each side), between which are eight emeralds.

"Above and below the seven sapphires are fourteen diamonds, and around the eight emeralds one hundred and twenty-eight diamonds. Between the emeralds and sapphires are sixteen trefoil ornaments, containing one hundred and sixty diamonds. Above the band are eight sapphires surmounted by eight diamonds, between which are eight festoons consisting of one hundred and forty-eight diamonds.

"In front of the Crown, and in the centre of a diamond Maltese cross, is the famous ruby said to have been given to Edward Prince of Wales, son of Edward the Third, called the Black Prince, by Don Pedro, King of Castile, after the battle of Najera, near Vittoria, A.D. 1367. This ruby was worn in the helmet of

Henry the Fifth at the battle of Agincourt, A.D. 1415. It is pierced quite through after the Eastern custom, the upper part of the piercing being filled up by a small ruby. Around this ruby, to form the cross, are seventy-five brilliant diamonds. Three other Maltese crosses forming the two sides and back of the Crown, have emerald centres, and contain respectively one hundred and thirty-two, one hundred and twenty-four, and one hundred and thirty brilliant diamonds.

"Between the four Maltese crosses are four ornaments in the form of the French fleur-de-lis, with four rubies in the centres, and surrounded by rose diamonds, containing respectively eighty-five, eighty-six, eighty-six, and eighty-seven rose diamonds.

"From the Maltese crosses issue four imperial arches composed of oak-leaves and acorns; the leaves containing seven hundred and twenty-eight rose, table, and brilliant diamonds; thirty-two pearls forming the acorns, set in cups containing fifty-four rose diamonds and one table-diamond. The total number of diamonds in the arches and acorns is one hundred and eight brilliant, one hundred and sixteen table, and five hundred and fifty-nine rose diamonds.

"From the upper part of the arches are suspended four large pendent pear-shaped pearls, with rose diamond cups, containing twelve rose diamonds, and stones containing twenty-four very small rose diamonds. Above the arch stands the mound, containing in the lower hemisphere three hundred and four brilliant, and in the upper two hundred and forty-four brilliant; the zone and are being composed of thirty-three rose diamonds. The cross on the summit has a rose-cut sapphire in the centre, surrounded by four large brilliant, and one hundred and eight smaller brilliant.

"Summary of jewels comprised in the Crown:—

| | |
|-------------------------------------|---------------------------|
| 1 Large ruby, irregularly polished. | 1,363 Brilliant diamonds. |
| 1 Large broad-spread sapphire. | 1,275 Rose diamonds. |
| 16 Sapphires. | 147 Table diamonds. |
| 11 Emeralds. | 4 Drop-shaped pearls. |
| 4 Rubies. | 273 Pearls. |

Here is a gorgeous array of jewellery! a recapitulation of precious stones that more than realises the dream of an Aladdin!

Here's rubies of Bengala, rich, rich, glorious!
These diamonds of Olfiana,
Vented at the price of prince's raimens,
How bright they shine, like constellations!
The South Sea's treasure here, pearls, fair and orient,
Able to equal Cleopatra's banquet.

The jewels of the British Crown by their richness, purity, and value, are symbolical of the wealth, power, and greatness of the British Monarchy. So regarded, it is impossible not to feel that the most fitting emblem of the mightiness of the Imperial dominion of England is still wanting to the Crown jewels—and that is the Koh-i-noor. The most marvellous of all diamonds—the product of the East—became the spoil of England a few years ago. Previous to the incorporation of the East Indies with the British Crown, the Koh-i-noor would, however beautiful, have been a mere extraneous ornament. Now, however, it would be the representation of a fact; and the East-Indians are the direct subjects of the English sovereign, so should their magnificent diamond form "the most precious jewel in her Crown."

NECROLOGY OF EMINENT PERSONS.

LADY SOUTHAMPTON.

On Tuesday, 22nd October, at Whitebury Lodge, Northamptonshire, of paralysis, after a lingering illness, the Right Hon. Harriet Baroness Southampton, only daughter of the Hon. Henry Fitzroy Stanhope (2nd son of William, 2nd Earl of Harrington), by Miss Eliza Falconer. Her ladyship married, February 23, 1826, Charles Fitzroy, third and present Baron Southampton, by whom she leaves no issue.

LADY DOWNES.

On the 18th of October, at her residence in Grafton-street, aged 61, the Right Hon. Christophena, second wife of Ulysses de Burgh, Baron Downes, of Athenaville, in the peerage of Ireland. Her ladyship was the only daughter of the late James Buchanan, of Bath, Esq., and relict of John Fleming, of Stomham-park, Hants, Esq., after whose decease, at Athens, in July, 1844, she married, August 4th, 1846, present General Lord Downes, K.C.B., and K.T.S., by whom she leaves no issue. Her eldest son by her first marriage, John Willis Fleming, now of Stomham, Hants, Esq., married the Lady Catherine Cochrane, daughter of the Earl of Dundonald.

EAL MANVERS.

On Saturday, October 27th, at Thorbury Park, near Olberton, Nottingham, in the 83rd year of his age, the Right Hon. Charles Herbert Pierrepont, Earl Manvers, Viscount Newark, and Baron Pierrepont of Holme Pierrepont, in the peerage of the United Kingdom. This venerable nobleman was the third son of Charles 1st Earl Manvers, by Anne Orton, daughter and co-heir of William Mills, of Richmond, Esq., and was born August 11th, 1774. He entered the Royal Navy; but on the death of his eldest brother, Evelyn Henry, without issue (his second brother, William Evelyn, born 1777, having died previously, at the age of 10), he quitted the service by desire of his father, and from 1801 to 1816 represented the county of Nottingham in Parliament. In the latter year, on the decease of his father, June 17th, he succeeded to the earldom, having married, August 23rd, 1804, Mary Letitia, eldest daughter of Anthony Hardolph Eyre, of Grove Park, Nottingham, Esq., and whose death we recorded only a few weeks ago. The loss of her ladyship on the 7th of September last, after a happy union of fifty-six years, affected seriously the earl's health, and he gradually declined from that day. He

is succeeded in his titles and estates by his only surviving son, Sydney William Herbert (misprinted Robert in our notice of September 15th), Viscount Netley, M.P., born 12th March, 1825, and who married June 16th, 1852, Madie, Georgina Jane Elizabeth Fanny de Franquetot, daughter of Augustin, Duke de Coigny, by Henriette Dumast, formerly Hamilton, only daughter of the late Sir New Dalmayre Hamilton, Bart. and by her last husband, Sir Charles William Redey, born August 2nd, 1854 (now by courtesy Viscount Newark); the Hon. Evelyn Henry, born August 23rd, 1856; and a daughter Lady Emily Anson Charlotte, born in 1853.

WILLS AND BEQUESTS.

James Carrick-Moore, Esq., of Corwell, Wigtonshire, N.B., and of 11, Grafton-street, in Chelsea-street, Piccadilly, died in London, on the 1st June last, at the age of 86, made his will in the Scotch form in 1840, and there are five codicils adapted to the English form. The will and codicils were proved in London, on the 24th of October, by his son, John Carrick-Moore, Esq., the sole executor; the personal property in the United Kingdom being sworn under £60,000. The testator, in 1852, succeeded to the estates in Wigtonshire, under the will of Robert Carrick, Esq., whose name he thereupon assumed, and which property now descends to his eldest son and heir, John Carrick-Moore, to whom he has bequeathed all the farming stock, carriages, horses, and implements of husbandry, he paying over to the testator's estate a sum of £25,000, which is to form part of the residue. His youngest son, Graham Francis, having succeeded to the estates and property of Mrs. Mitchell, of Witharn, the testator considered him amply provided for, and has merely given him a token of regard. To the three other sons he left the whole of the residue, equally amongst them. There are several legacies given to friends, and the testator has kindly remembered all his servants; to his butler he leaves an annuity of £40. This venerable gentleman was the brother of the celebrated General Sir John Carrick-Moore, who fell at Corunna, after bravely conducting the retreat of the British army, in the year 1809, and whose life and character will elicit the respect and admiration of posterity. The gold watch of the lamented General, which was in the possession of the testator, he has bequeathed to his son and heir, who, no doubt, will always consider it as a valuable heirloom in his family. The testator was also brother to Admiral Sir Graham Moore, G.C.B.

Nicholas Westley, Esq., late of 79, York Gate, Regent's-park, who died on the 24th of August last, at the age of 79, and made his will in 1852, to which he added two codicils, dated 1855 and 1857, and appointed executors for England and Ireland; the executors for England being the Right Hon. Granville Augustus William Waldegrave, Baron Radstock, the brother-in-law of the testator; Thomas William Freeseur, Baronets, Esq., of Devonshire-place, Portland-place; the Reverend Frederick Bradwardine, the son-in-law; and Caroline Mary Estlin, daughter. The personalty in this country was sworn under £40,000. The executors appointed to set in Ireland are Edward Percival Westley, Esq., the son, and Marcia Keane, Esq., of Beech-park, Clare, the son-in-law. Probate was granted by the Lord Chancellor of the will of the testator, and of his codicils, to his wife, the Hon. Emily Susan Laura Waldegrave Westley, who was the eldest daughter of the first Lord Radstock, a life-interest in his funded property, and other bequests; and after her decease the property in England, with some few exceptions, is to be divided equally amongst his four daughters, his daughter Louisa Isabella Keane, wife of Marcus Keane, Esq., taking a share in the Irish estates. There are some specific bequests to his family, and to his executors and personal friends, and legacies to the poor. The testator, Nicholas Westley, Esq., who succeeds to the landed estates, married Elizabeth, daughter of the Right Hon. Francis Blackburn, formerly Lord Chancellor of Ireland.

Marmaduke Robert Langdale, Esq., of Garsden, Bitchingham, Surrey, and of Gower-street, Bedford-square, died on the 20th of September, and had made his will on the 5th of March preceding, appointing as his executors, John Robert Johnson, Esq., of Torrington-square, Alfred Langdale, Esq., the Rev. George Augustus Langdale (two sons of the testator), and Francis Stephen Clayton, Esq., of London, who duly proved the same in the London court, on the 25th of October. This gentleman died possessed of considerable property, both real and personal; the personalty being sworn under £120,000. He has bequeathed to his wife a life-interest in funded property to the amount of £25,000, a legacy of £200 immediate, all the furniture, plate, jewellery, pictures, &c., not otherwise disposed of; and after her decease the above principal sum will be divided into certain proportions amongst his three sons, and of each of whom he has devised separate portions of his estates in the counties of Suffolk, Essex. To the widow and children of his deceased son, Marmaduke Robert, he has left a legacy of £15,000, and there are bequests to his executors and others, and also to his servants. He seems to have possessed a vast store of curiosities. We noticed an initial cabinet of curious and antiquities, which he has left to his widow; medals of the kings of England, which he leaves to his son Alfred; a large casket of the Sacrifice to Augustus Caesar; a case of coins of the twelve Caesars, in gold, and a cabinet of minerals and shells. All these he leaves to his son George. There are also two horizontal cabinets of works of art, which he bequeaths to his son William. The residue of his estate, real and personal, he leaves to his three sons, in equal shares.

George Draper, Esq., late of 7, Park Village West, and formerly of Cambridge-place, both of Regent's-park, who died at his residence on the 10th of September last, had made his will on the 29th of September, 1858, appointing William Stanley Wright Vane, Esq., and Andrew Duncan, Esq., executors and trustees, who duly proved the same in London on the 16th of October, the deceased's personal property being sworn under £29,000. Mr. Draper has also considerable possessions in New Zealand, and was possessed of several estates. The whole of this property he has bequeathed in trust, and that the same may be sold, the proceeds to be invested in good and sufficient securities, the profits and income emanating from which are to devolve to his widow for life. He also left her an immediate legacy of £500, together with the furniture and all other miscellaneous effects absolutely; and at the decease of his relict, the property so invested is directed by the testator to be distributed in certain proportions amongst his seven children, consisting of four sons and three daughters.

William Lloyd Gibbs, Esq., late of Belmont, in the city of Bristol, died on the 27th of August last, and had executed his will on the 3rd of November, 1857, and therein appointed as his executors, the Rev. Frederick Earle Freeman, and Henry Hucks Gibbs, Esq., and the testator's brother, Probate was granted by the London court, on the 26th of October; the personal property being sworn under

£14,000. After making a few bequests to personal friends, and to his executors, and legacies to the following charitable institutions, namely, the Society for Free-mission Christian Knowledge, the Propagation of the Gospel in Foreign Parts, the Employment of Additional curates in Populous Places, and the Church Vestimentary Association, to each he has left the sum of £100; and a sum of £300 for the purchase of endowments for the poor in the parishes of St. Andrew, who leaves the residue of his property to his brothers, Charles Gibbs, and John Lomax Gibbs, and his sister, Mary Dorothea, wife of G. E. Adams, Esq., barrister-at-law, in equal proportions.

Major-General the Hon. Henry Frederick Lookyer, G.B., K.E.L., late Commander-in-Chief of the forces in Ceylon, and acting Lieutenant-General of that island, was formerly residing at Brumpton, Kent, but died at sea, on his passage homeward, from Ceylon, on the 20th of August last, at the age of 64. He made his will in the year 1825, in which he signs as Captain 2nd Fusilier Buffs, and has not since altered it. He therein appointed as his executors Mr. Sergeant Mowbray, who has declined to act, and Robert Carr, Esq., of Gosport, since deceased. Administration with the will annexed was thereupon granted to his relict, who is the sole legatee, the whole of the property being left to her, his daughter and only child having died long prior to his death. The personalty sworn to in this country was estimated for probate duty at £55,000.

Reviews of Books.

JINGLE.*

If the shoals of poets, who at this season of the year begin to spawn verse with alarming fecundity, cannot be compelled to write sense, they ought to be repressed by some special enactment from the Legislature. The poetical jingle is a rhyme. The High Court of Criticism should be invested with a summary jurisdiction over literary impostures, and empowered to brand all spurious articles with some known and accredited stamp, as the authors of them were authorized to brand false weights and measures. Where is the difference? The grocer who passes you off sherry for coffee, or the victualler who fills your head with the fumes of logwood, when you innocently believe you are savoring your judgment at the shrine of old port, is not a wretch more fraudulent than the ingenious gentleman who endeavours to deceive you into the notion that he is savoring you up a book of poetry, when, in fact, it is only very bad verse, or mere prose all the time. The only conceivable apology for such an attempt at deception, is that the gentleman may be deceiving himself alone. He may not know any better. Hard as it is to credit, he may possibly think that his prose becomes transformed into poetry by being broken into lengths and tagged with jingles. He may have a theory of his own upon that subject, and, suspicious as the circumstances look, he may be as honest in his vocation as the best of us. There are men going about now who imagine themselves poets, and who are not poets for all that, and the interests of society are concerned in the declaration of the fact.

Now here is a pretty little volume, with a name on the title-page known to us in connection with some passages of true poetry which we have not forgotten, and which had a promise in them of something more. The ripeness and richness of Mr. Corventy Patmore's early poems suggested an expectation that he might in time become matured into a thoughtful singer, with a touch of the energy and quick sensibility that help to form real poets. There were great signs of this in the very grain of the first volume. The imagery, occasional colouring, a tendency to rush into strange passionate excesses, vague yearnings after something unattainable, and morbid sorrow for something that, probably, never was lost. But the longing for May-moons, the imaginary heart-cries, and the thousand and one conflicts with appetitions, brain-frores were the mere dreams of the youthful muse; and when she should have awakened to a broad daylight consciousness of the world as it is, we anticipated verses worth the hearing. Whether she was wide awake when she inspired this little book we will not venture to inquire; but certain it is, that, instead of growing more grave and mellow, solid and full of matter, with a grand sweep of music to give the proper divine expression to her utterance, she appears to have degenerated into a common stammer, to have lost all her fine, warm enthusiasm, and to work compile with just as much indifference to their structure or fitness as school-girls to the morals of their romances.

The volume contains one piece—a story. The whole plot, no plot, may be put into two lines. Graham dies in love with Honoria; Honoria marries Vaughan; Graham marries Honoria; and Honoria dies. Vaughan marries Honoria. It is not much to tell, and might pass if it were told through an appropriate vehicle. But this is just the question at issue between us and that detestable young man of Mr. Patmore. The experiment of building up novels in the shape of letters from different persons pursuing the action, through it was attempted by successful and skilful writers, is confessed on all hands to have failed. Yet, if the epistolary form could be employed anywhere with any hope of success, it must have been in the novel, which pretends to be a redaction of actual life in its most familiar aspects, and which, in writing, is giving prominence to the most trivial, the most unimportant, and even unimportant, on the novel, what is to be said of its introduction as the medium of a metrical tale of modern society? Think of Graham writing a full account of his love for Honoria, and his disappointment, in epistolary letters to his mother, and his mother answering thereto in a similar strain. The nature of the confession makes it occasionally rather an odd confidence, considering the quarter to which it is addressed, as when, for example, he hears of Honoria's marriage, and tells his mother what a "Voice" has commanded him to do by way of consolation:—

"There's nothing but one woman's loss,
And lightens life's eternal cross,
Like trying in mother's breast."

There is a little superfluity in the quatrain. The meaning would be simplified by the omission of the second and third lines, which merely dazzle the eyes of the reader, without conveying the faintest intimation of an idea to his mind. This is not an unsuccess in writing with Mr. Patmore's muse. She seldom comes to the point without a great show of words.

We have less concern at present, however, with her verbal luxuriance than with the shape into which she has fashioned it. Here is a specimen of what is intended to be in this volume as good poetry. Mr. Graham is writing to her son, who is about to enter the navy:—

"For your sake I am glad to hear
You sail so soon. I send you, Dear,

* Faithful for Ever. By Corventy Patmore. London: J. W. Parker & Son.

fire. They are in two groups; the one decrying the blackness and severity of the south, the other its cheerfulness and joy. The first group consists of soprano and tenor, the second of alto and basses; they sing sometimes alternately and sometimes together, joining at the close in a full and resonant strain of harmony. This design gives even for fine musical contrast; and this double chorus is admirable for skillful construction and happy effect. The chorus is followed by a romance, or ballad, for a soprano voice, "Christmas Comes," a sweet and simple song, full of natural and appropriate feeling.

The next piece is a cantata, in which it is a chorus of blessing on the noble house, of whom the assembled rulers are the vassals or dependents. The theme is one of the old Christmas carols, which have been familiar in England for ages. This antique melody, after being sung in unison by the voices only, is repeated several times with varying effects of harmony and orchestral treatment, of the utmost beauty, and in perfect keeping with the simple solemnity of the original strain. The company now get into a merrier mood. They call in chorus for "a tale," and after a prelude to the fine old tune of "Green Sleeves," a male voice sings a tale about the good King Alfred, who, having in the midst of his own necessities relieved the wants of a venerable pilgrim, is rewarded for his pious charity by a victory over the Danish foe. This ballad, with the chorus at the end of every verse, is exceedingly pleasing and interesting. "There is next a duet for the soprano and contralto, 'Little children, all rejoice'—a perfect gem of sweetness and expression. Lastly comes the finale, a largely-developed movement, descriptive of the festivities of our old English Christmas.

MUZURKA.*

FREDERICK CHOPIN must be ranked among the celebrities of the age, though his celebrity is more nominal than real. Among the musical public his name is known to everybody, while those who know anything of his works are comparatively few. A native of Poland, he acquired in his own country the knowledge of his art, and inherited that love for the Polish national music which shows itself in all his compositions. As an early age, but with an already distinguished name, he arrived in Paris, which became his chief residence during the rest of his life. He never became personally popular, even among his own musical brethren, from whom he seems to have estranged himself by his eccentric and wayward disposition. The same cause prevented his appearing in public, or mingling in general society. But he became the idol of a limited circle—who might almost call it coterie—consisting of ladies distinguished by their rank, talents, and accomplishments, who were captivated by his wit and manners, and worshipped his genius. It was not for the public, accordingly, but for these aristocratic admirers, that (with very few exceptions) his compositions were produced. They were essentially *salon* music, so exquisitely refined and delicate, and so peculiar in style, that it required his own performance, or that of a few of his intimates who thoroughly understood him, to give complete expression to his conceptions. Nevertheless such is the originality and beauty of many of them, and such a charm do they derive from their Polish nationality, that they have gained the admiration of the most accomplished lovers of the piano all over Europe.

To such amateurs the edition of Chopin's most delightful and characteristic works, given to the public by Boosey, will be heartily welcome. It comprehends the eleven sets of mazurkas collected separately during Chopin's life, and is enriched with a preface written from the pen of Mr. J. W. Davison, with that gentleman's usual sound judgment, critical acumen, and lively sense of style, in which it required his own performance, or that of a few of his intimates who thoroughly understood him, to give complete expression to his conceptions. Nevertheless such is the originality and beauty of many of them, and such a charm do they derive from their Polish nationality, that they have gained the admiration of the most accomplished lovers of the piano all over Europe.

"His *mazurkas*," says Mr. Davison, "his preludes, his *polkas*, his *nocturnes*, and, above all, his *mazurkas*, are more anxious to move him from his seat, whenever he may eventually become of his concertos and sonatas. The variety with which, in the mazurkas, he has said the same thing some fifty times over, will go farther than anything else to prove that Chopin's genius, whatever its eccentricities and failings, was decidedly creative. The best of his mazurkas are, without question, those that speak least strongly of the lamp; those which have been in the least affected manner are easiest to play, and bear the closest affinity to (in some cases are almost echoes of) the national dance-tunes of his country. Some of them are, even as fastidious as they are attractive, from whatever point of view regarded; others, more violently laboured, are less happy; but not one of them is wholly destitute of points that appeal to the feelings, surprise by their unexpectedness, fascinate by their plaintive character, or charm by their ingenuity."

SONGS.†

THIS publication, which is in two volumes, contains twelve vocal pieces, selected from the works of the great masters of the schools of Italy, Germany, and England; Handel, Gluck, Mozart, Verdi, Schubert, Mendelssohn, and others of the older time. They are all drawn from sources not generally accessible—such as the Italian opera of Handel, an exhaustive mine of vocal treasures—and are consequently little known; a circumstance which enhances their interest and value. Their selection gives the fair reader's taste and culture, as their arrangement and preparation for modern use show her artistic skill. Miss Mason has long stood in the highest rank of her profession, as an accomplished instructress, who, by her successful labours, and the influence she enjoys in the highest circles, has done as much as any of her contemporaries in promoting a pure taste, and in withstanding (a difficult task) the incessant encroachments of fashionable frivolity in music.

CLASSICAL COMPOSERS.‡

THE purpose of this publication is similar to that of Miss Mason, which we have just noticed; the difference being that the one is for singers, and the other for pianoforte players. Of all the difficulties which the teachers of this instrument have to encounter, the greatest is to counteract the penchant of their pupils for the showy fireworks piece of a day; and to inspire them with a taste for the music of the great masters. A young lady will undergo an amount of labour in order to accomplish those feats of manual gymnastics which are the signposts of our fashionable drawing-rooms, while she can scarcely be persuaded to study those works which, however great and beautiful, are not calculated to gratify the love of display. Much of this happens because our fair and youthful pianists don't know any better. They are led to imagine that our Handels and Haydens, and Mozarts and Beethovens, are clumsy ennobled old gentlemen,

* The *Mazurkas of Frederic Chopin*. Edited by J. W. Davison. Boosey, 4 songs for the Classical Vocalist. Edited and arranged by Elizabeth Mason. Leader and Cook.

† *Evenings with the Classical Composers*: being selections from instrumental works not generally known to pianists. Arranged for the pianoforte by Edgar Adams. Cooks & Co.

whose acquaintance they do not choose to make. Let them be undeceived, nevertheless; let those antiquated bargains be properly introduced to them, and, if they have taste, feeling, and a love of what is really great and beautiful in art, they will soon come to a different way of thinking. With this view Mr. Edgar has presented them with a collection of short pieces, extracted from the works of the great composers, so attractive that it is impossible to play or hear them without delight, and so easy in comparison that they will not cost a tittle of the labour thrown away in learning to scramble through heaps of unmeaning jargon. In truth, every pianist who has a taste for the music of the great masters, and who has not been so valuable to the student, but acceptable to the most accomplished performer.

THE LOST JEWEL.

LONG ago, ah, long ago!
I lost a jewel of great worth
Than the loveliest lady of the Earth
Could hang on her bosom as white as snow,—
Or any Emperor should'd with mine
Could place on a maiden's finger fine
And say, "Beloved, be thou mine!"
Long ago, ah, long ago!
I lost it wondering to and fro,—
Fainter and purer, brighter far
Than the Morn or Evening Star.
Could I make it mine again,
To clasp it—hold it—and retain,
I'd be greater than the king,
Richer than the bloomy spring.
And where I lost it well I know—
Still cannot trace it,
Or wealth replace it,
Or anything else this world can show,—
The jewel so bright,
My heart's delight,
Lost in another's heart long ago,—
My richer than I, I,
My prouder of mind,
Lost for ever! ah, long ago!

LITERARY INTELLIGENCE.

Messrs. Longman have some important works in preparation. Among them are "The Constitutional History of Great Britain from the Accession of George III. to 1760–1860," by Thomas Erskine May, of the Middle Temple; Vol. I. Part I., of "Collected Archaeological," containing collections relating to the antiquities of Shropshire; and "Port Royal," a contribution to the History of Heligian and Literature in France, by Charles de Montaigne, which will contain the early history of Port Royal, the Jansenist Controversy, the Provincial Letters, and the history from the peace of the Church to the final suppression of the community. The new novel, entitled "Lavinia," by the author of "Doctor Antonio" and "Lorenzo Bononi" will be published by Messrs. Smith & Elder during the ensuing month.

Messrs. Blackwood announce an authorized translation of "The Monks of the West," by the Count de Montalembert; "The Punjab and Delhi, in 1857," being narrative of the measures by which the Punjab was saved and Delhi rescued, during the Indian mutiny, by the Rev. J. Cave Brown, Chaplain of the Punjab movable column.

Messrs. Edmonston & Douglas, of Edinburgh, are preparing the following new publications:—"Memoirs of his own Time," from 1741 to 1814; by Thomas Ross, Esq., D.D., minister of Jedburgh. "Athena, or Notes of an Embassy to the Island of Inchekeith," by J. Y. Simpson, M.D., Vice-President of the Society of Antiquaries of Scotland. "Characteristics of an old Church Architecture, in the Mainland and Western Islands of Scotland," by T. S. Mair. "The Story of Burnt Nal,"—a translation of the "Njal Saga,"—with an Introduction, Essay, by G. W. Pasant, D.C.L. "Rais and his Friends," with illustrations by George Hervey, R.S.A., and J. Noel Paton, R.S.A. And a new volume of the "Reminiscences of Scottish Life and Character," by J. H. Barnum, Dean of Edinburgh.

A new "Quarterly National History Review," for January, Bishopsgate, is announced to appear at the beginning of the new year, published by Messrs. Williams & Norgate. A good list of names—men famous in science—are mentioned as contributors, and the contents of which the *Panthea* was saved and Delhi rescued, during the Indian mutiny, by the Rev. J. Cave Brown, Chaplain of the Punjab movable column.

Mr. Harrison Ainsworth is at work on his old ground. On the 1st of January will be commenced "The Constable of the Tower," an historical romance; illustrated by John Gilbert.

Mr. James Blackwood has the following works in preparation:—"Ismael and Casseador; or, the Jew and the Greek;" "A Novel Journal;" of what passed in the Temple Prison during the captivity of Louis XVI., King of France, by M. Cléry, the king's valet; and "Cobles in Search of a Cook."

The new volume of the *Encyclopædia Britannica* will contain original articles on "Tannin," by Mr. Wm. Wessinger; on "Theatres," by Dr. Doran; on "Turner," by Mr. Walter Thornbury; on "Voltaire," by Mr. Henry Rogers; on "Wellington," by Mr. Russell, the correspondent of the *Times*; on "Washington," by the Hon. Edward Everett; and on "Wine-making," by Sir James Esmereson Tennant, K.C.S., LL.D.

Mr. Alfred W. Bennett has now nearly ready a "Narrative of Ten Years' Imprisonment in Prisons of England," by Anthony Nicoll, a police officer. Also "Will Adams, the First Englishman in Japan; a Romantic Biography," by William Dalton.

Mr. Holgrave, of Fleet-street, will commence a four days' sale of valuable books on Tuesday next, November 6th. This collection, the property of a collector, is remarkable for a very rare collection of old and valuable Bibles. Among the lots may be noticed a complete set, 55 volumes, of the Parker Society's Publication.

The following comprises our Foreign Literary intelligence:—Messrs. H. K. have just issued a French translation of "Jean Eyre," by Madame Leobasles-Souverre, for their library of Foreign romances.

Dentu has put forth a book by the Chevalier Gougenot des Mousseaux, on "Maggio

NOTICE OF REMOVAL from 3, OLD BROAD STREET, to 10, CONNELL, R. THE RAILWAY PASSENGERS ASSURANCE COMPANY insures all Accidents, whether Railway or otherwise. An Annual Payment of £1000 FINE at death from Accident, or £50 weekly from Injury.

One Person in every Twelve insured is injured yearly by Accident. No extra Premium for Volunteers. For further information apply to the PROTECTIVE OFFICE, the RAILWAY STATION, or to the Head Office. This Company without issue has paid for compensation £25,000.

Railway Passengers Assurance Company, Office, 10, Connel, E.C. 10th.

STATE FIRE INSURANCE COMPANY. Chief Office, 5, Lombard-street, and 3, Pall-mall, London. Capital half-a-million.

Chairman—The Right Hon. Lord KRAKE. Managing Director—J. B. HENDERSON, Esq. New Premiums for the year ending 31st March, 1860:—£220,650 £ 0 0 Total previous income for the year ending 31st March, 1860:—£470 5 0 Agents Wanted.—This Company not having any life business, the Directors invite agents writing only for life companies to represent the Company for fire, plate-glass, and accidental death insurance, to whom a liberal commission will be allowed. | 13.—In Mahogany Case, Five Octaves, Fourteen Stops (Tremolo) Four Rows of Vibrators | — | — | — | — | 37 |

WITH THE PATENT PERCUSSION, OR PIANOFORTE HAMMER ACTION.

The invention of the PATENT PERCUSSION Hammer has entirely removed the sole objection to these admired instruments—want of rapidity of articulation when used for Pianoforte Music. It consists of a set of Hammers which strike the Vibrators at the same moment that the air is admitted, thus facilitating the execution of the most brilliant and rapid passages, and also producing a fuller and very superior quality of tone, and imparting to this instrument all the advantages of the Pianoforte.

| | | | | | |
|--|---|---|---|---|-------------|
| No. 14.—In Mahogany Case, Three Stops, One Row of Vibrators | — | — | — | — | 20 Guineas. |

THE LONDON REVIEW

AND WEEKLY JOURNAL

Of Politics, Literature, Art, & Society.

CONDUCTED BY CHARLES MACKAY.

No. 19.]

SATURDAY, NOVEMBER 10, 1860.

[PRICE 3d.]

RIGHT AGAIN.

THE two famous despatches which Lord John Russell addressed, on the 31st of August to the British Minister at Turin, was of a nature not only to damage his political character, but to lessen the popularity, and impair the usefulness of the Administration. Whether the document was penned at the instigation of others, or was due to the promptings of his own mind, is a mystery, and such it will doubtless remain. But such mischief had it done, and such uneasiness had it created, lest there should be a design in high quarters to hook Great Britain into an unholy Northern alliance for the support of Austria in Venetia, that the friends and opponents of the Government alike deemed it imperative upon Lord Palmerston either to explain the meaning, or to disavow the intentions of his colleague. In this journal of the 27th ult., in speaking of the Warsaw Conference, which has since so happily proved abortive, we denounced the policy indicated in the despatch, and called upon Lord Palmerston to speak out in such a manner that there might be no further misunderstanding on a matter so vital.

Lord Palmerston went on his Yorkshire tour, addressed many public meetings of his admiring countrymen on all sorts of topics, but never said a word about foreign politics. Our buoyant Nestor, our hearty *Maachiavelli*, our ever gallant and popular Viscount, was right. He had been behind the scenes in the Foreign Office, and knew that his colleague had written, or was about to write, a second despatch, which would repair the mischief of the first, and place the Government once again, with respect to its foreign policy, in unison with the reason and the sympathy of the people. The same pen that had done the foolish thing was charged to do the wise one; and leaving it to its functions, the Viscount expatiated on the blessings of education; disputed Pope's luckless assertion of the dangers that attend a little learning; and in every way conducted his tour as if all Europe were in a state of happiness, prosperity, and peace, and as if there were not the smallest speck of a cloud on the political horizon at home or abroad. This did, at the time, not appear to be the right course, but, as already said, Lord Palmerston knew what was coming; and last Saturday the town was startled by the publication of Lord John Russell's second despatch to Sir James Hudson on the affairs of Italy. Its substance was immediately flashed along the telegraphic wires, not only to Paris and Turin, but to every capital and court on the Continent, and to the camp of Garibaldi and Victor Emmanuel, as well as to that of the ex-King of Naples at Gaeta. Despatch number two was a thorough recantation of despatch number one. It recognized, in the most satisfactory manner, and with the most unimpeachable logic, the right of the Italians to manage their own affairs, declared the duty of Great Britain, and consequently of every other power in Europe, to hold aloof; justified the proceedings of Victor Emmanuel in the Duchies, in the Romagna, in Umbria, in the Marches, and in Naples; and withdrew from the unpopular and untenable position, that any power, except Austria herself, had, under any circumstances whatever, the right to do battle against an Italian King or the Italian people for the retention of Venetia. This is alike the sentiment, the conviction, and the policy of the British people; and Lord John Russell has expressed them all so well as to deserve approbation for the courage, as well as the completeness, with which he has rescued himself and his Government from a dilemma, which was inconvenient, to say the least of it, and which might hereafter have proved fatal.

We do not care to number ourselves among the critics who deem this second manifesto because it is inconsistent with the first. Those who prattle about mere consistency, as if it were the first of virtues, would make but poor administrators of public affairs, if unhappy circumstances ever floated them into power in a free country—or in any other. It was consistency that cost Great Britain the misery of the American and afterwards of the French Revolutionary War; and it was inconsistency that procured us the blessings that have followed Roman Catholic Emancipation, the repeal of the Test and Corporation Acts, and the abolition of the Corn-laws. To be inconsistent is no reproach to a statesman. To be consistent in wrong is the unhappy privilege of Lucifer and the fallen angels. Among men, and especially among statesmen, inconsistency is one of the greatest of virtues, if it be shown in the denial and abandonment of error.

The despatch was not published a moment too soon. Though it can have no influence upon the victorious arms of the King of Italy and his faithful general; though it can neither strengthen nor weaken his position with regard to the Two Sicilies, or the other provinces, duchies, and territories that by the will of the people have formed themselves both *de facto* and *de jure* into integral portions of his kingdom, it cannot but have an influence on the yet unsettled questions of Rome and Venice. That the present or any future Pope can, as a King, ever learn wisdom, is greatly to be doubted; but that the Emperor of the French, who has the Papacy in his grip, and who has tact and knowledge enough to be inconsistent, if it suits his purpose, will permit the question of the temporal sovereignty of the Pontiff to arouse the feeling of United Italy in growing hostility to France, and to weaken, at the same time, the increasing cordiality of the alliance between the British and French nations is to be doubted still more. At and after Villafranca, the Emperor proposed in good faith a scheme for the settlement of the Papal question. Events not to be controlled have borne the question far beyond the point at which it then stood; and while remaining the Pope's protector, as Head of the Church, and ceasing to be his protector as Head of a State—he will in due time be ready with a new scheme, that may combine justice to the Italians with the respect which Roman Catholics feel for the Head of their Church.

Austria has still one chance left to settle the ugly business of Venetia. Let her take advantage of it while there is time. There is no help to be got from Russia, as the Conference at Warsaw has proved. There is none to be got from the Germanic Confederation. There is none to be got from France, and none from Great Britain, whose supposed "interests in the Adriatic," dwelt upon in Lord John Russell's first despatch, have dwindled into nothing in the second. King Victor Emmanuel is already strong, and is daily growing stronger. He is the victorious and popular sovereign of a rich and powerful kingdom. To that kingdom the possession of Venetia is geographically, politically, socially, and morally an object of first necessity. The Italians and their King must and will obtain it. To avoid the wasteful expenditure of human life, and all the countless miseries and cost of war, they are willing to buy a province which they will some day or other be strong enough to take without purchase. Why, in the name of expediency as well as of common sense, should not insolvent Austria make the best of a bad business, and heal her wounded dignity with the gold that Italy would pour into her lap with ungrudging alacrity?

DUNDONALD AND NAPIER.

THE country has recently lost two of its greatest naval heroes. They resembled each other in their lives, and they are united in death. The Earl of Dundonald—to speak first of the one who died first,—so much better known as Lord Cochrane, performed all his great achievements in a subordinate capacity. The war came to an end before he could reach the highest rank of his profession; and as a great admiral he only, in latter times, sailed between the West Indies and North America. From entering the navy till he ceased to be employed, in 1809, only sixteen years elapsed, and during two of them he lived in retirement. In the six first of them he was learning his profession, or practising its ordinary duties, without much distinction. Eight years, therefore, of incessant activity, two before the Peace of Amiens and six afterwards, sufficed for the performance of those gallant actions which made him one of our greatest naval heroes. The capture of a vast number of the enemy's vessels, the destruction of many batteries, and the harassing of the French on almost every point of their coast, from Hieres to Dunkirk, are amongst his achievements. It was, however, as the commander of single ships, or of one or two frigates and brigs, that his services were performed, and never till the Basque Roads affair he was intrusted, and then under an admiral, with the command of a squadron. He was, in truth, a young officer and a young man when the difference which ensued between him and the Admiralty caused him to be laid on the shelf, and deprived the nation of his valuable services. His career is one of the most instructive episodes to be found in the history of the navy.

The son of a peer and the nephew of an old captain, the usual time of a midshipman's servitude was assigned to him by his name being borne on the books of a line-of-battle ship. While, however, other gallant youths had to wait and pine many years before securing a first commission, he was made a lieutenant before he had well time to learn, though acute and diligent, the names and uses of every part of a ship's furniture. By the end of a midshipman's usual probation, he had become a captain, though the first vessel he commanded was necessarily a small one, such as in those days were usually intrusted to commanders. She was, at the same time, very acceptable to him, as affording the earliest vacancy in which his friends could thrust him. In the little *Speedy* he gained a great reputation, and crowned a number of gallant actions by capturing a Spanish frigate, *El Gamo*, twice as big as his own brig. For this he received his post rank, but after some delay and some chattering with Lord St. Vincent, which marks the beginning of a different career from that of a fortunate sailor. Before the conclusion of the war the *Speedy* was captured by a French squadron, and, though he was speedily released, he remained unemployed for two years. Then again he entered into activity, and achieved, especially on the coasts of France and Spain, many triumphs. He was an officer of great skill, renowned for inventions in the art of naval warfare, as well as dashing courage, and was selected by the Admiralty, in 1809, over the heads of several officers of superior rank, to attempt the destruction of a French fleet in the Basque Roads. It was not entirely successful. He threw the blame of the failure, not justly, on Admiral Gambier; and being then in Parliament, representing Westminster, went fiercely into opposition, and quarrelled with the Admiralty. The Board, as usual, for the maintenance of discipline supported the "superior officer"; it was rebuffed by those whom Lord Cochrane had overshadowed, and he became the object of official hatred and official vengeance, none the less envenomed by the fact that he was one of the aristocracy, and had, in his early promotion, fully shared in all the advantages of the system he denounced as a politician.

His early promotion, too, by the favour of his uncle and Lord Keith, was thought, we believe, by the Earl of St. Vincent to trespass on his official patronage, which was probably the cause of the great admiral slighting the young captain, who was not of his own nomination. From Lord Cochrane's autobiography it is certain that there was a conflict between them, the memory of which was probably recorded in the black books of the Admiralty, and was remembered in 1809. Several attempts, we learn by the second volume of the "Autobiography," were made to seduce Lord Cochrane to be silent about Admiral Gambier, and acquiesce in the decision of the First Lord. To all these blandishments Lord Cochrane was insensible; the Admiralty was alike obstinate, and from 1809 the country was deprived of the services of one of the most gallant and enterprising of her many gallant and enterprising officers. The system which so suddenly raised Lord Cochrane as suddenly stopped his growth. The conflict betwixt him and the Board, at that time much more powerful than now, tended to his disadvantage. Unfortunately, the Government had an opportunity of taking revenge, and the embittered spirit of party led the Chief Justice of England to be the instrument of inflicting a heavy disgrace on one whom he might consider a renegade.

The family connections of Lord Cochrane were liable to suspicion. Some of the best of them were known to be grasping and unscrupulous; one had an actually tainted reputation. The noble lord had invested money in the Funds; he speculated too in them. In 1814 a sham officer pretended to land at Dover, bringing intelligence of the sudden

destruction of Bonaparte. The news caused a great rise in the funds. Lord Cochrane was said to have profited by the transaction; some of his friends did; the sham officer was traced to Lord Cochrane's house, where he changed his clothes; and Lord Cochrane, with others, were tried on a charge of conspiracy to defraud. His uncle admitted the charge by fleeing the country, and a jury, vehemently and partially instructed by Lord Ellenborough, who in the end regretted his conduct, found Lord Cochrane guilty. He was condemned to a heavy fine, to a year's imprisonment, and to stand in the pillory. The last part of the punishment was omitted, from a dread of the public, and the pillory abolished; but he was expelled from the House of Commons, dismissed from the Navy, and deprived of his knighthood. His eminent services were all forgotten by his enemies, and he became the victim of the system of which he had shared the advantages. His constituents showed their opinion of his conduct, and of the verdict by instantly re-electing him, till the reign of William IV. he remained excluded from the service. Then he was restored to the rank he would have held had he never been dismissed, and was a full admiral when he died.

The party animosities from which he suffered have passed away, and the Admiralty Board could not now commit the flagrant wrong that the First Lords of that time and their permanent Secretary committed on Lord Cochrane; but for many years he suffered as sore a trial as ever a noble spirit was subjected to. Since his restoration he has made several efforts to have the trial revised; but custom and law forbid, and the courts still retain the record of his conviction. Nobody now believes that he was guilty; though the charge obviously weighed on him till the day of his death. It appears from the second volume of his autobiography,* that his passing over from the service of the aristocracy is still remembered in high quarters, and the noble lord intimates that the Horse Guards have visited the sins of the father on the children, and refused to his eldest son, now the Earl of Dundonald, military advantages, to which he was fairly entitled. His early career, so suddenly cut short, and at a period when the country so much needed his services, illustrates more graphically than would many essays, the system under which the maritime resources of the country were then trifled with by men much deficient in the sense of moral responsibility.

It must be added that Lord Cochrane, possessing much of his father's inventive powers, was a mechanic and an improver. He was not only a quick-witted sailor, he was a man of genius. The estimate at present of the noble lord's character may be best ascertained from the fact that he is to be buried in Westminster Abbey. This probably he hardly expected; and it would have been a delight to him could he have been assured of receiving this high honour. For the public it will be a gratification. They will have done all they could to repair the wrongs of the most illustrious seaman, taking all his requirements into consideration, the country has given birth to since Nelson.

Sir Charles Napier resembled very much Lord Dundonald in the general features of his character. He, too, was well born; was active, enterprising, brave, greatly successful, and sometimes indisciplined. He had similar contests with the Admiralty. He, too, acquired more reputation as a young officer than after he had advanced in life. Both took service abroad; but Lord Dundonald fought emphatically for the cause of liberty, and was, perhaps, before the Italian war began, the noblest mercenary of modern times. Both became Members of the House of Commons, and conspicuous naval reformers. Napier was, perhaps, only less renowned than Cochrane from entering the service later. The individual enterprise which acquired for the last named his greatest fame, was less needed after Napier became a captain than in the early years of the war. Napier was, however, less unfortunate than Cochrane. His disputes with the Admiralty have exposed him to some retorts, and latterly, perhaps, may have precluded him from securing the command of a fleet, but they did not consign him to a forced inactivity in the very prime of his life. Sir Charles Napier's early history, though redolent of gallantry, was not so interesting as that of Lord Cochrane, and his later history is quite familiar to the public. We need not, therefore, recapitulate it.

The two veterans were admirable representatives of the glorious character of the navy during the war; that it has since deteriorated is, we trust, but a well-founded assertion. To keep pace with the general progress, the navy must change, and we hope, improve. But at present, it seems, from the solid armour in which ships are to be cased, and the vast mechanical power which is to be brought to operate in war, that personal gallantry—that dash and enterprise, the peculiar characteristics of the sailor—will heretofore be of less account than artistic and scientific skill. Should the national security and superiority become exclusively dependent on these and more on organization than on individual gallantry, we shall naturally

* "The Autobiography of a Seaman," published by Bentley, a book full of interesting details. We saw here a French book, which concerns the other naval hero just departed, and shows the conditions of our ships during the close of the successful war. (Sir Charles Napier, who has been a long time in the service, is engaged to write a history of the navy, and is now in the Admiralty, in view of his capture of the ship, informing their lordships that he will be back in the fleet, and will be a great asset and equipment. The American, however, showed off, and was in no condition to tell us.)

possess no quality in which others may not excel, and our naval superiority may come to an end. Our seamen must have new studies and imbibe a new spirit. In this sense the departure of the renowned veterans we have now referred to does but clear the way for new heroes and a different species of heroism.

THE BLESSINGS OF THE RAIN.

IT is the privilege of a true Englishman to grumble; and if there be one thing more than another about which he loves to grumble it is the weather.

"Heigho! the wind and the rain—
For the rain is rancid every day."

is the burthen of the song of one of Shakespeare's most amusing clowns; and from Shakespeare's day, and long before it, to our own, the same complaint, either as a jest or a lamentation, has been in the mouths of all the male and female gossips of every generation. A popular chorus of the children both in cities and villages, is—

"Rain! Rain! go away!
Come again north-e'ry day."

In *Exmoor* and the neighbourhood a well-known epigram asserts the plausibility that afflicts the people:—

"The West wind always brings wet weather,
The East both cold and wet together;
The North wind never brings in Rain,
And the South wind blows it back again."

An Englishman on the continent is known by his umbrella; and foolish Englishmen travel to the "sunny south" (very often only to languish and die), in order that they may enjoy a brief, and as they think a pleasant, immunity from the too constant drenching of the pitiless clouds that hover over the wulappery isles of Britain. That the summer has set in with its usual supply of rain, is a standing and a venerable joke. That the people on the western shores of England, Scotland, and Ireland, are well-forested, as well as those of Lincolnshire, is another ancient victim, which melancholy humorists are accustomed to hurl against the climate. St. Swithin is the most unpopular of all the saints in the Calendar, if a shower happens to fall upon the day which our Roman Catholic ancestors dedicated to his memory. And of all the summers of recent time, the ill-omened summer of 1860, which has just come to a watery and befitting end, will live in the memory of the present generation as the most pertinaciously and hopelessly wet which they ever knew or heard of.

But if it should turn out that all this wet is an advantage and not a disadvantage! That the showers and floods at which we make such dismal moan, are the greatest blessings that could befall us! That the constant rains not only fertilize our acres, and make our soil the freshest and greenest spots beneath the sun; but that they make our women more beautiful than other women, our men sturdier than other men, and add to the average length of life in every part of the country! Every traveller must have remarked the beautiful and perennial green of the British Isles as compared with the dingy brownness of the fields, meadows, and forests of continental Europe and America. It only requires a man to travel for a few months, either in the eastern or the western hemisphere, and to use his eyes in the interval, to come to the conclusion that the glowing bloom and beauty on an Englishwoman's cheeks last to a much later period of life than the bloom on that of an Italian, a Frenchwoman, an American, or of any other woman whatever, except the Welsh, the Scotch, and the Irish; and that a man at seventy in Britain is not so shrivelled and dried up as a man is at sixty in any other part of Europe, Asia, or America. A man in the United States of America is never appointed to a judgeship at seventy, or even at sixty-five; but in England a man at seventy is in the very prime of his judicial intellect, and Lord Campbell was upwards of seventy when he was made Lord High Chancellor.

So well do these facts and their causes begin to be understood, that the physicians of the United States recommend their fair friends and patients who desire to preserve the bloom of girlhood in their maturity and old age, to sleep in apartments ventilated by the introduction of steam. And physiologists assert that the climate of America is too dry and stimulative for the healthful activity of the Anglo-Saxon and Celtic brain, and the normal development of the race. But it remained for the Registrar-General of Births, Deaths, and Marriages, in his Quarterly Return just published, to give the world more convincing proofs of the value of rain as a healthful and life-preserving agent, than were ever before brought under notice. In 1859 the three millions of people inhabiting this metropolis were filled with the direst forebodings of pestilence, in consequence of the accumulating filthiness of the Thames; ruderly filthier than it had ever been by the unusual heat and dryness of the summer. In 1860 there were no such alarms. So constant were the rains that the Thames once more became almost limpid at Westminster, and, *mirabile dictu!* a few hardy salmon actually contrived in the wholesome waters so far up as Egham. In this pre-eminently wet summer the health of the country was so good, that the population of

England and Wales increased at the rate of 844 daily,—an increase which the Registrar declares to exceed any on record. And while the births were more numerous, the deaths were less frequent.

"The reduction of the mortality (we quote from the Report) is observable in the town and in the country districts; but is by far the greater in the town districts. The average number of deaths in the town districts during the summer of 1859-60 was 52,861; whereas the deaths in the last summer were 48,595, in the country districts during the same periods the deaths were 49,697 and 49,928. The rate of mortality in the town districts fell from 23.76 to 19.42 per 1,000; in the country and small town districts from 17.59 to 15.97; or 5.33 degrees in the town and 1.78 in the country districts.

"In London the mortality was low.

"The South-Eastern Division has been healthy, the deaths much below the average in every county. The deaths in St. Peter's, Brighton, were 30 below the average, and the district has been unusually healthy. The sewers have been well flushed and cleansed by the constant rains. In Kent, nearly every district was healthy. Portsmouth, generally an unhealthy place, has suffered less than usual. In Southampton, the mortality has been low.

"In the North-Midland Counties 5,858 deaths were registered, and in every county the mortality was below the average.

"The Eastern Counties have been healthy; the deaths, which were 6,153 in the previous summer quarter, amounted only to 4,566.

"The South-Western Counties, out of a population of nearly two millions, lost 7,071 by death; whereas the deaths in the previous summer quarter were 8,486. Every county—Wilt, Dorset, Devon, Cornwall, Somerset—enjoyed this immunity. Out of a population of about six hundred in Wilt, only one death occurred in thirty-two days.

"The decrease in the mortality of Wolverhampton, Walsall, West Bromwich, and Dudley, where the water-supply is abundant, is enormous; and in nearly all of them certain sanitary arrangements have been introduced. The deaths in Birmingham and Aston during the last three summer quarters have been 1,854, 1,815, and 1,241; the mortality has fallen one third part.

"It is probable that the ordinary water-supply of a place is bad when its mortality is greatly reduced by heavy rains.

"The North-Midland Counties lost less by 1,013 fires in the last summer quarter (5,154) than they lost in the summer preceding.

"In the North-Western Counties 13,969 deaths were registered, the deaths in the previous quarter having been 15,659. The system of *mildew* prevails in Lancashire, and the dirt is there not washed away by rain as it is in sewers, which may account for the circumstance that the reduction of the mortality is less in this county than it is elsewhere.

"The deaths in Yorkshire were 2,966, or less by 1,177 than the deaths in the summer quarter of the previous year.

"The weather of this quarter may be looked at as an experiment on the health of the people. Employment has been easily obtained by workmen, but the prices of provisions have been high. And this general survey seems to establish the fact, that the salubrity of the season is chiefly due to two circumstances; the reduced temperature of summer, and the abundant supply of water by rain. The low temperature retarded the putrefaction of the town impurities, and the water washed them away; so both the forces acting in the same direction, gave a great result. A careful study of the circumstances of each locality by which the result was produced, cannot fail to be instructive, and to confirm the faith of the authorities in the simple sanitary elements with which nature works."

We have quoted sufficient, we think, to make sensible people reflect, ere they again indulge in abuse of the weather of our islands; and what is of more consequence, to make them take timely measures to aid the beneficence of Nature by the establishment, in every populous town and city, of a cheap and copious water-supply;—to be most copious wherever the inhabitants are the poorest. That we should have abundance of water, not only for beverage and ablution, but for the constant flushing of our thoroughfares in dry seasons, would be true municipal wisdom, if the returns of the Registrar-General are to be depended upon, as we firmly believe they may be.

CONSTITUTIONAL SALT IN ITALY.

MEN usually speak of despotism and democracy respectively as good or bad systems, as their interests or prejudices may influence their perception. To the philosopher both these methods of government appear in theory equally good; it is the imperfection of human nature which prevents the complete success of either in practice. If, by a providential dispensation, all despots and their administrative functionaries were born good, despotism would be unexceptionable. If, on the other hand, all men were born good, what better system of government could be devised than a democracy? But as the majority of men have unalloyably more active evil than active good in their character, both schemes must be subject to continual and grave imperfection. What the despot, by elucubration and cultivated intelligence, may gain over the simple plebeian, he loses in the development by his position of that latent lust of oppression which is inherent in men. No reflective man would say that the autocratic countries of Europe are satisfactorily governed;—that is, so governed as to produce the greatest good to their inhabitants; neither that the people of any of those lands, though enjoying the most civilised on earth, are fit for absolute republican freedom.

Fortunately for us, in our own land the pernicious effects of the too

frequent incompetency of either individual rulers or collective peoples alone to carry on the functions of government justly and wisely have been almost wholly neutralized by combination of the two principles of liberty and authority. Here the fermentive acid of popular freedom has been gradually blended with the bitter alkali of monarchical rule; and the result is that harmless, healthful salt—a preventive of organic changes—which we call the British Constitution; an embodiment of order, that we may well hope is now as permanent as the salt in the ocean, and past all violent effervescence.

Despots and demagogues equally hate Constitutionalism; for with its establishment the occupation of each is gone. Hence the jealousy with which the Italian movement is watched by Austria and Russia, and even by Prussia and France, in both of which realms, and especially in the latter, the acid of freedom is not in sufficient quantity to neutralize the alkali of authority, and the true salient flavour is lacking. Hence, also, the late efforts of Mazzini and his followers to direct the current of popular enthusiasm in Naples, and to stimulate Garibaldi into a course of action to which Victor Emmanuel could not safely be accessory.

Were the Italians seeking to form a democratic republic, despotism would be less concerned. Were the Austrian autocrat reducing Italy once more to a shadow of his empire, demagoguery would have less reason for dissatisfaction than at present. In either case, the introduction of so much of one principle would prepare the way for a large influx of its opposite; much larger it would undoubtedly become than would be necessary to restore equilibrium. But in a constitutional kingdom, established under Victor Emmanuel, there would be no absorbent for Francis Joseph's alkali or Mazzini's acid. It may be objected, that the rights of legitimate princes must be sacrificed in the constitutional union of Italy; but so must the rights of rulers forfeited by the wrong of subjects. This is a doctrine generally received as touching the past; and the greatest obstacle to its application to the present is the existence of personal interests in the expelled princes and their followers, and of sympathy for them in those who have analogous interests to defend.

Why cast forth from Italy the preservative salt which has been gradually formed by comparatively small local agitations, when the introduction of pure despotism or democracy must eventually lead to a vast effervescence! In the love of domination in despots, and the hatred of authority in demagogues, so strong as to blind them to all necessity and expediency! Did they look beyond the gratification of their own propensities, they would see, on the one part, that Italy has grown too intelligent and self-reliant to submit to oppression; and, on the other, that men just escaped from tyranny are especially incapable of simple democratic freedom. Such arguments would be of little avail with the Emperor of Austria or the Agitator of Italy; for interest and prejudice form powerful barriers against the entrance of reason; but each of these men has sympathizers in England, and it would be well if these could be brought to see the question in a true light, so that this nation might be as one in the moral support of her sister Italy at the present important crisis.

TURKISH RAILWAYS.

THE daily papers have announced the opening of the first railway in Turkey. The line in question connects the Danube at Tchernavoda with the port of Kustendjie, on the Black Sea; and, considered as the commencement of a system of railways in that part of Europe, the event is worthy to be chronicled.

It seems a paradox to say, that in England we do not sufficiently recognize the importance of railways. For a century past our country has been intersected by good roads; for a period not much shorter we have had an extensive service of canals, and a generation now growing old has witnessed the completion of a network of railways. We hardly realize what our country would be without so perfect a system of transport.

Rivers, roads, and railways, are not in the true economic sense of the term "producers," but they are necessary to production. They are, in fact, the keys to unlock the storehouses. Any traveller in Eastern Europe must have been amazed at the undeveloped and unemployed wealth on all sides wanting little else than the means of transport. Take the Banat, Servia, and Wallachia. He will find mines of coal which are not worked; forests of valuable timber of which no use is made; a population paying enormously for salt, salt mines, but no means of transporting the produce; rich plains which it does not pay to cultivate. The keys are wanting for these storehouses; and in every interest, commercial, political, and social, they must be supplied.

These observations do not, in one point of view, apply to the Turkish railway to which we have alluded, that line being designed to accommodate the existing traffic on the Danube. The freedom of the Danube navigation was one of the important results of the Russian war. It is secured by the Treaty of Paris, into which stipulations were introduced with a view to the establishment of works for deepening the mouth. Unhappily, nature is less tractable than diplomatists, and the Salina has refused to be improved. A con-

siderable sum has been spent there, without demonstrating anything except the folly of spending more. There is no instance in the world of a river which discharges itself into a tideless sea, having at its mouth a channel unimpeded by bars or shoals; and no works of ancient or modern times have ever removed such defects. The navigation of the Danube mouths was, and ever must be, dangerous and difficult. The next best thing to improving the navigation is to avoid it, and this is accomplished by the Danube railway. A line of forty miles connects the river and the sea, and escapes the delta.

The terminus on the Black Sea is Kustendjie, the place of Ovid's banishment, the ancient Tomi, afterwards Constantia, of considerable importance under the Lower Empire, frequented by Genoese and Venetian traders, destroyed in 1828 by the Russians, and now undergoing restoration at the hands of an English company.

We rejoice that the completion of the first Turkish railway is due to English enterprise. Many of our railway magnates are engaged in it, and the name of the chairman, "Cunard," almost represents the perfection of ocean travelling.

It is hard to say what will be the ultimate result to Turkey of industrial enterprises of this description. Though it may be too much to expect that they will solve the vexed Eastern question, and "cancel and tear to pieces the great bond," may they not postpone the solution of the difficulty till another generation, with other and better means to deal with it, has appeared upon the scene?

THE WAGTY PHILOSOPHER.—No. XVIII.

MR. GAUTTIE ATOMS HIMSELF TO BE A SAVAGE.

THOUGH I wear hat, coat, and trousers,—though I blend myself in all the paraphernalia of civilization, and conform, as far as I must, to its laws and observances, I am a Savage. Nature will out. There are times when civilization sits so stiffly upon me that I feel it like a shackle; times when my soul revolts against its restraints, and when I long to rush forth into the wilderness, and act in all respects as if I were the "noble Savage" which, at heart, I know myself to be. What is more, I glory in my barbarism, and assert that every man must not only possess but should encourage a large amount of this aboriginal instinct, if he be good for anything. I feel, on such occasions, that I cannot always tread on carpets, eat with knife and fork, and breathe the over-heated enervating atmosphere of drawing-rooms and Houses of Parliament. It does not suit my ideas to be always prim and precise, to wear a dress-coat and white kid gloves, and to say "No, I thank you," when, if Nature had her will, I would say "Yes, and much obliged to you." It offends the savage that is in his bosom, to instruct my servant to say that I am not at home, when I am at home. It offends me even more, when I am compelled by the laws of polite insincerity and worldly diplomacy, to tell Mr. Snobisimus, in a bland and courteous tone, that I am glad to see him, when all the time I wish that he were in Kamashatka, or a hotter place.

Too much of civilization, like too much of anything else, is not healthy. Beef is good, but who would have beef, and nothing but beef, for breakfast, dinner, and supper, every day, and all the year round! Claret is a noble drink,—but to have claret in the morning, claret at noon, and claret at night, and nothing but claret, what mortal man could bear! After a month or a week of such a course of drinking, pure water would be like the nectar of the gods,—a drink divine and precious, not too dear if it had to be purchased with a diamond for every drop that passed over the tongue.

I own, too, without any compunction, that there are moments when I am intensely indolent of clothes, and all the handiwork of tailors, hatters, shoemakers, and bootmakers. Am I never to feel the pure breath of heaven over all the surface of the temple in which my soul dwells, as Adam did in Paradise? Am I always to be in debt to my inferiors, and to "owe the worm silk, the beast hide, the sheep wool?"

Must I for ever be so trammelled by civilization as never to enjoy the luxury of a bath, unless I take it in a tub or a tank, or from a bathing-machine at the coast? Am I always to dry myself with towels? I desire to bathe in the mountain streams—far up amid the waterfalls—with no onlookers but the birds; and to sit in the sunshine until that and the breeze dry me quite as effectually, and far more pleasantly, than any piece of Manchester goods. I love to bathe in the sea, where there is nobody within five miles of me; to do desperate battle with the surf and the spray—to kick and buffet them—to sport, to frolic, and to plunge—and, when I have had enough, to walk myself dry upon the sandy shore, with as much freedom, and with as little indebtedness to civilization, or any of its forms and fashions, as the seaweed that dries over my head, or the seaweed that follows lazily amid the rocks and boulders at my feet. On such occasions I feel an amount of positive delight in the mere fact of my physical existence, and in the surpassing loveliness and beauty of Nature, that the forms and ceremonies, the pomp and vanities of civilization have never yielded me. Did ever you, friend reader, try the luxury of a natural shower-bath on a rainy morning, and feel the pelt—not of the pitiless, but of the delicious storm, upon your bare shoulders? Did you ever, as Edgar says in "King Lear,"—

"—all your hair but in knots,
And with prevented sunbeams sufficed
The winds and precarious of the sky?"—

allowing the cool, quick drops—fresh from heaven—to trickle over you, and caress you, and anoint you with health and joy! If you never did, you have a new pleasure before you; and when you taste it you will confess that the civilized shower-bath, fitted up in a room, with all appliances and means for your so-called comfort, is but wheezy Art, and a sorry substitute for breezy Nature.

And it is not only of sensations like these—which are both agreeable and wholesome—that our over-civilization deprives us. It is right, I ask you, that we should always be dependent for our personal security, or that of our waggon, upon the police constable and the magistrate, the judge, jury, and the hangman! Is it consistent with our manly dignity that for want of legitimate and proper use there should no longer be any vigour in our right arm, and no power for the endurance of cold, hunger, and fatigue? Is it well that there should be no sharpening of the physical faculties by physical danger? If the eye of the wild man of the woods sees further than mine, I begrudge him the accomplishment, which might be mine also, for, though natural, it comes by Art. And if his ear can hear sounds in the trees, on the shore, in the grass, or on the edge of the far-distant horizon that make no impression upon my dulled and careless tympanum, I feel that I have done injustice to the savageness that is latent within me; and when I think of it, I long to start off into the wilderness, and to "rough it." We all of us like "rough it" now and then. What made the great Haroun Al Raschid leave his palace at night in search of adventure, and consort with his people as man to man, but the oppressive weight of ceremonial and civilization which was too much for him to bear? What makes the rich man travel to Norway, or to the Western Prairies, or go yachting to Nova Zembla or Spitzbergen, if it be not the necessity, that he feels for being a savage, and of shaking off the iron chains and suit of armour of modern fashionable life. It is pleasant to see that there is a greater love of "roughing it" among Englishmen (and in the term are to be included Scotchmen and Irishmen) than among any other civilized people.

It is a good sign. The spirit of the savage—the true, the noble, the independent, adventurous—permeates in Anglo-Saxon veins. It is this which sends them to explore Central Africa, and discover the North-West passage. It is this which makes them hunt the lion and the buffalo, which makes them take an animal delight in prize-fighting and cock-fighting; it is this which makes Robinson Crusoe such delightful reading, and which sends so many hundreds and thousands of adventurous spirits to sea. It is this which makes young men scale Mont Blanc and Monte Rosa, and emperil their necks and their lives on treacherous slopes, where the rotten snow conceals the fatal crevasse. And coming from the ruler to the gentler sex, it is this which makes the ladies find so much pleasure in pic-nics. They, too, though not tired of their clothes, are weary of stiff observances and ceremonials. They like, bless them, to dine on the grass, and light their own fires as the gipsies do. They are glad when the corkerew has been forgotten, and the neck of the champagne bottle has to be broken; more than glad when they have to hunt for water at the nearest spring, and to use their own dainty little taper fingers instead of forks, as their great foremother and progenitrix Eve was obliged to do ere the serpent tempted her with his specious tongue, and brought sorrow, civilization, and clothes into the world, at one and the same time.

And the same enjoyment that is derivable from the pic-nic is derivable from any dinner where Nature, by necessity, is allowed to be paramount over Art. I have given dinners in my day, and good ones, and have been a guest at grander and more pretentious repasts than my own. I have dined with an Emperor, though the imperial bird was a callow President, and not a fully-developed Imperial Eagle at the time; I have dined with the Lord Mayor, and with a far more magnificent personage, the Prefect of the Seine; I have dined also with a king, and had a very good dinner, though, as a mere display, the Prefect's dinner was much more gorgeous; I have also dined—more than once, or a dozen times—with a private English gentleman (not Mr. G. W. M.), and had a more elegant and more satisfactory repast than Emperor or King, Duke or Earl, Lord Mayor or Prefect, ever provided. But of all my dinners, my savage dinner was the best, and dwells most freshly upon my memory. It happened thus—Twenty of us, young and old, lovely ladies and reverend seignors, nisses and usatrons, resolved, once upon a time, to set out from the "capital of the Highlands," on a visit to a lake, upwards of fifty miles distant, celebrated for its grandeur, but very little known. I dare say that few of the readers of these pages ever heard of it, though it is worth going a thousand miles to see;—Loch Maree, or the Lake of Mary, away in the far west of Ross-shire, larger than Loch Lomond, wilder and grander than Glenoe, and bordered with bare perpendicular hills, two thousand feet high. It was within a week after Midsummer that we came to this determination. At that season there is but little night in these high latitudes, and we travelled in open carriages, encouraged by the unclouded brilliancy of the blue sky, upon which there was not a speck of cloud as large as a mushroom, and which had been equally spotless for several days previously. Away we went, the ladies in all their finery, looking as fresh and as radiant, every one of them, as that bright morning light. For twenty miles we travelled, rejoicing, over a bare wild country, the contemplation of which made every man among us long to develop the savage, and to get rid of the citizen, by taking to his legs and climbing to the mountain-top, agile as the goats that peeped down upon us as we passed. But a change was at hand. The day, with all its beauty, was deceitful as a flirt. The wind suddenly veered round, and in a quarter of an hour there came upon us from

the far north-western seas, an array of dark rain-laden clouds, that covered the whole face of Heaven.

"Why didst thou promise such a beautiful day,
And let us travel forth without our shaks,
And let base clouds o'ertake us in our way?"

Why, indeed? Why—but that we might enjoy ourselves more in the storm than we ever could have done in the sunshine. Down came the rain in torrents; there were but a few parasols and a scanty party or two among the company, and what were parasols, and all the umbrellas in the world, in such a drenching deluge as that? There was no shelter within five miles, and that was at Achmannault—marked as a town upon the map, though consisting of one solitary house—but this was a hostelry of good repute, and as our carriages were not made to shut, our best plan was to drive on as fast as our steeds could run. In two minutes we were up to the skin, and could scarcely have written had we been folkling in the snow, though doubtless we should have been much more comfortable. And, alas! for the ladies! Never were seen more wo-begone creatures in the world of sorrow. All their ribandry and gauzery—their silken and velvety—were dragged, and limp, and shapeless—as lost to ornament as the gibes, the gambols, and the quips of dead Yorick to the friends who loved him. Like balloons that had collapsed, they had shrunk into less than half their former size, and were as little like their former selves as the leafless hawthorn in December is like the hawthorn in the full bloom and luxuriance of May. In half an hour we arrived at Achmannault, and found that there was abundance of oat-cake, abundance of salmon, abundance of grouse, abundance of bottled stout and ale, and superabundance of whisky—enough for a hundred people to eat and for a thousand to drink; and so we ordered dinner. The ladies retired into one bedroom, and the gentlemen into another; and in a few minutes they severally re-appeared in the dining-room, without their wet clothes, and in garments that would have delighted the Red Indians of North America to look at—and to steal. Sheets, blankets, counterpanes, and hearth-rugs, twisted around them in every variety of shape and fashion, formed the costume of the ladies, while the gentlemen only wanted the feathers, the wax-pipe, and the tongs, to realize one's idea of the brave Chingachgook and Uncas of Cooper's Indian stories. I, John Wagstaffe, then M.P. for Wigglesbury, had a coarse red-and-brown hearth-rug girdled around my loins instead of a kilt; my legs and feet were each ensheathed in a short, tied round with a string; and over my brawny shoulders I wore a piece of bedroom carpet, of as many colours as the coat of Joseph. Not one garment, mentionable or unmentionable, worn by either sex, was to be found at that dinner party. They hung at the kitchen fire to dry; while in such savage costume as was pleasant to the savage nature—thus suddenly developed—we placed ourselves at table. Excellent was the salmon, excellent the grouse, excellent the stout, and excellent the whisky; while the laughter that, not metaphorically, but actually made us cry with its own excess, was of a heartiness that few men or women experience more than once in their lives.

Never, at home, in any civilized and full-dressed festival—never at the board of king or emperor, lord mayor or prefect—did I, John Wagstaffe, laugh as I laughed, eat as I ate, drink as I drank, enjoy as I enjoyed, sport as I sported, on that occasion. A whole year of fine days and civilized observances would not yield one tithe of the physical and mental joy yielded to all of us by that one day of storm and rain, and defiance of etiquette and clothes. Let Pomp think of it, and learn wisdom. Let Ceremony reflect, and reform itself into simplicity. And O! great king or emperor, lord (in your own opinion) of the destinies of millions of men, just think of our freedom, and ask yourself whether you could endure the weight of your royalty, or imperialism, if it were an essential condition of its tenure that you should never put off your clothes—that you should wear your heavy golden crown sleeping and waking, both by day and by night; never be kissed by the lips you loved, were they lips of woman or of blessed little children; and that you should never be addressed except by your full titles, and be be-majestied and be-gnored, and be-lorded, every hour of the day? For would not any man—wretchedly to be deemed a man—rush out of such slavery to escape madness,—would he not go and cut down trees in the forest, dig in a garden, shoot the grizzly bear, or consort with Panwnee and Potawatamies in the wilderness?

In fact, even the gentlest and humanest of men require to go back into savage life now and then. Why, for instance, does the angler hook the unsuspecting trout, and insinuate his cruel contrivances through his harmless gills, unless it be that the savage is in him? This savage love of killing exists, more or less, in all true Britons. I do not speak of the butcher, who kills sheep and oxen because it is his business to do so,—for he is the civilized man, and only conforms to his vocation; but of the sportsman,—the grouse-shooter,—the lord of the stubble-fields when partridges are plentiful,—the Nimrod of the mountains, who stalks the deer, and kills, neither to eat, nor to sell, nor for convenience, nor for necessity, but because he feels the Savage in his blood, and thoroughly enjoys the roughness and the warfare of the wilderness.

Homer sometimes nod. The bow cannot always be bent (I shall not quote the Latin). The civilized man must sometimes allow the innate Savage to have a turn—either at work or at play; and it is well. Were it not so, we should degenerate into a nation of pigs and milkpicks; and Napoleon III. or Brother Jonathan might "annex" us at his leisure.

CRYSTAL PALACE.—ARRANGEMENTS FOR WEEK ENDING SATURDAY, NOVEMBER 17th.

MONDAY, Open at Nine. TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, Open at Ten. Admission, One Shilling; Children under twelve, Sixpence.
The **CHRISTANTHEMUM SHOW** will be held on THURSDAY, FRIDAY, and SATURDAY.
SATURDAY. VOCAL and INSTRUMENTAL CONCERT, and **CHRISTANTHEMUM SHOW.** Admission, Half a Crown; Children, One Shilling; Reserved Seats, Half a Crown extra.

Orchestral Band and Grand Organ Performances daily.
Season Tickets, Admitting until 30th April, 1861, are now on sale at 10s. 6d. each.
SUNDAY. Open, at 12½, to Shareholders gratuitously, by tickets.

CRYSTAL PALACE.—CHRISTANTHEMUM SHOW.—THE GRAND ANNUAL SHOW OF CHRISTANTHEMUMS will be held at the Crystal Palace, on THURSDAY, FRIDAY, and SATURDAY, NOVEMBER 16th, 17th, and 18th, 1860. Doors open at Ten. Admission, Thursday and Friday, One Shilling; Saturday, Half a Crown. On Saturday, there will also be a Vocal and Instrumental Concert.
Season Tickets free may be had at Half a Guinea each, available till 5th April, 1861.

PAPER AND ENVELOPES.

PARRIDGE AND COZENS, Paper and Envelope Makers. The Largest and Cheapest Stock in the Kingdom. Carriage paid to the Country on Orders over Twenty Shillings. Illustrated Price Lists post-free.

For Reams. Per Thousand.
Twenty Cream-bleed Note. 2s. 6d. Super Thick Cream-bleed Envelope. 4s. 6d.
Superfine blank ditto. 3s. 6d. Large Blue Office ditto. 4s. 6d.
Superior Blue Envelope. 3s. 6d. Best Black-bordered ditto, per Hundred, 1s.
German Paper, plain, 4s. 6d. ditto, ruled, 5s. per man. Good Copy Books, 6s. per gross.
F. & Co.'s celebrated "Golden Pen," only 1s. per gross. Pen-holders, 2s. per gross.
No Charge for stamping. Crest Dies, from 5s. Business Dies, from 2s. 6d.

PARRIDGE & COZENS, 192, FLEET-STREET.

PIESSE & LUBIN'S SWEET SCENTS.—Fragranci, Kiss-me-quick, White Rose, and others from every flower that breathes a fragrance, in bottles, 2s. 6d. each, or there is a case, 7s. Sold by fashionable druggists and perfumers in all parts of the world.—Laboratory of Flowers, 2, NEW BOND-STREET, LONDON.

SCALE OF CHARGES FOR ADVERTISEMENTS.

Per Line. 3s. 6d.

Every additional Line, after Four Lines, Sixpence.

Advertisements exceeding One Column in Length are charged at a proportion.

ADVERTISEMENTS ARE RECEIVED UP TO EIGHT P.M. ON THURSDAYS.

TERMS OF SUBSCRIPTION.

Quarterly. Half-Yearly. Yearly.

Stamped. 4s. 4s. 8s.
Unstamped. 3s. 2s. 6s.

Or, Threepence per Copy for any period, with One Penny additional if sent by Post.

Orders for "THE LONDON REVIEW" are WELLED FORWARDED received by all Booksellers and News-vendors; or, at the Office, 11, Abchurch Lane, London. Single Copies may be had of the Editor, Mr. W. LITTLE, Manager. A Single Copy sent free by Post on receipt of Four Postage Stamps.

THE LONDON REVIEW

AND
WEEKLY JOURNAL.

SATURDAY, NOVEMBER 10, 1860.

THE *Gazette* of Saturday last contains Lord Elgin's despatch from the seat of war in China, with the official account of the recent capture of the Taku forts. So early as the 14th, 15th, and 16th of August, it appears that the British plenipotentiary received communications from the court of Peking, offering to open conferences with him in the capital. As, however, no sufficient assurances were given of the resolution of the Government to concede the points demanded in the letter sent to the great council in March last, Lord Elgin intimated that he could not put an end to hostilities. Meanwhile, the preparations for the attack on the forts were rapidly proceeded with.

It was necessary for the allied army to cross a marshy tract, ten miles in width, which, contrary to Chinese precedent, had been everywhere put in a state of defence. The troops left Peking on the 12th, but it was not till the 21st that they were fully prepared to commence operations. At five o'clock on the morning of that day an English column, 2,800 strong, and a French force, 1,000 strong, proceeded towards the southern upper and lower forts, and fire was immediately opened on both sides. The Armstrong guns were worked with terrible effect. At halfpast six, a fearful explosion took place in one fort; and about ten minutes later, another, more terrific still, burst forth in the other. Burns of wood, earth, and bodies, were hurled into the air; while the concussion shook the ground for miles around. At eight o'clock the ladder-party was ordered to advance, and an assault followed, in which Lieutenant Rogers and Ensign Chaplin conducted themselves with a gallantry which cannot be too highly praised. In the course of the forenoon the fort was taken, the Tartar garrison fighting to the last with great desperation. In the evening of the same day, all the other forts capitulated.

In this short campaign of ten days we have met with a more formidable resistance than we ever did previously in any Chinese war. Of our officers, 2 were wounded dangerously, 13 severely, and 7 slightly; of the private, 17 were killed, 4 were wounded mortally, 107 seriously, and 40 slightly. The number of the French killed *hors de combat* was estimated at 130.

In his last despatch, dated the 26th August, Lord Elgin states that he had arrived at Tien-tsin, and that suitable arrangements for the troops had been found in the neighbourhood. Kwei-Leng and Hang-Fuh have been appointed to conduct negotiations on the part of the Chinese Government.

That Lord Elgin acted judiciously in refusing to enter into any negotiation

with the Chinese Government previously to the capture of the Taku forts is proved by the arguments since made to dissuade him from ascending the Peiho with a large armament. Now that we have struck a vigorous blow at such cost in men and money, it is to be hoped that the plenipotentiaries will lose no time in bringing the war to a satisfactory conclusion, enforcing a large indemnity, and by a display of military force convincing the populace and the court of Peking that the European powers are able to chastise the folly and insolence of the Manchou Government.

Among the most important events of the week is the publication of a despatch, dated the 27th ultimo, from Lord John Russell to Sir James Hudson, the Sardinian ambassador, more in consonance with public opinion in this country, than the memorandum previously sent to the court of Turin. This document, called for by the position of the continental Powers towards Victor Emmanuel, expresses the opinion of the English Government on the questions: Were the people of Italy justified in asking the assistance of the King of Sardinia to relieve them from governments with which they were discontented? And was the King of Sardinia justified in furnishing the assistance of his arms to the people of the Roman and Neapolitan states? According to Lord John Russell, arguing on the principles laid down by Vattel, these questions resolve themselves into this: Did the people of Naples and the Roman States take up arms against their governments for good reason? The English Government cannot say that they did not, and therefore cannot pretend to blame the King of Sardinia for assisting them, or see any sufficient ground for the severe censure with which Austria, France, Prussia, and Russia have visited the acts of the King of Sardinia. It is easy to foresee that this despatch will produce a powerful influence on continental diplomacy, when taken in connection with the recent success of Garibaldi and the triumphal entry of Victor Emmanuel into Naples.

On the 2nd current, the garrison at Capua capitulated, and to the number of 8,000, where marched to Naples, whence they were to embark to Gaeta. On the following day, the Piedmontese army, under the command of King Victor Emmanuel, gained a brilliant victory, routing and dispersing the Bourbon army. Attacked in front with great spirit by the Piedmontese troops, and in flank by the fleet, under Admiral Persano, the troops of the ex-King retreated in confusion, leaving in the hands of the Sardinians their tents, wagons, and *artillerie*, with a large number of prisoners. General Soma pursued the enemy along the coast to Gaeta. He now occupies Mola di Gaeta, and other positions near the last stronghold of King Francis II.

From a telegram received on Thursday evening, we learn that a body of 15,000 Neapolitan troops, with 4,000 horses and 32 guns, being pursued by the Sardinians, took refuge in the Papal States at Teano. They advanced to Civitella, where their progress was arrested by the Papal and French authorities. They were to be at once disarmed. The Bourbonist forces now cannot number more than 20,000 at the highest estimate, and we may therefore conclude that Gaeta will, after a brief siege, fall into the hands of the Sardinians.

The Neapolitan Supreme Court of Justice has proclaimed the result of the plebiscite in the Kingdom of Naples. It gives 1,310,266 votes in favour of, and 16,012 votes against annexation. In the Papal States the voting is going on; and even in those districts still occupied by the French troops the results are entirely favourable to United Italy. In Umbria and the Marches the greatest enthusiasm prevails.

On Thursday morning, at half past nine o'clock, King Victor Emmanuel entered Naples, where an immense crowd had assembled to welcome him, notwithstanding the torrents of rain which were falling. Universal joy was manifested on the city.

The French Government have found it no easy task to explain away some recent despatches to Italy. The official papers of Paris deny that the French Admiral interfered with the proceedings of the Sardinian fleet at Gaeta; but they admit, at the same time, that instructions were transmitted to him which might have led to such interference. These they defend on the ground that the blockade of Gaeta had not been recognized by any of the Powers, and that a double attack by sea and land would have exposed the ex-Queen of Naples, the youthful members of the royal family, and the ladies of the Neapolitan court to the greatest danger. We have as yet no very satisfactory account of what has really taken place between the French and Sardinian naval commanders. It is said, that on the 30th Admiral Persano attempted to disembark at the mouth of the Garigliano, and in presence of the French squadron, which had got under way to constrain him to withdraw, refused to do so, on the ground that he was beyond the waters of Gaeta and the line of the blockade of that port. In presence of the protest of Admiral Persano, the French Admiral, fearing that he might have exceeded his instructions, withdrew, sending off the *Despatch* to obtain fresh orders. In the mean time the Sardinian fleet rendered efficient assistance to the land forces, pursuing the scattered troops of the Bourbons from the mouth of the Garigliano towards Gaeta.

The statement recently made by General Lamoricière, in a letter addressed to the official paper at Rome, that the French Government had given a promise to prevent, by force, the Sardinian occupation of the Papal states, has been replied to by the Duc de Grammont, the French Ambassador at Rome. The despatch was, it appears, tampered with by the Roman War Office, the words "by force" having been added to it. Accordingly a new version of the document has appeared in the *Gazzetta di Roma*, in which these words are left out.

The *Armonia* of Turin, an organ of the clerical party, contains the startling announcement that the Emperor Napoleon has offered the Pope a refuge in Avignon. This assertion seems to have created some alarm in Italy, it being believed that it will be an advantage to France to have the centre of the Catholic world brought within her own frontiers.

Whatever be the ultimate intention of the Emperor, the French garrison at Rome has been supplied from Marseilles with large stores of warlike provisions.

Count Rechberg has addressed a circular note on the Warsaw interview to the representatives of Austria abroad. It states that a perfect understanding was established between the three Princes present as to their conduct in view of certain eventualities understood to be disturbances in Poland and elsewhere; but that at the same time non-intervention in the affairs of Italy was agreed upon.

The alleged enthusiasm of the Austrian provinces on the promulgation of the decree of the 26th ult. was very much exaggerated by the official telegrams. At Trippan, the capital of Sicily, the citizens were perfectly indifferent to it. In Prague things were no better. At Zantz there was no demonstration. Innsbruck was illuminated in compliance with orders from the Burgomaster, who holds an office under government.

At Woodstock, on Wednesday last, the Bishop of Oxford delivered his triennial charge to the clergy of his diocese. He specially adverted to Church Rates and Liturgical Revision. With regard to the former, he advised his hearers to wait patiently, without themselves proposing any scheme for alteration, lest they should precipitate, by a doubtful solution, the settlement of so great a question. He protested most emphatically against any attempt being made to effect a revision of the Liturgy, as he held that behind those who desired to provide briefer and simpler forms of public worship, there were men who had other objects in view, and who would effect such a cleansing of the Book of Common Prayer as would lead to a disruption of the Church. Any innovation on the existing formularies, indeed, he considered to be dangerous at a time when persons are heard to declare that the miracles narrated in Scripture are parts of a system of naturalism which it is the duty of reasonless criticism to unravel and discover.

In all parts of the country the rifle matches are still proceeding. At the dinner which followed the distribution of prizes on Monday to the successful competitors at the first annual contest of the Cheshire artillery and rifle volunteers, Mr. Gladstone made a long speech. He remarked that the volunteer movement had supplied a contradiction to the saying of the first Napoleon, that the English are a nation of shopkeepers, who have lost the energies and warlike tastes of their forefathers. At a time when the elements of danger are rife in Europe,—when a war is going on in Italy which deserves the sympathies of Englishmen, and when great questions are about to arise respecting the regeneration of Turkey, he rejoiced that England should look morally and physically strong. He held it to be most true, that he who reckoned the volunteers as merely adding a force of 130,000 or 170,000 to the military strength of the country, took a view of what they will do, which is totally inadequate to the truth of the case.

A great Volunteer excursion party to Paris has been proposed by a very obscure person, whose name we prefer to leave in its obscurity. This person has even written to the Emperor Napoleon on the subject, and received an answer from his secretary, in which the promise is made of a warm reception from the French authorities. He has since communicated with the Commander-in-Chief of the British Army, the Secretary for War, and the French and English railway companies, and from all quarters he has received assurances of favour and approval. Lord Derby, in a letter to the *Times* of Wednesday last, states many obvious objections to the scheme.

Free trade is now gradually beginning to find favour with those classes and interests which have clung most strenuously to the doctrines of Protection. At the annual meeting of the Sunderland Shipowners' Society, which took place on Tuesday last, a report by the committee, was read in which regret was expressed that so much strength had been wasted in the useless effort to prove that the repeal of the Navigation Laws was a great political and commercial blunder. The society have now resolved to uphold the policy of free trade in maritime intercourse.

The steamer *Des*, from Havre, with the Irish Brigade on board arrived at Queenstown on Saturday morning. Their reception was most enthusiastic. The streets of Cork, according to the Irish papers, have not since the days of O'Connell known so many *riots*. At Dublin, so enthusiastic was their welcome, that a veteran soldier, who happened to be present, declared it to be only paralleled by the reception of the Highland regiments in Edinburgh at the close of the war in 1815.

The announcement made in various English and continental journals, that an engagement has been contracted between her Royal Highness the Princess Alice and Prince Louis of Hesse Darmstadt, is stated to be premature. The Prince, however, has been a guest at the court of the Queen during the past season, and is expected shortly to return to this country on a visit of longer duration. He is the eldest son of Prince Charles, brother and heir presumptive to the Grand-Duke of Hesse Darmstadt, who has no children, so that it is by no means improbable that the alliance may ultimately be contracted.

MONEY AND COMMERCE.

On Thursday, in accordance with the general anticipation—strengthened by the knowledge that the Bank had raised the rate at which it discounted long-dated bills—the minimum rate of discount was raised by the Bank from 4 to 4½ per cent. This, though in the language of commerce it has long been discounted, is the great moneyed event of the week. It has had no immediate effect either on the money or stock market. Money, for the purposes of commerce, continues to be about as amply supplied as before, and the funds generally in the week, and also on Thursday, showed a tendency upwards. Within the last few days political events have been averted, and they have had more influence over the funds than the condition of the money market. The consequence is that the funds have generally tended upwards in the week, instead of downward as they should from money being dearer, and Canada have ranged somewhat above 89½. Now that the rise in the rate of discount has taken place, we may briefly refer to the causes which led to it.

For some weeks, as the columns of almost every journal have testified, there have been great fluctuations in opinion as to the Bank raising the rate, though the anticipations have generally been that the rate would be raised. These were founded on the well-known fact that gold was continually going out of the country more than was coming in, and on the equally apparent fact that the reserve of the Bank of England was rapidly decreasing. The latter is the practical guide to the conduct of the Bank, and the weekly returns show that the reserve has declined, speaking in millions, and not encumbering our space with many figures, from 99 on September 19th to 79 on October 31st. Or, in six weeks, the reserve has declined nearly £2,000,000. In the week ending October 17th it decreased £1,300,000, and then the rise was immediately expected, but it did not take place. The demands of commerce have been steady, but the reserve of the Bank has fluctuated.

The uninitiated will scarcely believe us, we are afraid, when we state that this reserve, which possesses such vast influence, and occasions such unpleasant anticipations, consists in the proportion of six out of seven of the Bank of England's own promises to pay on demand. There is less than £1,000,000 of precious metals in the bank department, in which the whole reserve is placed. The proportion of gold and coins does not vary much, and the bulk of the reserve consists entirely of the Bank's own notes. It will seem strange, therefore, to the reader that any deficiency of those notes, which could be created at will, should be suffered to operate against the commerce of the country, and that the rate of discount should be raised because the amount of them in the hands of the Bank declined. The explanation is this. The Legislature forbids the Bank from issuing more than a certain amount of its promises to pay, and so the growing and fluctuating wants of commerce are confined for money to this Prætorian bol of legislation.

The same Bank returns which inform us of the decline in the reserve of the Bank, also inform us that the wants of the public for bank-notes have increased. In the week ended September 19 the circulation was 21½; in the last week it was 22½. The wants, then, of the community for legal tender money, and the inability of the Bank to supply it, are the immediate and real causes of the rise in the rate of discount. If it be said that the total amount of bank-notes issued is determined, and by the Legislature, but by the effect of gold, the restriction on the community and the difficulties of commerce, equally certain, will be caused by the demand of a new French Bank for gold. The outgoing of the precious metal is less occasioned by the ordinary requirements of commerce than by the operation of this new Bank; and in the end the lamentable conclusion is, that our own law regulating currency places it in the power of a foreign speculative body, by taking away our gold, to hamper all the commerce of England.

We know, and every man who reflects on this subject knows, that the demand for capital ultimately determines the rate of discount; and that lately there has been a considerable demand for capital to send abroad in order to buy corn, and that every one has in consequence, for some time, expected a rise in the rate of discount. But this is a steady though increasing cause, while the amount of the reserve of the Bank has been so varying from week to week, that the hopes and fears of men have continually vacillated. The side end of all currency regulations is to promote the convenience of the people, the advantages of trade and of merchants; and when they are inconvenient, as they are greatly, by regulations which make the rate of discount depend on the reserve in the Bank of England, while that again depends on a demand for gold to establish a French bank, it is high time those regulations were taken into consideration and amended.

The corn-trade has been comparatively steady and dull; supplies have not been large, particularly of home-grown produce, but prices are unaltered.

Some of those reports which arise every year of frosts affecting the cotton crop in the United States have been put into circulation this week. They have had the effect of exciting great activity in the cotton-market, and effecting a slight advance in the price. The fact shows the necessity of extending the cultivation of cotton into regions beyond the reach of frost.

The war in China has had no further effect on the tea-market, which has remained steady and rather dull than otherwise, compared with last week.

Generally, however, colonial produce has ruled high, an unusual price of the funds of commerce having been derived from the colonial trade to procuring the more necessary supplies of wheat. The supplies of colonial produce are, in truth, short; and we must now have increased production, or there will be a further rise of price.

From New York in the week we have heard that a very considerable fall has taken place there—from 4 to 5 per cent.—in almost all stocks and shares. The principal reason for this we believe to be the great previous advance, of which the fall was only the speculative reaction. Such property is too well secured by its utility to be subject to permanent depreciation.

MEN OF MARK.—No. IX.

WILLIAM CUBITT.

THE Lord Mayor Elect of London! A fitter subject for one of these sketches, with the object they have in view to outline eminent men who have risen by their own estimable qualities and energy to eminence, could not have been suggested by any public event, even if his elevation to the seat of the chief magistrate of the greatest city on the face of the globe had not, as it were, forced upon us the undeniable claim of William Cubitt to stand forward among the number. The manner of his election, and the unanimity of opinion that prevails throughout every rank of the community respecting the deserts of this gentleman, demonstrate the fact of his worthiness to be considered as no common occupant of the high station he is called upon to fill. It is pleasant to contemplate such a character, and a privilege to be able to describe it from long and near observation; though, we assure the reader, utterly independent of circumstances, and, we prospectively believe, somewhat repugnant to the modesty of the party portrayed, and who can know nothing of the pencil employed in this off-hand draft.

The family of William Cubitt are men of the present age—men of progress; not men who, as Shakespeare says, "to beguile the time, look like the time," but men whom the tendencies and appearances of the time have shaped to utilize and adorn it. His elder brother (by a good many years), Thomas, led the way to the elevation of the family in wealth and consequence. He also was a man of no small mark, though he never mixed in public affairs; but, dying, left his son in a position to become the invited and honoured representative in Parliament of a populous English county. The world is, after all that can be said, a tolerably discriminating world. It may allow mediocrities and commonplace people, and even some who are little fitted, to pass along the beaten path, taking their share of routine advantages, without comment or censure; but when we observe the same triumphs achieved by persons of their mind, every way eligible, and prius by them as likely to reflect much laurel as they receive, and hereby benefit their fellow-creatures by the faithful discharge of the imposed duties, it is a cheering thing to witness the honest oblivion of general feeling, so unequivocally manifested whenever occasion offers.

William Cubitt, Alderman and M.P., began life with a humble start. He adventured on the sea, and was, like our greatest living landscape-painter, a "ship-boy on the high and giddy main." Relieved from this uncongenial pursuit, he began his land life (not as the gentleman, but at sit home at ease, but with toil before him) on one of the lower steps of that ladder the top of which he has now nearly reached. His course has been a true type of the Builder's ascent, step after step. Gradually, securely, with a firm footing, elevating story after story of the edifice meant for future comfort and the enjoyment of the latter years in respected tranquillity—ever looking upwards, single is aim, constant of purpose, liberal of means, and immovable in integrity. From the foot where he began to climb, let us follow him to the midway station we may here suppose him to have attained. What sort of a man is he? In the midst of the bustle of scenes one of the quietest we ever saw; in the tumultuous distraction of the most intricate crises one of the calmest. He seems one of Nature's philosophers—cool, not frigid, serene yet vigorous. Remarkably deliberate, as the reverse of demonstrative; whatever question demands his attention, he is a private affair, magnificent, or legislative, it may be assured of his utmost or highest consideration (quite different from the meaning in a diplomatic letter), and the result a judgment equal to his capacity, uninflected by the slightest tinge of biased or sinister motive. In a word, viewing a long course of mercantile and pecuniary concerns, we have seen that Mr. Cubitt is wonderfully pure in mind, and has neither suffered aversion to contaminate his trade-dealings with unskilful, nor ambition to warp him from the straightforward line of justice and humanity in his official ministrations.

The late Mr. Thomas Cubitt opened the path for his brother to a less trying ordeal from a limited beginning than he had undergone himself, but still the pursuit required adequate talent and steady perseverance. Men of business in London do not leap into the foremost rank *per saltum*. A number of efficient qualities are requisite to effect that standard reputation and durability; and chance has seldom much to do in the matter. Apparent success, owing to shrewd, cunning, effrontery, or wrong, are only rare exceptions to the good old golden rule. That rule was the guidance of our subject, and hence he rose from the middle places, where we have just been contemplating him, to higher station, where he now is, with accumulating approbation and increased numbers of admirers. He did his work well. He undertook nothing he could not do. It is a plain, unostentatious boast, but it was the greatest we ever heard from his brother's lips.—"Well, I believe I never built a house that did not give satisfaction; and there was anything found wanting, I was always ready to amend it!" Can we wonder that, with such a creed, and such a practical exemplification of it everywhere acknowledged, acres after acres, my miles of ground, new suburbs, new cities in extent, streets, crescents, and squares (innumerable, villas, palaces, and we know not what all, in every suitable style of architecture, in every class of building, and, what is better and, with accumulating approbation, in every class of honest from the foundation to the roof-top—meeting our eye in every quarter, in witness of Cubitt skill and Cubitt good faith. Let common house-lapping men take all its conveniences, and let luxury demand its facilities for display; it is a grateful task to earn the thanks of competency for congenial comforts, and even of ostentation for its much-prized poem.

So pleasantly situated with relation to his employers, it is still more agreeable to turn our glance to Mr. Cubitt as himself the employer of many hundred men; the head of a large establishment of educated accountants, clerks, and overseers, and of skilled artisans and hardworking labourers. Under existing circumstances there are few positions more useful and onerous; and in this point of view none stand higher than William Cubitt. Here are the valuable qualities we have ascribed to him come into full play, and their operation is most salutary. His men are

independent in themselves, neither spoil *tyrannants* nor oppressed slaves. His government has ever partaken, as we may say, of the genial or patriarchal. His watchfulness has extended over their sicknesses and troubles; and even when misunderstandings have arisen, his course has been conciliatory and moderate whilst just and firm. The workmen combinations in his particular case, therefore, have not partaken of the angry and evil passions. *Strike*, but *Heal*, has been his motto; and if reason failed, acrimony or resentment were not evoked to maintain a worse and more dangerous argument. The humane master had given due consideration to every eye in his service. Every one confessed his thoughtfulness, his kindness, and his benevolence. They could have no complaint, except such as was raised upon an abstract principle; and accordingly they averred with reluctance, and returned with good will to their occupations and a fair day's wages for a fair day's work, when the storm had blown over. His spirit pervaded the business, from which he had retired several years ago in favour of a younger brother, whose very brightly during the late unadvised strike.

But there are various other phases, and circles within circles, spread throughout our civilized community, in which the spectator likes to catch a glimpse of those who have specially attracted his notice on the more public theatre. Is the author a bookworm—is the merchant quite absorbed in exports and imports—is the architect and builder altogether wrapt up in plans and estimates? Not Mr. Cubitt. Long before he mounted to the midway of our sketch, and ever since as he has been rising to the top round where he is now as conspicuous—the observer of all classes—he has been distinguished by his social habits. He is some, the wish to please, and willingness to be pleased, are sterling recommendations to the dinner-table, and these he always brought with him. Conversant with what the world was doing, and next in remark, without aspiring to overcondescend to others, his share in the conversation failed not to interest and amuse. A peculiar civility of demeanour and simplicity of diction have ever made him a welcome companion. On such occasions, and in his domestic hospitalities he has courted the intimacy of men of literature to their mutual gratification; and it will add to his credit in many a charitable breast to learn that in the mystic bond of Freemasonry he occupies a prominent rank.

Some, it is said, have murmured that upon them; but his advent to civic aid and service will surely state our belief that he was the sought rather than the seeking. His station, and character, and wealth, combined to point him out as a deserving recipient of City honours. He consequently served the office of sheriff (1847-8) with Mr. Charles Hill—a colleague every way worthy of the association; and the labours of their year were performed with friendly harmony and liberal public spirit. About this period he was elected for Andover; and, probably to fill up the vacant time usefully between the sittings of Parliament, entered warmly into the management of City concerns. In a short time elected an alderman, and signifying himself by the ability with which he has taken a leading part in the responsible affairs which have been and are pressing upon the condition of the City of London, and the corporate body that has ruled it for many centuries, he is now the First Magistrate of the greatest capital in the world.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

THOSE who were most impatient for the entry of Victor Emmanuel into Naples must now cease their complaints, for the King of Italy entered the Capital of the South yesterday morning, amongst the enthusiasm of the entire population. I am informed that the latest reliable advice from Genoa asserts that it will be quite impossible for the ex-King to remain much longer on shore. His departure in a French or English ship is looked in from hour to hour. The flight of 15,000 of his troops into the Papal territory, and their disarmament by the Roman authorities, aided by the French soldiers, is the *coup de grâce*. It is gratifying to find that in the last decisive battle, the fleet, under Admiral Persano, co-operated with the land forces, without any interference on the part of the French naval commander.

The despatch of Lord John Russell to the British Minister at Turin, has been received, as is deserved, with universal approbation. It is a just echo of the public sentiment, and fully redeems the former despatch of the 31st of August, which, although containing some advice useful at the time, was couched in ungracious language, and grated harshly on the public ear. The only mistake about the despatch of the 27th of October was its partial publication in the columns of a single morning paper on Saturday last. If it was right to give it publicity, it ought not to have been kept out of all the other morning papers till Monday morning. The course so properly observed by the Government of late, in sending all public documents to every paper at the same time ought not to have been departed from in the case of so valuable a document as this, which was no longer the property of the writer, but of the public. Still, this does not justify attacks upon a State paper which has instinctively received the fullest approbation from all classes of Englishmen.

Another of our eminent public men, Mr. d'Israeli, has been on his trial, and has thoroughly vindicated himself from the absurd charges of a crony and meddlesome person, who has fastened himself upon him, and got an over-credulous M.P., Mr. Donald Nicol, to proscribe the foolish gossip about the Berwick election, which Mr. d'Israeli has now dispensed into "thin air." Mr. d'Israeli will, no doubt, in future avoid the allusions of such folks as Sergeant Doxie, whose antecedents in the Canterbury duel, and the alleged revelations at Weymouth, ought to have been sufficient warnings to the gifted author of "Vivian Grey." *Alisandrow Dorwell*, &c.

Mr. Klotz Rowlett, whoever he may be, has put forward a ridiculous scheme for a visit of Volunteers to Paris, which, we hope, has received its *quies* from the press.

The Conservative organs make a great noise over the recovery of a single seat at Beeton. The truth is, that Mr. Taylor was not the best candidate on the Liberal side, and more than 200 of the Whig electors refrained from voting, whilst Mr. Malcolm, the successful candidate, is a moderate and respectable gentleman, of education and large fortune.

In the case of Dartmouth, the late member, Mr. Dunn, was elected without opposition. His successor, Mr. Hardy, the wealthy proprietor of the Low Moor Iron Mines, was run very close by Mr. Ilayne, and a petition will leave the decision to a committee of the House.

There are two of the largest constituencies now vacant, Newcastle and South-wark, where the reaction (if any) can be fully tested. There is a host of "local" men feeling their way in Southwark, but the old public reputation of Mr. Wakley will probably scatter them all, if he determine to stand, which is doubtful.

Morocchetti's statue of Cesar de Lion is certainly the boldest and most successful of our artistic monuments. It has a rough, defiant air, worthy of the lion-hearted king. The position chosen for its resting-place is well selected, but not without some essential drawbacks. It is rather too near the wall of the Parliament-house, scarcely allowing sufficient space for full relief of so noble an object as this "horse and its rider." The pedestal has not the faint of most of our monuments, which are generally placed too high from the ground—but, on the other hand, it is scarcely broad or long enough for the figure it has to support.

The Guards' Memorial at the foot of Waterloo-place, which has been so severely criticised, is not yet complete. But the statue of Glory has been placed on the top, and the whole affair has a very obnoxious and provoking air of remaining where it is, spilling one of our best sites, and impeding one of our leading thoroughfares.

It is curious to see how many of our modern monuments are thoroughly out of place. It is contemplated to remove the statue of Jenner from Trafalgar-square to a more suitable locality; but there are other monuments preparing for that refuge of statues unattached. One of the first will be the monument to the gallant Harvelock. The mischief is that the strong sentiment in favour of our departed heroes induces upon our limited space objects that are entirely out of place, and anything but creditable to our knowledge of art. The reverence for the Duke of Wellington prevented the horrible edifice from being removed from the arch at Hyde Park, and the sentiment of gratitude to the defenders of Isakmanian will probably be strong enough to preserve the unsightly and nauséous obstruction at the bottom of Waterloo-place. There is another long piece in the completion of this last and greatest deformity of the metropolis, but I fear it is not in anticipation of its improvement or its removal. In spite of objections to constrained or despotic authority, there must be some control provided against the desecration of our thoroughfares.

The removal of the statue of King Charles is again mooted, on account of the increasing necessity for providing a continuation of the Strand through St. James's Park. But it is behind the Nelson Monument that it ought to be placed, instead of in front of the column, as some not very practical critic has proposed.

I am glad to say that steps will be taken in due time to provide for bringing before Parliament a real project for the embankment of the Thames between Westminster and London on both sides of the river. The matter is not exactly so described by a Sunday contemporary. But things are in preparation for all that. It has been proposed to appoint a Royal Commission. We have had Commissions and Committees enough. There has been plenty of talk; it is now time that something should be done. We believe that the work will fall to the Metropolitan Board of Works, who will be required to continue the sewerage with the embankment. They will have the necessary funds wanted, but they will, of course, be placed under the control of the Chief Commissioner of Public Works. The activity at last exercised by the Metropolitan Board, in pushing on the works of the high-level sewer, has abated the hostility felt against them, and the usefulness of the subway at Covent Garden has improved their character for greatness.

I have learned from the best authority, that the gossip about Mr. Tom Taylor's connection to the *Titanic*, as dramatic critic, is entirely unfounded. It is not even well contrived. Mr. Taylor is so profuse a producer of works for the stage, that this alone would render it impossible for him to undertake the office, even if his other avocations allowed him. Nor is there any falling-off in the capable and experienced critic who has so long conducted this department of the leading journal.

The first of the winter Cabinet Councils is summoned for Tuesday next, when domestic matters and the Bills to be introduced next Session will be considered, as well as the important questions of Foreign Policy. One of the first and most important measures to be proposed will be a Bill to Amend the Proceedings in Bankruptcy and Insolvency, which was dropped last Session, but which will be introduced in a more comprehensive manner next year. Notwithstanding that some knowing ones shake their heads and say no, another attempt will be made to Reform the representation of the people in Parliament, and to get rid of some of the anomalies and abuses of the present system.

The Attorney-General will move in person for a writ, in the Queen's Bench, *ad nihil inquirendum*, in the matter of the Road child-murder. If granted, a commission will be issued by the Lord Chief Justice, as high coroner of England, composed of barristers and officers of the court, who will proceed to the spot, and pursue their inquiries with authority and knowledge of the law and the constitution, which seems to have been very little observed in some of the late proceedings that have been so irregularly recorded to. A technical difficulty may arise in the fact that the coroner's jury have already returned a verdict, which, however unsatisfactory, is perfectly true, against "some persons unknown." But the generally felt anxiety for a full and complete investigation, will probably outweigh any mere formal objection.

RURAL ECONOMICS.

THE YIELD OF THE WHEAT-CROP.

Is this country the yield of the wheat-crop in any year is everybody's question. To the labourers and working classes a good yield brings abundance, full employment, and full wages; while the country bespeaks comparative scarcity, scanty demand for labour, and reduced wages. To the merchants and manufacturers a short yield of wheat is synonymous with dear money,—i.e. high rates of interest, diminished trade, and low or no profits. To the bankers, the capitalists, the money-dealers, and jobbers of all kinds, a bad harvest is the prelude to falling currencies, disastrous speculations, and inevitable losses; it is therefore perfectly intelligible that the newspaper press which represents the money-dealing and jobbing interests of the metropolis, should, throughout the late disastrous harvest, persistently misrepresent the actual state of the crops and the effect of the bad weather, by declaring, in all manner of forms, by correspondence agricultural reports and leading articles, that there was no harm done to the crops, and thus after all, the season of 1860 was not a bad one." This had probably some effect on the less informed, and enabled the shrewder speculators to "get out," at the expense, probably, of those trustful traders who relied on their "disinterested" public instructors, and neglected to trim their sails for the coming gale. But facts are stubborn things, which must be ultimately recognized, though leading journals may mystify, distort, or conceal them for a time. Now, however, it is admitted that the wheat-crop of 1860 is deficient in quantity, weight, and quality. There has certainly been no year since 1816 in which the condition of the wheat in England has been so bad as it is this year. Nor could it well be otherwise; for a harvest never had beyond that of any harvest remembered, was gathered during a season wherein the intervals of dry weather were so short, and the year was so far advanced that it was physically impossible any wheat could be carried to the stackyard in good condition, and fit for immediate use. The only wheat which this year has been sown in England is undoubtedly the early crop, and beyond that the crops which had been cut, or were quite ready for cutting on the 30th of August, when about fifteen consecutive days of fine weather commenced. These could only be the early crops; and, compared with the total growth of wheat in England, form a very small proportion of the whole.

Let us look at the facts in the face, and we shall do far more to mitigate or avoid the evils consequent on a short supply of home-grown bread-corn than by any foolish and ineffectual efforts to act on public opinion by understating or misrepresenting the extent of the calamity. Free-trade has, happily, rendered this country not wholly dependent on home-grown wheat, and there is no doubt that the efforts that our merchants will prevent, by means of corn importations, any serious advance in the price of bread. The harvest is now concluded, and in ordinary seasons the yield of the wheat-crop would have been fully tested. This year, however, so little wheat has been threshed in some districts, that the actual degree of deficiency is not ascertained. In most of the agricultural districts, however, the crops have been sufficient quantity of wheat threshed to enable experienced local men to give proximate estimates of the yield.

In the absence of public agricultural statistics, inquirers into questions of this sort must rely on private enterprise. This has often been brought to bear on the subject by several of the weekly newspapers, and the *Standard* (publishing the past week special correspondence of the *Star* (daily newspaper) have given a summary "statement of the yield of the wheat, barley, and oat crop, so far as that can be estimated by private individuals conversant with agricultural questions, and acquainted with the general condition of farming matters in their respective districts." This statement, which is the result of extensive inquiries, and to have been carefully prepared. The conclusions to be drawn from it agree with our own more limited personal observations and inquiries. Availing ourselves of this statement, we shall offer to the reader a pretty correct estimate of the results of the late harvest as regards wheat, to which grain our remarks will be confined.

In the Midland Counties, the estimate from Banbury, Oxfordshire, is that the wheat will yield from 30 bushels to 40 bushels to the acre, and that the average weight is from 50 lbs. to 62 lbs. per bushel. These figures are somewhat wide, and certainly higher than in most of the midland counties. At Bicester, in the same county, the average yield is estimated at 24 bushels per acre, and the weight per bushel from 50 lbs. to 62 lbs. The Bedford estimates are 40 bushels to the acre, and 54 lbs. to 56 lbs. per bushel. At Grantham, 32 bushels to the acre is the estimated crop, and 56 lbs. to 62 lbs. per bushel is the estimated weight. At Newark, 27 bushels to the acre, and 55 lbs. to 62 lbs. per bushel are the estimates. Northampton returns 24 bushels per acre, and 52 lbs. to 61 lbs. per bushel.

In the Western Counties, Barnstaple gives only 20 bushels to the acre, and 50 lbs. to 62 lbs. to the bushel. At Bideford, 15 bushels per acre is stated as the average quantity, but the weight is given at from 60 lbs. to 67 lbs. per bushel. At Blandford (Dorsetshire), 20 bushels per acre and from 55 lbs. to 60 lbs. per bushel are the estimates. Devizes (Wilt), a large corn-market, returns 22 bushels to 24 bushels as the acreage, and 52 lbs. to 60 lbs. per bushel as the weight. Gloucester gives from 10 bushels to 53 bushels as the quantity, and 50 lbs. to 63 lbs. per bushel as the weight.

In the Home Counties, Maidens (Essex) returns 14 bushels to the acre, and 50 lbs. to 60 lbs. as the weight of the bushel. In Hertfordshire, the estimate is 28 bushels per acre, and from 54 lbs. to 60 lbs. per bushel.

In the Southern Counties, Southampton gives 24 bushels per acre, and from 48 lbs. to 60 lbs. per bushel; Brighton, 22 bushels to the acre, and from 52 lbs. to 60 lbs. to the bushel; Bournemouth, 22 to 30 bushels per acre, and 54 lbs. to 61 lbs. per bushel; Rochester, 22 bushels per acre, and 54 lbs. to 63 lbs. per bushel; Faversham (Kent), 36 bushels per acre, and from 50 lbs. to 60 lbs. per bushel.

In the Eastern Counties the Cambridge estimate is 24 to 44 bushels to the acre, and 56 lbs. to 63 lbs. to the bushel; Boston (Lincolnshire), 26 bushels per acre, and 56 lbs. to 64 lbs. per bushel; Norwich, 32 to 36 bushels per acre, and red wheat, 57 lbs. to 63 lbs.—white, 60 lbs. to 63 lbs. per bushel; Lincoln gives the extraordinary estimates of 3 quarters to the acre, and from 26 lbs. to 36 lbs. to the bushel; Ipswich, 35 bushels per acre, and 52 lbs. to 61 lbs. to the bushel; Beccles (Suffolk), 25 bushels to the acre, and 50 lbs. to 62 lbs. to the bushel.

And lastly, in the Northern Counties, Newcastle-on-Tyne gives 24 to 29

bushels per acre, and 52 lbs. to 63 lbs. to the bushel; the Durham estimate, without specific figures, gives "under average;" Kettering, 34 quarters [95.33] to the acre, and 56 lbs. to 60 lbs. to the bushel; Middlesbrough (Yorkshire), 33 bushels to the acre, and 56 lbs. to 63 lbs. to the bushel.

At Bradford, Wilts, it is stated the farmers refused to give any information respecting their crops. The Chesterfield correspondent says, "it is too soon to ascertain the average of this district, as our harvest is only just closed, and very little is in a fit state to be thrashed;" and it is stated that several of the small farmers have thrashed, and the yield has been only 9 or 10 bushels per acre, weighing from 50 lbs. to 55 lbs. the bushel. The Exeter correspondent states that in the north of Devon the ordinary yield of wheat is about 5 bushels to the acre. At Wakefield "a very large proportion of the samples brought to market are totally unfit for human food." The Lincoln report says that the plant was good in Lincolnshire, and up to blooming time "droup brooms were entertained of a favourable result;" but the cold rains of July and August injured the crops, and "the result is that the apparently abundant crop is much damaged both as to quality, weight, condition, and quantity, and it is thought that the food-producing value of the crop is one quarter below an average." Several reporters state that no wheat has been thrashed in their districts in consequence of its bad condition.

These selections form a fair sample of the sack. It is impossible not to be struck with great differences between the lowest and highest quantities estimated as the produce per acre, and still more with low weights per bushel. Wheat of 50 lbs., 56 lbs., or even 58 lbs. per bushel, is necessarily inferior in food-producing power; and the universal estimates made of such weights indicate in terms not to be mistaken that our present wheat-crop will prove more deficient than any crop we have had for many years past.

TEMPLE BAR.

The *Corinth* Magazine is about to have a rival in *Temple Bar*. Wisdom cries aloud in the street, we are told; and literature seems to look for its title in our thoroughfares. The City is not barren of associations that might furnish a name to a periodical; but how *Corinth* is more connected with letters than the *Pentecost*, we do not see, perceive, or care. For can we understand how *Temple Bar* has been taken into grace by a publisher; is it a good omen to start with a name derived from a nuisance? *Temple Bar*! the only literature connected with it, is the fortnightly weekly paper in the hairdresser's shop, that forms part of the absurd fabric. But we are told that, from among Messrs. Child & Co.'s old ledgers, that are stored over the archway, the future editor has, in his mine eyes, seen Dr. Johnson and "Gold," passing under it. But did the great Doctor make *Temple Bar* a literary monument by walking through it? Is it, therefore, academical, and as the porch of Plato? It was only the highway after all; and the same stones have been trod by other celebrities: Dr. Dodd and Mrs. Brownrigg, most of the Directors of the South Sea Company, of the equality and ruffianism of London generally, from the time it was built to the present hour. What association can *Temple Bar* have with literature, more than any other portion of the way between Charing Cross and Abchurch Lane? Or with Johnson, most of the great English writers who have lived, and passed this point, and the scene of a great deal of skrimishing. The Piedmontese brigandage occupying the houses of a little village at one end, while the Papal troops were under cover of some buildings near the gate; but they evicted make a feeble resistance, and the condition of the citadel itself confirmed us in this impression. Here Lamouricé had collected upwards of 4,000 men, and occupied a position which, under ordinary circumstances, would have involved a protracted siege. Unfortunately for the French general, he had not a sufficient force to occupy all the heights which command the citadel. From these his outposts were driven in detail, and the Sardinian artillery was brought to bear on the citadel, while the Papal troops in vain attempted to rise to their cannon were so ill-furnished and unsteady, their artillerists so raw and inexperienced, that the odds were fearfully against the *gariboldi*. Still there were not enough *schabols* to warrant the capitulation; and however hopeless in the long run the general might have felt his situation to have been, we cannot but think, looking at the comparatively unglorious state of the fortifications, that he ought to have taken a little more punishment before giving in.

Fortunately for ourselves, Frenchmen do not seem to be endowed with that description of courage which enables them to make a determined and dogged resistance in the face of ultimate inevitable defeat. When we remember that in 1848, the people of Lyons, unaided by military leaders, held out against 70,000 Austrians for forty-two days, we can scarcely reconcile the capitulation of General Lamouricé and 4,000 men to the Sardinian army in fifteen days, with the slightest of valor. A Chinese force would certainly not have laid down their arms on so slight a provocation. It is true that in addition to imperfect guns, and still more imperfect gunners, Lamouricé had to contend with disaffection among his men.

It seems that discontent existed among the Austrian officers, who were almost in a state of mutiny, while the Italian section of the army proved treacherous, and the Swiss were not to be depended upon. The French and Irish would turn out in these colours, but most of the French had been killed at Castel Faldardo; and of 180 Irish who were in the fort, not one had the slightest conception of how to load a gun. I gathered some of these particulars from some of the wounded Irish soldiers whom I visited in the hospital. Of the night who had been wounded originally, only three remained, the others having been sent home. The hospital, which was a church, contained about 600 wounded men, among whom the doctors averaged about one a day. The Papal soldiers occupied one side of the building, the Sardinians the other. From their own account, the Irishmen had no reason to complain of their treatment. They said that no difference was made between them and the Sardinians, and that they had more cause of complaint against a countryman of their own than against any foreigner. One of our friends had, it appears, proposed to assist upon these walls in the night, and the poor lad, for two of them were boys of eighteen, had intended that he would take all his money, with which he was to supply them with comforts not

it be done without damage to the properties adjacent, we should like to plant an Armstrong sixty-eight pounder, on the cab-stand at St. Clement's Church, and thence, during the night, batter the whole thing down by a few well-directed shots, so as to have every stone carted away before morning! Why keep up a permanent barrier, in a London thoroughfare, that is nothing, besides the nuisance, but a foulner road to a bank, and a buttress to a barber's shop!

A TOUR THROUGH UMBRIA AND THE MARCHES.

ROME, 21st OCTOBER.

The events which have recently occurred in Umbria and the Marches may render some account of a journey which I have just accomplished through those provinces interesting to your readers. The King of Sardinia had passed through Ancona only a few days prior to my arrival in that town, and the flags with which the streets were decorated still remained as evidences of the enthusiasm with which he had been received. Those who remember Ancona only under the *spina* which has now passed away, would scarcely recognize, in its busy, crowded streets, and boisterous, cheerful inhabitants, the solemn and depressed population of yore. The people seem to have been relieved of a great weight, and can scarcely realize the existence of their newly-acquired liberty. The *cafés* are crowded with a gaudy, noisy multitude; and in the evening the streets ring with the sounds of movement and song. Individuals just released from protracted incarceration shake you cordially by the hand when they meet you, although entirely unknown to them, and inform you that "they are free," an assertion which they emphasize with a "Viva l'Italia," and about which nobody who witnesses their exuberant antics can have the least doubt.

From the accounts which we had received of the siege of Ancona, I expected to find the city showing everywhere signs of the conflict. So far from such being the case, however, it required considerable investigation to discover whereabouts the fighting had been. The light-house certainly was surrounded by a heap of ruins. The fort, by which it had been protected, had been blown up by the fire of the Sardinian fleet, and one hundred and sixty persons had perished in the explosion; but the town itself was perfectly unscathed, and the few shots which had struck it were not visible to the casual passenger. I was assured, however, that the firing of the Sardinian men-of-war was incessantly laid that a large proportion of the shots intended for the fort and citadel had entered the town. The principal entrance to Ancona is through a very handsome archway, erected by the first Napoleon. Immediately outside of this is the Lazaretto, and here the traces of the fight were more numerous, though, considering that it was the key of the position, they were unaccountably few. Situated immediately under the guns of the citadel, and within stone-throw of them, it is incomprehensible how the Lazaretto could have been held by the Piedmontese for the last twenty-four hours of the siege. Yet it is evident, from the appearance of the building, that the assaults who succeeded in driving the Papal garrison out were subject to no very heavy fire themselves. The main road to Brindisi, which passed this point, bore the scars of a great deal of skirmishing. The Piedmontese brigandage occupying the houses of a little village at one end, while the Papal troops were under cover of some buildings near the gate; but they evicted make a feeble resistance, and the condition of the citadel itself confirmed us in this impression. Here Lamouricé had collected upwards of 4,000 men, and occupied a position which, under ordinary circumstances, would have involved a protracted siege. Unfortunately for the French general, he had not a sufficient force to occupy all the heights which command the citadel. From these his outposts were driven in detail, and the Sardinian artillery was brought to bear on the citadel, while the Papal troops in vain attempted to rise to their cannon were so ill-furnished and unsteady, their artillerists so raw and inexperienced, that the odds were fearfully against the *gariboldi*. Still there were not enough *schabols* to warrant the capitulation; and however hopeless in the long run the general might have felt his situation to have been, we cannot but think, looking at the comparatively unglorious state of the fortifications, that he ought to have taken a little more punishment before giving in.

Fortunately for ourselves, Frenchmen do not seem to be endowed with that description of courage which enables them to make a determined and dogged resistance in the face of ultimate inevitable defeat. When we remember that in 1848, the people of Lyons, unaided by military leaders, held out against 70,000 Austrians for forty-two days, we can scarcely reconcile the capitulation of General Lamouricé and 4,000 men to the Sardinian army in fifteen days, with the slightest of valor. A Chinese force would certainly not have laid down their arms on so slight a provocation. It is true that in addition to imperfect guns, and still more imperfect gunners, Lamouricé had to contend with disaffection among his men.

It seems that discontent existed among the Austrian officers, who were almost in a state of mutiny, while the Italian section of the army proved treacherous, and the Swiss were not to be depended upon. The French and Irish would turn out in these colours, but most of the French had been killed at Castel Faldardo; and of 180 Irish who were in the fort, not one had the slightest conception of how to load a gun. I gathered some of these particulars from some of the wounded Irish soldiers whom I visited in the hospital. Of the night who had been wounded originally, only three remained, the others having been sent home. The hospital, which was a church, contained about 600 wounded men, among whom the doctors averaged about one a day. The Papal soldiers occupied one side of the building, the Sardinians the other. From their own account, the Irishmen had no reason to complain of their treatment. They said that no difference was made between them and the Sardinians, and that they had more cause of complaint against a countryman of their own than against any foreigner. One of our friends had, it appears, proposed to assist upon these walls in the night, and the poor lad, for two of them were boys of eighteen, had intended that he would take all his money, with which he was to supply them with comforts not

furnished by the hospital. Instead, however, of doing so, "he eluded upon it," to use the expression of the narrator, and had never been seen since. Their account of the treatment they had met with on their first arrival entirely coincided with what we have already heard. One of these boys had been kept in a miserable dungeon for three weeks, but took the oath. At last his spirit was fairly broken, and he yielded, but five of his comrades were more determined, and held out for seven weeks, at the expiration of which time they were released, mere skeletons and covered with vermin, and allowed to find their way home. During their imprisonment they were beaten and cruelly tortured. None of the men were allowed to write to their friends, and many were the expedients resorted to to get letters posted. Some managed to escape by hiding on board steamers as they touched at Ancona, but the great majority were coaxed into submission, not, however, until they had furnished their persecutors with an idea of their pugnacious character. Probably it was for this reason that Lamoricière chose the Irish to repel the storming party, which he never waited to receive. One of my informants had not a leg, and bitterly bewailed the day he left his country to become an agriculturalist in Italy. "Sure he was to be a farmer in the Pope's country!" but, "if ever he got back, there's not a priest in all Ireland he would believe on his Bible oath, there's not!" He "came from a place they call Sligo, may-be I had never heard told of."

As the country between Ancona and Rome is restored to tranquillity, the diligence had again commenced to run, and I left Ancona with eleven fellow-passengers at eight o'clock one evening on that somewhat tedious journey. My compartment in the same compartment were two of the Papal police agents who, upon the taking of Ancona, were made prisoners by the Sardinians, and had been kept in confinement ever since. They made a grave story of their imprisonment, though by their own showing it consisted in being confined in a suite of furnished apartments. It was only fair that they should experience a little of the same treatment to which they had subjected so many others. One of them was a large broad-browed bull-necked man, with a massive jaw, and hair closely cropped over a low forehead; the other was a little ferret-like person, with thin features and a restless and fidgety eye, but a sinister curl of the lip. We became very good friends, but I found the infamy was not profitable to myself, as they were exceedingly reserved upon all professional matters, and disgraceful companions in a *cage*, where the mob identified me with them upon one occasion. For these men seemed known to every one, and many were the sarcasms at their expense, and insults to which they were obliged to listen in silence. Often, when we stopped, persons would come and speak to them in hurried mysterious whispers. They seemed suspicious of everybody, and full of important confidential information; but it was imparted so rapidly, and in such low tones, that I never caught what passed. I have little doubt, however, that their acquaintances were spies.

It was sorry to see among them several women. The only other person in the compartment was the wife of an officer in the Papal army, who entertained the most profound respect for the police agents, and who increased our party by two of the bravest cats I ever saw. She might as well have chosen the top of my head as these battle-field, and at all times were eminently disagreeable. The condition of a man who has been shut up for three consecutive nights in the *rotelle* of a diligence, with two police agents, two wild cats, and a stout female, who considers any reflection upon her cats a personal insult, is not enviable. However, I made the best of it by passing my days on the roof. Unfortunately, there is no *bonaparte* in an Italian diligence, I therefore was obliged to cling on to the tarpaulin outside the baggage as I best could. As I was on a level with the first floor of the house, the process of passing through a town was eminently exciting. The difficulty of dodging the lanterns so as to avoid being swept off by them—the nervous anxiety with which the approach to an archway inspired me, as the horrid spectacle forced itself upon me that it would be impossible to pass beneath it—and the great amusement which my necessary excursions created among the fairer portion of the community, who looked at me out of the first-floor fronts, jumping about like a dog on a hay-cart—were all experiences which I owe to the cats and the police agents. Upon all other occasions my elevated position was most agreeable. The country through which we passed was lovely in places, and presented the additional interest of being the scene of the late brave campaign.

We passed the corner of the battle-field of Castel di Fidene, so fatal to the Papal army, and picked up at Loretto a French gentleman and his wife, who had made a pilgrimage to the scene of slaughter, for they had but a son in the battle, and were bitter in their accounts of the barbarous treatment he had received at the hands of the Sardinians. For three days he had been lying wounded on the field of battle, and was then obliged to ride, though severely contused, for more than a mile; but his condition was not much, if at all, improved in the town, for the straw which kind-hearted people brought for us was kept from him by the Sardinians, who said that a miserable death was all that those who enjoyed the Papal cause deserved. The treatment which the Irish met with at Ancona rather militates against this doctrine; but such was the result of his inquiries, as related to me by my fellow-traveller. A Legistist of the old school, his whole sympathies were against his own Emperor and the Italian movement, and his views, as contrasted with those which one hears at every turn, interesting. The loss of the French brigade alone at Castel Fidene amounted to upwards of 600 men. My informant was thoroughly convinced of the truth of the fact so strongly insisted upon by General Lamoricière, that he had been assured of the support of the Emperor Napoleon, in the event of the Piedmontese troops entering the Papal States. This is confirmed by the language held by the Duc de Gramont in Rome not long since, who announced, in the hearing of several persons, that the Sardinian armies would be sent flying before the French legions; while the treachery of the Emperor may be traced from the feet of his latest son, Victor and Cialdini at Chiusi, just before going to Algeria, where he gave the latter to understand that the sooner he carried out his Papal campaign the better. The rudeness of the attack on the part of the Sardinians was doubtless one reason of Lamoricière's defeat, while his belief in the promise of the Emperor was another. It is one, however, which says little for his knowledge of the world.

In all the towns through which we passed were phoedra announcing the annexation, the vote for which is to take place on the 4th and 5th November. Many people had the "84" ticket already in their hats. Cockades were popular, and flags were hoisted, in anticipation of the great event. The towns are all in favour of annexation, among the peasantry, however, there is a spirit of sentiment. The change from the despotic to the liberal form of government is never so much felt by the uneducated as by the educated classes. Thus, the peasantry were always happy and contented under the Pope, and paid no taxes, which they will now be compelled to do. The consequence is, that there is a strong feeling against annexation among them. We found Spoleto, the scene of the prowess of the Irish, very enthusiastic. I could find scarcely any traces of the skirmish, for the action here does not merit another name. At Narni the whole population was parading the streets; files of women were carrying flags, lads were playing, and little brook-birds were sent floating over the country.

Whoever would take a prominent part in a national demonstration, we have a guarantee of its quiescence. The contrast which the real enthusiasm of this part of Italy afforded to the sham enthusiasm of Savoy and Nice during the late vote, was very striking. There is at present no frontier to the Pope's dominions in this direction, and in consequence we drove into Rome without ever having been asked for our passports,—the only change is from a Sardinian to a French scrutiny. The first French jurisdiction is at Civita Castellana; but throughout the whole journey scarcely any soldiers were visible. It was with no little satisfaction that, after fifty-four hours' jolting, and an interval of many years, I found myself running once more over the Piazza del Popolo.

IRON-SIDED SHITS AND THEIR DESTINES.

WHETHER iron casting be or be not possible as an efficient coating for war-ships, is, according to Sir William Armstrong, a question purely and simply for naval architects to determine. If vessels iron-clad can be made to steer as well, float as well, sail as well, and perform other necessary duties as well as ordinary war-ships, then, according to him, the day for old-fashioned wooden walls have gone by. Curiously enough, as it may seem, Sir William's rival, Mr. Whitworth, holds an opinion the very opposite. He roundly proclaims iron coating to be useless. He says no system of iron plating that of a war-ship can carry is strong enough to resist the action of shot and shell.

We believe neither Sir William nor his rival to be exactly in the right, notwithstanding that each has pronounced an opinion directly antipodal to that of the other. Sir William's dictum begs the assumption: that it is not within probability cannon will be made much stronger than they are; whilst Mr. Whitworth tacitly assumes the proposition for granted, that whatever increase of thickness be given to plates of iron and steel, a corresponding excess of power can be given to cannon. Now, there is clearly a limit to the magnitude and efficiency of cannon, and to the thickness of iron and steel plates, and what we have to determine, from consideration of evidence at command, is which of the two limits can be most easily attained.

First, as regards to artillery, whether any one material employed in cannon manufacture—be it iron, be it bronze—there is a limit beyond which not only does no increased thickness of material conduce to strength, but is actually a source of weakness. Beyond certain limits, not only does increased thickness not impart more strength, but it actually detracts from strength; so that a smaller bore may actually be excavated out of a larger bore with actual gain of resisting power to internal pressure. To state arbitrarily the exact limit of bore up to which a cannon may be made is impossible. In general terms, however, it may be stated that a 68-pound solid shot is the largest spherical projectile which can be discharged with safety from a cast-iron gun.

Now a 68-pound unripped piece of ordnance has a bore, the diameter of which is 8.12 inches, and the gun itself weighs 95 cwt. The British and other services have cast-iron guns much larger, but they are for the projection of shell, not solid shot. It is of great importance to remember that the strength of any given ordnance material must be considered in reference to the sort of projectile it is designed to project. Hence shell-guns can be safely constructed of dimensions altogether beyond the limits of safety presented by natural laws for solid shot guns.

If, however, elongated or bullet-like projectiles be in question, then the bore of the gun must be proportioned to the length of the projectile. Consequently, the strength of the gun must be proportioned to the length of the projectile, independent of the weight of the elongated shot. We take for granted the position that elongated shot and shell would be rifled. A contemporary has of late given place to some articles, written by a well-known ironmaster, the purport of which is to show, on historical grounds, that the rifling of great guns is not indispensable to the projection of elongated shot and shell. Well, the mind must needs respond to the evidence it has sought and found, and has deemed conclusive. Again and again have we witnessed experiments performed with the object of obtaining a true flight for elongated projectiles from unripped guns. Again and again the result has been utter failure. No sooner do the elongated shot and shells depart from the unripped barrel than they topple, flying wild—all accuracy of direction gone. We quarrel with no one's opinion; but, for ourselves experiment has left no room to doubt that a gun to shoot elongated shot or shells with accuracy, must be a rifled gun.

The rifle principle enables the artillerist to increase the weight of his projectiles, without proportionately increasing the diameter of his guns. Moreover, inasmuch as weight for weight, an elongated projectile, flying point foremost, meets with less resistance from the atmosphere than a spherical projectile, rifled bolts of enormous weight can be hurled to unprecedented distances, with comparatively few changes. Thus, quite recently at Shoeburyness, a muzzle-loading rifle gun of ordnance construction, by the Messrs Iron and Steel Company for Mr. Linnell Thomas, accomplished a range of ten thousand two hundred yards at 27° of elevation, with 22lb of powder; the projectile weighing 190 lb.

There was a time when the idea prevailed that the function of missiles of bore in diameter was relatively to the weight of projectile, might be taken advantage of within wider limits than artillerists are now disposed to credit. With the exception of some inventors, who committed themselves to the small

borne idea very demonstratively at the beginning, artillerymen now concede that the power of a small-bore cannon to throw a heavy shot is narrowly circumscribed. The general belief now is that no elongated projectile can advantageously be made considerably longer than three diameters. The conditions which impose this practical limit are various. Firstly, it has been determined that every increase of length in the projectile requires a corresponding increased elongation of rifling, which increases the friction. Secondly, if the projectile be a shell, the closer the powder charge in that shell is, the more effective. Thirdly, there is a limit imposed on the practical elongation of a rifle bolt by the circumstance that throughout its flight the angular direction of the line of fire is maintained; so that at considerable elevations the heel of a rifle bolt, not to speak of a fine point to strike on a horizontal plane, as illustrated by the following diagram:—

It would be difficult to cite examples of public error more general, or more persistent than in relation to the powers of artillery. For instance, experiments are made with rifled ordnance, and an enormous range is achieved. Experiments are again made with the same piece of artillery, and with the object this time of demonstrating its penetrative power. An iron-sided floating battery—the poor, fatal *Trusty* is the mark—and the *Trusty*'s sides are perforated with the same sort of missile, out of the same sort of gun, which demonstrates the enormous range. Thereupon we are assured. Because a certain rifle cannon—anybody's rifle cannon, Mr. X's rifle cannon, that our remarks may be impersonal,—because the rifled ordnance of Mr. X. can achieve a range of five miles, and because Mr. X's rifle-cannon bolts have pierced the *Trusty*, ergo the *Trusty*'s iron sides are wholly untrustworthy against the bolts of Mr. X's cannon. Now, the fact is, so far as we are cognizant of the experiments performed—and we believe we are cognizant of all—no one cannon-shot, shell, bolt, or other projectile, rifled or unrifled, has ever yet smashed its way through the iron sides of that poor ill-used *Trusty* at a distance beyond four hundred yards—nay, we believe it will be found that the greater number of missiles were fired at distances not much exceeding two hundred yards. At five miles the rifle-bolts of Mr. X. or Mr. Y. (we really mean nobody in particular), would have struck against the *Trusty*'s iron sides about as harmfully as a China orange against a coal-van.

The question now is why the *Trusty*, offensively as well as defensively armed, should ever have permitted a wooden ship, armed with rifled the guns of Messrs. X, Y, or Z, to come up within pistol-range!

Mr. Whitworth lays great stress on the punching effect of his hardened bolts with flattened heads. Doubtless this method of penetration is very efficient whenever conditions are such that the punching power can be brought to bear. That power attains its maximum when the axial line of a rifled bolt strikes the resisting surface at right angles. Even approximately this can only happen at point-blank range. In proportion as the trajectory is more curved,—in other words, as the distance increases—so will the punching action diminish, as is illustrated below.

Even a hole clean cut by one of Mr. Whitworth's flat-headed bolts is not, according to Sir Howard Douglas, a dangerous hole; and here, whilst on the subject of Whitworth's cannon-bolts, the circumstance must be noted with regret, that the applications of that gallant officer and excellent artilleryman to Mr. Whitworth for authentic descriptions of gun projectiles, and practice with the same at Southport last summer were made in vain. The result has been that Sir Howard, gleanings his information from Mr. Whitworth's book, has fallen into the error of assuming, naturally enough, that the Whitworth cannon is now hexagonally bored, with a twenty-four sided; the projectile is skittle-shaped, and at its thickest part is what may be called an imperfect hexagon. The windage of Mr. Whitworth's present cannon being great his shooting is inaccurate. Near twenty shots being fired at a target 1,000 yards distant, on Southport sands, the target was not once hit. As for ricochet practice, Mr. Whitworth's cannon is like every other rifled cannon. Exactly as Sir Howard Douglas states in his fifth edition, there is, and seemingly must be, a deflection at every range laterally from the vertical plane of the trajectory. As regards time of loading, the Whitworth guns were seen to be very slow. Nearly every tin cartridge case had—on the authority of one present—to be dug out of the breech by a handspike; and the friction-tubes, being actually launched thirty or forty yards to the rear, would have incapacitated the guns from actual service in the field or on shipboard.

For the sake of simplifying the general issue, we are content to assume what is by no means conceded; we are content to assume that *La Gloire* is as glorious a triumph of nautical skill as ever breasted the waves. We are content to assume that English shipwrights will not improve upon *La Gloire*; we are willing to believe, during the half-hour or so that our pen is wandering over paper, committing to it these thoughts, that every sailing, steaming, steering, and fighting capacity ever claimed for these iron-bound ships is to the full demonstrated and conceded. Well then, matters being so, the lucky sea-captain of a wooden man-of-war, set face to face over against the iron-sided monster, would have a precarious time of it. Assuming the ordnance power of each vessel equal, the practical result of mutual attack would give this difference, viz., that whereas iron sides might, and indeed would, plump live shells through the timbers of wooden sides at long ranges,

the latter, on her behalf, could plump nothing whatever, neither shot nor shell, through the iron sides of her adversary, save at short ranges—barely four hundred yards. These would be uneven terms indeed: the result of it is not difficult to foresee. Wooden walls could not hold their own against such fearful odds.

Be it remarked, the very indefinite phrase, "long range," crept into the web and woof of this narrative. We mean long potential ranges, such as, for the purposes of the illustration in hand, could be practised from the port-holes of a man-of-war. Sir William Armstrong, speaking before the Society of Civil Engineers, could not see, he said, the use of firing rifle shells up into the clouds, not knowing when or where they would come down again. Neither do we, on our part, see the use of it: some people do; and the pretty experiment would not be repeated so often. Until the present laws which affect and govern natter are assimilated, extremely long ranges must require extremely high elevations—say, for rifled long guns, elevations of 20 degrees or thereabouts. Now, considering that elevations of not more than 8 or 9 degrees can be got out of the port-hole of a man of war, it follows that for good or evil—for well or woe—the idea of 20 degree ranges for broadside guns must be abandoned. Nay, if the idea of Colonel Cavalli, of the Sanluis service, as explained in this journal the week before last, be carried out, then the ranges capable of being accomplished, would become still less considerable. The smaller a ship's portholes can be made, the less exposed would the vessel be to ravages of missiles not potent enough to smash through a mail plate, though terrible when finding their way through a port-hole; and the same time, exactly in proportion as portholes are reduced in size, so does the power depart of muzzle elevation—another form of expression for long range flight.

Assuming, as we have done, that iron-sided ships can and will be constructed equal in all nautical requisitions to wooden-sided ships, then the whole interest of the iron versus wood question, so far as ships alone are concerned, concentrates itself within the limits of that transition state when rival naval powers are all doing their utmost. All war-ships iron-clad with plates, equally strong, the strength of all war-ships would be equal. Of far greater importance is it to determine whether iron protection would or would not affect the war relations now subsisting between war-ships and fortresses. We must, however, postpone the consideration of this subject to another occasion.

ASTRONOMICAL NOTES FOR NOVEMBER.

The Sun rises on the 10th at 7 h. 11 m., and on the last day at 7 h. 44 m. He sets on the same days at 4 h. 16 m. and 3 h. 53 m. respectively. The Moon is new on the 13th, and full on the 28th.

The planet Mercury is ill situated for observation. Venus is a morning star, rising about four hours before the sun: and she is near the moon on the 11th.

The planet Mars is an evening star, and is at his greatest distance from the sun on the 10th at 6 h. 35 m. p.m., and on the last day at 5 h. 55 m. He is near the moon on the 20th.

Jupiter rises at 11 h. 13 m. p.m. on the 10th, and about four minutes earlier each successive night, and is visible throughout the night after these times. He is near the moon on the 7th.

Saturn rises on the 10th about half an hour after midnight; on the 20th at 11 h. 40 m. p.m., and on the last day at 11 h. 10 m. p.m., and visible through all the morning hours. He is near the moon on the 8th. There are no phenomena of interest during the month.

THE WEATHER IN OCTOBER.

THE cold weather, which had prevailed throughout the whole summer, continued with but slight exceptions to the middle of October; a change then set in, and the weather afterwards was fine and warm. The average pressure of the atmosphere at the height of 180 feet for October is balanced by a column of mercury of 29.96 inches in height. The reading of the barometer at the beginning of the month ranged above this value till the 10th, then passed below, and continued below till the 19th, and was above its average after this day. The mean reading for the month was 29.96 inches, being 0.17 inch in excess above the average.

The average daily temperature for this month is 54°; and in the month was actually 54°; and this is the first time since May that this element has not been below the average.

The average low night temperature is 43°; and for the month was 43°. Therefore both the days and nights were warm.

The usual daily range of temperature for October is 14°; the value of this element for the month was 14°, being one-half of a degree below; and this was caused by the warmth of the nights. Till the 10th day the daily temperature was below its average value, with the exception of the 3rd, 5th, 6th, and 7th days. The deficiency on the 11th was 10°, and on the 12th no less than 12°. From the 17th the temperature was above its average, with the exception of the 20th and 21st, which were a little below. On some days the excess amounted to 8°, 9°, and 10°.

The average mean temperature of the month is 49°; the observed value was 50°; showing an excess of temperature above the average of 1°; and this is the first instance since May of a warm month.

The degree of humidity for the month was 89, upon a scale in which complete absence of water from the air is represented by 0; and when saturated is represented by 100. The average for October is 87, so that the air was slightly more humid than usual.

The relative proportions of the direction of the wind were—N.W. 3; W. 7; S.W. 15; N.E. 2; E. 3; and S.E. 1; and, if referred to the four cardinal points, are—N. 3; E. 2; S. 8.11; and W. 15. The prevalent wind for the month was therefore S.W.

The air moved with a velocity of 200 miles daily; the greatest horizontal movement on any one day was 510 miles on the 19th, and the least was 60 miles on the 28th.

Rain fell on ten days to the depth of 1.6 inch, being 1.2 inch less than the average. The amount of rain from January 1 is 267 inches, exceeding the average by 57 inches.

The temperature of vegetation, as shown by a thermometer on grass, was below 30° on three nights, between 30° and 40° on fifteen nights, and above 40° on thirteen nights. The weather, from the middle of the month, was the finest in the year. It would be very desirable, with a view to help to find a physical cause for the great deficiency of temperature this year, to collect from ships an account of the presence of icebergs in connection with the direction of the wind at the time.

JAMES GLAISH.

NECROLOGY OF EMINENT PERSONS.

THE EARL OF DUNDONALD.

On Wednesday, October 31st, at Kensington, in the 85th year of his age, the Right Honourable Thomas Cochrane, Earl of Dundonald, Baron Cochrane of Dundonald, Lord Cochrane of Paitu and Ochilvie, in the Peerage of Scotland, and a Baronet of Nova Scotia, G.C.B., Grand Cross of the Imperial Brazilian Order of the Cruzeiro, Knight of the Royal Order of the Redeemer of Greece, and of the Order of Merit of Chili; Vice-Admiral of the White and Rear-Admiral of the United Kingdom. This venerable nobleman, one of the most interesting characters that ever adorned the British navy, was the eldest son of Archibald, ninth Earl, by his first wife, the daughter of Captain James Gilechrist, R.N., and died on December 14th, 1775.

When only five years of age he was reared on the looks of the *Terriva*, bomb-rudder, commanded by his uncle, Captain Cochrane. He afterwards succeeded to a captaincy in the 7th Foot, but never joined his regiment; and on the 27th of June, 1780, embarked with his relative in the *Hind* of 28 guns. On the 17th of May, 1795, as acting-lieutenant of the *Thetis*, 42, he contributed to the defeat of a French squadron off the coast of North America, and was confirmed to that ship 24th May, 1796. After serving in various ships he joined the *Queen Charlotte*, flag-ship of Admiral Lord Keith, in the Mediterranean, and on the 21st of December, 1799, he was sent from Gibraltar Bay, in command of the boats of the *Queen Charlotte* and *Essex* frigate, to relieve the *Levy* sloop cutter, then surrounded and attacked off Calcutta. Point by point French privateers and Spanish gunboats, some of which he pursued and boarded with the most indignant gallantry, chasing others under the very cannon of the harbour. During the next ten years he distinguished himself by a series of daring exploits and victories, obtained at the greatest disadvantage of numbers and circumstances, and secured a reputation for valour and conduct almost unparalleled in the annals of the service. For his destruction of the French fleet in the Basque Roads, April, 1809, he was made a Knight of the Bath; but his opposition to the Government as Member of Parliament for Hereford and Westminster, and his French gambles, some of which he pursued with promotion; and some fraudulent stock-jobbing transactions in which he was unhappily involved led to a trial, in which he was found guilty, sentenced to a heavy fine, a year's imprisonment, and to stand in the pillory. The latter punishment was, however, remitted. He was deprived of his title, and the Bath in the most ignominious manner, his lance being kicked down the steps of Henry VIII.'s Chapel, according to the ancient fables in such cases. He also lost his rank in the navy, and was expelled the House of Commons. Westminister, however, again chose him for its representative, and he broke out of prison and appeared in his place in the House. In 1818 Lord Cochrane accepted the command of the South-American fleet of Chili, and subsequently of that of the Brazilian Emperor Dom Pedro, by whom he was, in 1825, created Marquis of Maranhão. In both these positions he added to his already great celebrity for gallantry and good fortune. He afterwards served in Greece during the years 1827 and 1828; and on the accession of the Whigs to office in 1830, under King William IV., he was reinstated in his rank in the British navy, from a feeling that he had been made the victim of party animosity. On the death of his father, 1st of July, 1831, he succeeded to the family honours as 10th Earl of Dundonald, and became Vice-Admiral of the Blue 23rd November, 1841. In 1847 the Order of the Bath was restored to him. In 1851 he became Vice-Admiral of the White, and in 1852 became-Admiral of the United Kingdom. His lordship, just before his death, had completed a most interesting autobiography, in two volumes. By his Countess, Katharine Frances Corbett, daughter of the late Thomas Barnes, Esq., of Rufford, Essex, whom he married August 8th, 1812, and who survives him, Earl of Dundonald was left a daughter—Theresa Maria, now Countess of Dundonald, born April 18th, 1814; 2, Hon. Honore Bernard William Cochrane, born 1818; Captain the Hon. Arthur Anckland Cochrane, R.N., C.B., born 1824; Lieutenant the Hon. Ernest Grey Cochrane, R.N., born June 6th, 1834; and the Hon. Katherine Elizabeth, born December, 1821, married to John Willis Fleming, of Stoneham Park, Hants, Esq.

ADMIRAL SIR CHARLES NAPIER, M.P.

Tuesday, November 6th, at Merchiston House, Humevale, co. Hants, of dysentery, in the 75th year of his age, Sir Charles Napier, K.C.B., Vice-Admiral of the Red, and M.P. for Southwark. Sir Charles was the eldest son of Captain the Hon. Charles Napier, R.N., by his first wife, Katharine Elizabeth, daughter of Gabriel Hamilton, of Westbourne, co. Lanark, Esq. He was born March 6th, 1786, entered the Navy as a first-class volunteer in 1799, on board the *Merrit* sloop of war, Captain the Hon. Matthew St. Clair, and was removed the next year to the *Benson*, 74, flag-ship of Sir John Barham Warren. Served at Ferrol and in the Mediterranean, and in November, 1804, he was midshipman of the *Orythodon*, 32, Captain William Hoste. In 1805 he was appointed lieutenant of the *Courageux*, 74, and assisted in the capture of the *Morogo*, 68, and the *Albatross*, 40. In March, 1809, he was nominated acting-commander of the *Pallua* brig, and confirmed to it in the West Indies on the 20th of November following. During the three next years he distinguished himself on several occasions, particularly in an action with

the *Diligente* French corvette, 22, in which he was severely wounded, his thigh being broken with a shot, but refused to leave the deck until the enemy took to flight, and at the reduction of Martinique, when with only five men he scaled the walls, and planted the Union Jack, in open day, on the ramparts of Fort Edward. He was made post-captain in 1809, and during the years 1810 and 1811 fought as a volunteer in the British army in the Peninsula. In 1815 he was made a Companion of the Bath, and remained in the service till 1829, when he was appointed to the *Galates*, 42, off the coast of Portugal. On the retirement of Admiral Boscawen, he accepted the command of the Portuguese fleet, and obtained a signal victory over that of Don Miguel, in consequence of which he was created by Dom Pedro Viceroy of the Bath, and remained in command of the Grand Cross of the Tower and Sword. In 1839 he was appointed to H.M.S. *Porpoise*, 84; and in 1840 hoisted his broad pennant on board of her as commodore, and after assisting at the memorable siege of St. Juan d'Acre in the November of that year, took charge of the operations of the fleet, and concluded an advantageous convention with Mehemet Ali. For these and other important services he was made a Knight Commander of the Bath, and included in the thanks of both Houses of Parliament. He received also from the respective Sovereigns the Cross of Maria Theresia of Austria and of the Empire of Russia, and the insignia of the Order of the Red Eagle of Prussia. In 1841 he returned to England, was appointed one of the Naval Aides-de-Camp of Her Majesty, and elected M.P. for Marylebone. He commanded the Channel Fleet for two years, and on the breaking out of the late war with Russia was appointed to the command of the Baltic Fleet, and decorated Bismarck. In 1850, on the death of Sir William Moleworth, he was elected for Southwark, and returned again to it after the dissolution in 1857. He married Eliza, widow of Edward Elers, Esq., R.N., by whom he leaves an only daughter, Elsie Fanny, wife of the Rev. Henry Jordell.

WILLS AND BEQUESTS.

Matthew Utiell, Esq., of Hanover Lodge, Regent's Park, who died on the 5th of October, whilst staying at Ostend, the native place of his wife, had executed his will on the 21st of the same month, being three days before his death; and only reached his 55th year. He has left a widow, and six children, of which the will was attested by his solicitor, Mr. James H. Cotterill, of London, and Mr. Giles Hilton, of Ostend. The executors nominated therein are his relict, together with James Hutchinson, Esq., of Angel-court, London, and his two brothers, Clement and Theophilus. To whom probate was granted by the London court, on the 1st of the present month. The personally in England was sworn under £250,000, which is exclusive of foreign securities and real estates. To his relict he has left a legacy of £40,000, and of life-interest in the residue, also the furniture and household effects and private sealings, to be divided equally among the children, but has directed that his old and valuable paintings, articles of vertu, works of art, and curiosities and antiquities, and all other rare specimens of every description, should be sold and form part of the residue. He gives his widow the option of residing in his house, or of the former residence of his late wife, or of either of whom he purchased the lease. To his brother Clement Utiell he has left an immediate legacy of £10,000, and a reversionary life-interest in one-fourth of the residue. To his brother Theophilus Utiell, £10,000, and one-fourth of the like residue absolutely. To his three sisters, namely, the Dowress of Devon, and those of their present husbands, and to each a share in the like residue, namely, to his sister, Madame Herchell, if she survives the widow, £5,000 absolutely; and to each of his other sisters the income arising from the two remaining fourth-shares, on the residue, on the death of his said brother and two sisters, will devolve on their children. There are a few other legacies and annuities to relatives and friends, and to two of his old and faithful servants. All legacies to be paid to be free of legacy duty.

Mr. Utiell had received the following distinguished honours and decorations; namely, The Order du Citron (of the Oak) of the Netherlands; the Order of Leopold of Belgium; and the Order of the Legion of Honour of France. He had been the projector and principal instrument in carrying out many of the great continental railways, and was for many years a director of the London and South-Western Railway Company.

John Brewitt, Esq., late of Bridgehouse, Wickford, Essex, died on the 4th of September last, having executed his will on the 8th of July, 1859, and a codicil in June this year. By his will he had nominated as his executors, his wife, together with his son-in-law John Greenwood Snagden, of Eastwood House, Keighley, Yorkshire, and William James Bredwell, of South Weald, Essex; but by his codicil he substituted for the first-named executors the Dowress of Devon, to whom he named as an executor, Mr. Edward Falford, of North Bantock, Essex. Probate was granted on the 5th of November by the London court to Mr. Bredwell and Mr. Falford, the acting executors. This is the will of a highly respectable gentleman, who, it is said, possessed a large estate, and he has bequeathed to his wife, for her maintenance, a stamp duty at £20,000. His relict being provided for under the will of her late father the testator merely leaves her an annuity, together with the furniture and household effects, and the horses and conveyances which were in use at his death. His son also survives, and he has bequeathed to him the will of his late uncle, being provided for, he gives him a small legacy as a token of regard; and the testator, having bestowed a marriage portion on his eldest daughter, he has directed that his firm and estates should be sold, and that the whole of the property, with the above exceptions, should be divided amongst his three unmarried daughters equally.

Edward Goldsmith, Esq., of Blenheim Lodge, Northfleet, Kent, died on the 24th of September last, without having made any disposition of his property whatsoever, leaving, amongst other things, personal property requiring representation. Under these circumstances it became necessary to take out letters of administration, and accordingly the widow obtained the same from the London Court of Probate, and which were granted to her in the beginning of the present month, which will enable her to administer the assets.

Sydney Peel, Esq., formerly of D'Urbain, in the colony of Natal, South Africa, and late of Deal, in England, where he died on the 20th of August last, had made his will on the 16th of September, 1857, and a codicil in the following month, appointing executors to act in England, and other executors to act in Natal. The executors for England are Edmund Peel, his brother, and John A. Peel, his brother-in-law, and the testator left Natal being Henry Milner and William Smerdon. The will was proved in London on the 30th of October, and the personality in this country sworn to as under £4,000. This gentleman appears, by successful enterprise as a merchant or otherwise, to have realized a handsome

property, as he has acquired very considerable possessions in Natal, which he has devised and bequeathed, together with his personalty, amongst his family; he has directed that his property in South Africa and other parts should form one fund, and the whole be divided into seven parts equally amongst his three brothers and four sisters. There are legacies left to his executors at Natal.

The Reverend Richard Pantis, Chaplain to Her Majesty's Indian Army, Bengal Establishment, died at Agra, in the East-Indies, on the 31st May last, having made his will on the 19th of the same month, which was attested by J. Whistall, Surgeon, and William O'Connell, Her Majesty's Indian Army. A copy only, and not the original, signed by Major C. Warde, Cantonment Magistrate, Agra, has been sent to this country to be administered to and acted upon, until the original arrives, and which has been sworn to by the executor, Mrs. Elizabeth Drake, of Denville, Devon, and a limited probate granted by the London court on the 26th ult. There are two other executors appointed in India, namely, Captain Edward Hume Thompson, Bengal, and Lieutenant William Owen. The will is very short, and the testator has directed his executors to distribute and divide his property amongst his four daughters, subject to his discretion and judgment of his executors, regard being made by them with respect to their age and other circumstances.

Captain William Jones Prowse, R.N., late of Enham House, near Andover, Southampton, and of Yoxford, Somerset, who died on the 10th of October last, at Enham House, and made his will on the 18th of November, 1850, to which he added three codicils, bearing dates respectively in 1851, 1856, and the 21st of July of the present year, contained bequests to the value of £40,000. The following are the bequests:—"To my wife, who is amply provided for under marriage settlement, he leaves the occupation of his residence, Enham House, with the furniture and other household effects, horses and carriages, as well as all other effects not elsewhere disposed of, for her own absolute use; but the plate, books, prints, and pictures, he bequeaths to his daughter, whom he has devised all his real estates, and has left him the residue of the personalty; and he has bequeathed to his youngest son the sum of £25,000, in addition to his share and interest in the property under marriage settlement, on the decease of his mother.

Reviews of Books.

SYDNEY SMITH.*

THE character of Sydney Smith's writings is essentially English—English in expression, turn of thought, and sturdy homeliness. His predominant quality was shrewd common sense. It towers over all his other qualities. But it was common sense lightly seasoned with imagination, and tinged with a dash of wit, which imparts so peculiar a charm to his productions. The practical application of his powers was limited to certain classes of topics. His range was not wide, but he was master of the domain to which he was drawn by choice as much as by the force of circumstances. The most conspicuous of these was the subject of religion, that he was the original editor of the *Edinburgh Review*. When Jo and Jeffrey began their joint morning in Edinburgh, having nothing to do, with a large stock of available capacity running to waste, Sydney Smith proposed that they should set up a Review. The proposition was at first met with some hesitations, and he was appointed editor. Luckily for himself, his literary life, his tenure of office terminated with the first number. He left Edinburgh, and Jeffrey became his successor. It was not the reading world alone—political and literary—that benefited by the transfer. Sydney Smith himself was a still greater gain. Of all men, he was one of the least qualified for the functions of editor. He wanted that calm judicial temperance, which is indispensable to the conduct of a public journal, and which Jeffrey possessed in an eminent degree. His sympathies were not so catholic as those of Jeffrey. The liberality of his principles would have led him over many difficulties; but his liberality was too vehement and intolerant to enable him at all times, and on some subjects, to judge dispassionately. The unavoidable failure of selection, of watching the current of events in order to choose and time his strictures, of hitting the Cyprian of the hour, and of embracing in one comprehensive view, the social, literary, and artistic tendencies of the age, would not only have been out of his diligence, but in his reality beyond his grasp. But these very defects which disqualified him for the editorship of the *Edinburgh Review*, were the very qualities which rendered him so successful and brilliant contributors. Perhaps no writer ever knew so well the line in which his excellence lay; and, being left free by his liberation from the obligation to follow his own taste, he escaped the mistakes and failures that are common to mere doctrinaires. Sydney Smith's liberality was not a liberality of jurisdiction was supreme, whatever he did was done well. You might detect a quivering or a wavering, or an effort to get up the requisition energy or enthusiasm anywhere. All is decisive and spontaneous. He is always in earnest, always bright as youth and wise as age, always as fresh and vigorous as in the beginning. His special fitness for whatever he took up (which he took up because he was fit for it), made him so happy in its execution, that, like Galahadi, it might be said of him, that he always seemed to excel in that which he happened to be doing; although, unlike Galahadi, it could be said of him that he excelled in a variety of departments. His aims were all, more or less, homogeneous. He could not have produced a comedy; he could as soon have written a pantomime as the "View of Wakefield;" and verse and natural history were equally out of his way. He had no invention, and very little imagination. But his essays glow with nervous, clear, and flexible style, and, in addition to his classical resources, ample stores of knowledge in the directions in which he chiefly wanted them, supplied the solid material out of which he worked a series of criticisms and discussions that will long continue the temporary occasions to which most of them were addressed.

They do Sydney Smith injustice who regard him principally as a wit. His wit served merely as wings to his sagacity. There were some of his contemporaries who said as sparkling, bright, and some white, as Sydney was strong, so far below the surface. His conversation abounded in pleasant snugs, which made the sides ring; but at the bottom there was generally a subtle suggestion worth the thinking of afterwards. In this respect his conversational habit had something of the nature of the highest order of Irish wit. When, for example, he says of a

young man who was going to marry a widow double his own age, and of an exhortation saying that the thing is impossible—"You mean that he is going to marry a part of her; he could not marry her all himself!" we are reminded of clusters of Hibernian anecdotes, containing similar absurdities, looking equally reasonable on the surface; as when the sister, who has committed some delinquency, runs up the street to catch her punishment, and, being asked by a passer-by, "You might just as well say 'Come down, you scoundrel, and I'll give you a dozen,' quizzically replies, "Troth, then, I wouldn't come down if you were to give me two dozen." But the joke about the fat widow, as reported in the volume before us, is equalled by simplicity and force of simile, and having indicated the point where the wit might lie, we hear, Sydney Smith is made to go on in this fashion elaborating and weakening it at every turn: "It would be a case, not of bigness, but of trigpiness; the neighbourhood or the magnitudes should interfere. There is enough of her to up the street to catch her punishment, and give it up, as much as you might give a colony with her; or give an assembly with her; or perhaps take your morning walk round her, always provided there were frequent resting-places, and you are in rude health. I once was rash enough to try walking round her before breakfast, but only got half-way, and gave it up." Or you might read the Riot Act, and declare her a riot; in short, you might do anything with her but marry her." This is American rather than Irish or English, and we should be much more disposed to believe that it was written by Mr. Prentiss than spoken by Sydney Smith.

His wit upon paper is not of this kind. It is exhaustive enough when occasion serves; but it never rides down a verbal fancy in this way. It appears only to the greatest advantage, and is always most luminous, when it lights up the serious side of his nature, which was his delight. It was his habit to read a large number of need hardly remind our readers what these were were. England has undergone a sea-change since Sydney Smith began to write, and the questions which in his day attracted the largest amount of attention, are now interwoven with the tems of the present month. The personal property laws, from age to age, have been consigned to the limbo of eternal oblivion. It would be as easy to say to common Canning's moral impossibility, the restoration of the Heptarchy, or to re-enact the laws against witches, as to re-enact any one of the wrongs or fallacies, great or small, against which Sydney Smith fought and conquered. It is not only the country which the country has undergone the last great step, as much as you might read the Riot Act, and declare her a riot; in short, you might do anything with her but marry her." * The Wit and Wisdom of the Rev. Sydney Smith. A Selection of his most Memorable Passages in his Writings and Conversations. London: Longman & Co. 1860.

* Equal rights to marginal positions, equal justice to the rich and poor: this is what men come out to fight for and to defend.

* No innovation? To say that all new things are bad, is to say that all old things were bad in their commencement; for all the old things ever were or have been, in that sense, were not new once. Whatever is now established, was once innovation.

* Words are an essential barrier to the reception of truth.

* There is one piece of advice in life to which I think no one will object to; and that is, every now and then to be completely idle, or to do nothing at all.

* Mankind are always happier for having been happy; so that if you make them happy now, you make them happy for ever, by which I think no one will object to.

* Most readers will be surprised at the unexpectedly small proportion which the extracts on public questions bear to those on social and moral subjects. The reason is partly to be traced to the intractable nature of political writing, which is not favourable to axiomatic forms; but also to that practical turn of mind which constantly curbed the politician into the more useful place around him, and which bestows the chief surviving value on those golden sayings.

ANCIENT DANISH BALLADS.*

A by no means unimportant agent in the reaction against the long-established usurpation of classical taste was the revival of the old ballads. Percy, in his "Reliques," was among the first to reawaken an interest in that ancient and elusive form of poetry which, though long forgotten, had only to be presented to the public notice to be welcomed with enthusiasm. Ever since the publication of the heterogeneous, but delightful, volume of the worthy Bishop of Downham, an extraordinary stimulus has been given to our nation's love of song.

Southey, Scott, Wordsworth, and Ball had all acknowledged their obligations to the author of the "Reliques," and probably there has been no one of our poets who has not drawn largely from the same inspiring source. But the revived appreciation for ballad poetry has not been confined to England. Besides our own countrymen, the various Norse dialects, the Spanish, the ancient Provençal, and modern Germany have all in their turn been ransacked for their treasures of ballad lore. But there is still a series of national ballads which has as yet little known and valued, at least in our own land. While the *Sagas* and *Eddas* of our literature are tolerably familiar to all who pretend to an accurate knowledge of English history, the Scandinavian ballads, though long since deeply appreciated in Germany, have been hitherto familiar to but few of our countrymen. The cause of this ignorance has been the naturally small number of students of the various Norse dialects, and the comparatively minor political importance of the Scandinavian kingdoms.

A few of these ballads have appeared from time to time, dispersed in various publications, but, hitherto, we have had no approach to any connected series of them. Hence, in the volumes before us we have a most agreeable surprise in the shape of nearly two hundred Danish ballads of considerable antiquity and much literary merit, and rich in allusions and illustrations of the highest interest to archaeologists. Although we have not the opportunity of comparing the original ballads with the work before us, Dr. Prier's spiced versions (less evident marks of fidelity).

Dr. Prier tells us in his very instructive preface, that the revival of the ballad literature of Denmark has done as much for the poetry of that country as Percy's "Reliques" has for that of our own.

* To those who would study the valuable literary works which Denmark has produced during the last fifty years, a knowledge of these ballads is essential. . . . Denmark has reaped the inspired gift of classical mythology, and, trusting to these, her own resources, has produced a literature which, we are told, was the greatest which she has ever known. . . . The Danish ballads, with which we shall see in these volumes so many unexpected marks of resemblance to the legends and the same manner for dance-tunes. . . . Our own good ballad would imply a similar usage.

Indeed, it may be said, generally, that poetry in its infancy was always accompanied both by the song and the dance; the etymology of the Greek *xypis* shows this.

Some difficulty has been felt with regard to the antiquity of the ballads included in the volumes before us.

Johnson, Geijer, W. Grimm, and other authorities of weight, have been led to attribute a very remote origin to these poems. Dr. Prier, however, considers the most ancient among them to be no older than the thirteenth century, and seems to be of a much more recent date. He quotes, in support of this opinion, the following remarks of Sir Walter Scott:—

* To the further our researches are extended, the more we shall be prone to believe that the romantic ballads of later times are, for the most part, abridgements of ancient national traditions, inserted in a much later date.

This observation as to ballads generally applies, without question, to many of those Danish ballads which have clearly been taken from the ancient *Eddas* and *Sagas*. But Dr. Prier shows that it is also true with regard to another very large class of these ballads. He has taken the trouble to examine with great attention the ballad-poetry of other countries, and, he thinks, most satisfactorily made out that many of these ballads exist in various forms in different languages. So far from being exclusively Danish, they are found sometimes with but little variation in the ballads of France, Spain, Germany, Italy, and even Brittany.

The correspondence of so many of the Danish ballads with those of foreign countries shows "that they were merely a portion of the fictions common to all West-European countries during the middle ages."

The dates of many of these foreign ballads are known, so that those of the corresponding Danish ones can be determined. As for those ballads which are exclusively Danish, their dates are tolerably clearly shown by the allusions to heraldry and other civilisive usages contained in them.

* Whatever may have been the period at which the Danish ballads first came into vogue, it is evident, from the language, that it was not till the fifteenth century, at least, that they assumed the form in which we now have them. It is probable that the *Sagas*, and *Norwegian* and *Faroese* ballads originated at the same time, for they all treat of the same subjects. In regard to several of them, the sources of the material are distinctly marked. The romance of "Tristram" was translated into Norse by Bratler Robert, at the command of King Håkon Håkonson, and as he lived in the thirteenth century, we may be sure that he has been concerned to have furnished many situations and incidents to the ballad writers. The poems of Martin de France were also translated into Norse by command of that monarch, but, like a second source of incident. . . . But these few works and several others, which were translated in order of the king, were numerous lyrics and romances floating about in every part of Europe, the common property of all nations, and it cannot be doubted that these found their way to Denmark too, and furnished the material for ballads of a more popular character. . . . All the subjects seem to be those to which we have been accustomed in the ballads of other nations, viz., courtship, architecture, and even in hand-writing. It is not only the tales themselves that are so widely spread. The same forms of expression, the same conventional phrases, were common to all the ballad-poetry of Europe. The same was the case with the language.

These ballads accordingly afford us a most valuable picture of the manners and

customs of the mediæval North, entering frequently into minute details of costume and daily life. They are also especially rich in allusions to laws and legal customs, and generally give us a thorough insight into contemporary ideas and modes of thought. While remarking the general plain-spoken and unadorned language of these ballads, the translator pays a just tribute to their moral tone:—

* I should be doing injustice to these Northern nations, if I did not add that in the whole vast collection of Danish, Norwegian, and other Scandinavian ballads, there is not a single one of a degrading tendency. We shall estimate them and their popular literature the more highly, the more we know of the general depravity of the modern poets, who, in the name of the age, that the nature of licentiousness and elegance, of imagination even in guilt, of simplicity and sincerity are to be found in the poems of corruption. . . . The same is true of the striking and appalling. . . . No such charge can be made against our honest Northernmen.

Dr. Prier has distributed the ballads in these three volumes into four groups.—1, Heroic; 2, Legendary; 3, Historical; and 4, Romantic.

The Hero Ballads are those which have found most favour with the Danish scholars and writers. They are, for the most part, the oldest of the Danish or Scandinavian legends. Thus "Thor of Asgaard" (No. 1 in this collection), is taken from the "Edda," and "Sivard and Rynild" (No. 3) from the "Nielshagen-Lied."

The second group, the Legendary Ballads, are remarkable as exhibiting primitive and even superstitious ideas on religious subjects existing in a reformed country.

The third set, namely the Historical Ballads, are among the finest in the series, and, besides giving spirited narratives of real events, are particularly rich in allusions to civilisive and judicial customs.

The fourth division of these ballads, the Romantic, are those which will afford the most pleasure to the general reader. Their general theme is, naturally, love, with its joys and sorrows.

The Hero Ballads are, for the most part, too long for insertion here, while, at the same time, their interest depends very much upon the connected story which runs through them. The same thing may be said of the Historical Ballads, which are for the most part, rather lengthy, while mere quotations would give but a poor idea of them.

We have selected the following specimen from the Legendary group; it is No. 35 in the collection, and is a universal favourite throughout Scandinavia:

THE BURIED MOTHER.

1. Swain Dying he journey'd up the land,
And saw a lovely maiden stand;
2. And when he liv'd his home to share,
And seen the sweetest children there;
3. But staying through the land came Death,
And saw'd that gentle lady's breath;
4. Swain Dying rode up to the land,
And gain'd a mother's hand;
5. He was his bride, and home she came,
A grin and laugh to favour'd dame;
6. When from her glided 'twas the sleep'd,
The sweetest babe was dead and steep'd;
7. They staid, these little things, and cry'd,
But kick'd it them off 't' unloving bairn;
8. She giv' them neither love nor beer,
Alone and lone was her cheer;
9. She look'd after their holsters blue,
"Bury straw shall be the bed for you;"
10. She took away their fire and light,
"In kindling none ye shall sleep all night;"
11. They cried soon wailing till the ground,
Their mother heard beneath the mound;
12. She heard it, as in her grave she lay,
"But go I must, their pain to stay;"
13. At that a high thence she beat her knee,
"O, set me, Lord, my children see!"
14. And such her prayer and tale of woe,
That God in mercy to her go;
15. "But there on earth no longer stay,
When earth shall close the dawn of day;"
16. Out from her chest the stretch'd her bones,
And rent her way through earth and stones;
17. As though a way there glad he led,
Lead all the household host to the bed;
18. So reach'd her husband's courtyard gate,
And there her eldest daughter sat;
19. "O, daughter mine, who art thou here?
For I have long been dead and drear?"
20. As a contrast to this affecting story of domestic life, we insert one of the Historic Ballads, which breathes throughout a nobly civilisive spirit:

KING SWENKER THE YOUNGER.

1. Young Swenker rose before his lord—
In solemn council met;
And said his lord a pious tale,
The sum of all his woe.
2. "My brother has driven me from home,
And left the land of plenty;
But lend me you, my lord, the sum,
I'll repay my debt."
3. "Ay, Swenker, now I'll lend to thee,
And bid thee Swenker and Jule;
Better than thou art now on earth,
To be a blade, or a stone."
4. A great and noble man was King
One holy Sabbath day,
And seated he at the command,
And bid his troops array.
5. Young Swenker staid on his ship's prow,
And gazed on the round;
Of the king, he saw the king's face,
Or in these words he drew'd it:
6. Together rush'd those highborn lords,
And here they bade the king to be the two

These specimens will furnish a tolerable idea of the contents of these volumes, for which students of history, archaeologists, and lovers of poetry, will equally thank Dr. Alexander Prier.

* Ancient Danish Ballads. Translated from the originals by R. C. Alexander Prier, M.D. Three Vols. Williams & Norgate, 1885.

THE JACOBITE BALLADS OF SCOTLAND.*

This volume contains a very valuable additional chapter to the annals of Scotland. The ballad is not only the most popular, but also the truest exponent of the feelings, the sentiments, the passions, the prejudices, and even the morals of a people. In its romantic rhymes, its simple diction, and strong imagery, the historical student will learn how, at any particular period, the people among whose ballads circulated thought, and felt,—how they loved, or hated, scorned or endured those who exercised authority over them. As sturdy as the stags (*stags*), or official monitors (*official monitors*), the Jacobite ballads were the voice of the people, and especially an early popular ballad sung in the streets, or covertly chanted with closed doors, tells to him who studies it what were the sentiments, what the hopes, and what the fears of those who openly applauded or contemptuously listened to it.

The last thing of which a nation, which has once enjoyed the sweets of liberty, can be deprived by the rude hands of its conquerors, is its popular political ballad. The sentiment that cannot be uttered openly, and in plain prose, takes refuge in rhyme, or disguises itself in an allegory, and links itself to music. Wise to the people who are so oppressed by despotism, or so tortured by police spies, as to be deprived of that last vestige of freedom, for then a certain and inevitable change will take place in the popular mind. The political ballad being forbidden, its place will be supplied by songs that degrade, with their insinuations, all who listen to their corrupting sentiments. Despotism is always attended by demoralization, and the surest instrument to that demoralization is the vile and infamous ballad sung with impunity in the midst of an enslaved population.

The eye system has never so worked in this country as to prevent the circulation of political ballads, although there have been periods when the rancor of political parties ran so high that the most simple acts were often attended with fatal consequences to individuals; as for instance, in the time of King Charles II. it has been considered an act almost as heinous as high treason, to utter a ballad, or call a man "on the 30th of January;" and during the reigns of the two first Georges, both soldiers and civilians were regarded as disloyal if they decorated their breasts or placed an oak-leaf in the hat on the day commemorative of the Restoration.

From the abdication of James II. to the fatal day of Culloden, the country was shaken by the unceasing plots of the exiled royal family abroad, and of their adherents at home. It was a time of fear, and of suspicion to those who were in power. It was a time of fear and of hope to those who were in opposition, the friends of the Stuarts. We know what statesmen and warriors were then doing, but, how are we to ascertain what the people were thinking with respect to past and impending political struggles? We have no more means of reaching at a knowledge of that most important fact, for we cannot read the passions of the people, nor their most popular. But in the examination of those lyrical effusions, great caution and a very scrupulous exercise of judgment must be employed; for the Stuart royal family, unfortunate in all other things, were lucky in one respect—their cause, or rather, their animosity, against all the claimants to the throne, whelmed their luckless adherents, excited the sympathy of the best people of Scotland. The consequence is a vast amount of songs, that are truly Jacobite in spirit, but that were composed at a period when not only all chance of the Stuarts being restored was at an end, but even the possibility of their ever regaining the throne was remote. The ballads composed between 1688 and 1746 are realities. They are words that meant things, whereas Jacobite ballads composed long posterior to the last date are mere exercises of the fancy, as unimpassioned as an ode to "Fidelity," or "Chloe," or a poem on the power of the potato, that were made.

There is in all such inquiries as that in which the editor of this volume has been engaged another difficulty to be overcome, to which he has thus alluded:—

"Though Scotland has always possessed this character (a love of song and music), especially in the Lowlands, where the English language is spoken for the modern Scottish dialect is but a variety of the old English; the Jacobite ballads, however, are not only the pleasure of antiquaries to collect and preserve, are not of a very serious date. Many of the ballads may be ascribed to the 17th and 18th centuries, but they are certainly not older than the art of printing, which three-fourths of them are evidently not as ancient."

There is a great and a profound truth touched upon in these few words. What is it, we may ask, that has for so many centuries puzzled the most diligent of antiquaries in their researches into the ancient traditions of different countries? There are found in records, among Scandinavians, Teutons, and Arabians, songs, stories, fables, which, when analysed, are discovered to be at bottom the same, but in their details widely different; and yet each claiming, by the manner in which it is narrated, to be indigenous to the people, and to the very land in which it is circulated. The solution to the mystery is to be discovered in the fact, that as the body assumes the form of the food which it sustains, so it is with the mind—everything that pleases the fancy, or soothes the spirit, or gratifies the pride of man, he assimilates to himself or to his ancestors, or to the country in which he dwells, or to the times in which he lives; and so the song, tale, or fable is which found its first birth and sustenance in the arid sands of Arabia, when blown to the cold shores of Scandinavia, or into the deep forests of Germany, makes for itself a new abode, and creates new and fitting actors for the old myth, tradition, song, or story. And thus it is with the old popular ballad; its popularity continues, but as the old actors are forgotten, and the new actors are introduced, the well-known personages supply their place. The ballad is modernised; and there is great difficulty in distinguishing between the old composition and the modern imitation.

The value of the historical ballad consists in its giving a history of the time, as that history was actually written by a contemporary singer; for there is this distinction to be noted between the epic poem and the ballad: the epic is the 'triumph of the victor; the ballad is the rhymed expression of sorrow for the loss, treachery, and disasters of the defeated. The historical ballads in every language; but in Paganism there is little variety of being ranked as native poetry beyond the dramas of the Greek tragedians, and the 'Tristram' of Orvid.

It is not, however, to be supposed that the universal character of the ballad is sadness, grief, or despondency. Flashed by the misfortunes of a desperate cause, it exhibits its strength in the bitterness of the hatred, the rage of the enemy, and the scathing power of its satire. This is the editor's description of the Jacobite ballad-writer prior to the great conflict with the Hanoverians, and after it had been decided in favour of the latter.

"But, with them, was not the political nature here; but a soul at a better; not a thing that merely drew blood, but that broke the skull and smothered the brain. But after the fatal fight of Culloden, the voice of the coarse humorist, if not altogether silenced, was softened with pathos. There had been a time of stag and to do, but it had passed and the day of lamentation had succeeded it. The rhymers had flourished in one epoch, it was now the era of the poet. Hence for the various and various of the Jacobite ballad-writer, and the higher emotions which had hitherto found their expression in songs, ballads, and epigrams, and the like."

*The Jacobite Ballads of Scotland, from 1688 to 1746, with an Appendix of modern Jacobite songs. London and Glasgow: Richard Griffin & Co., Publishers to the University of Glasgow, 1860.

the echoes of national music that came from Scotland, came from saddened hearts, and from desolate and all but desolated graves."

Here, then, in this volume, is the authentic record of the national feelings at a most important epoch in the history, not merely of Scotland, but of the British empire. Assuredly such a collection is one of deep and thrilling interest. The greatest historian that ever lived did not deem the lyrical compositions of a people unworthy of reference, while the poet, who would find fault with the vanity of the Greeks and the apathy of the Romans for bestowing neither care nor thought upon what sustained and invigorated popular feeling—the historical ballad—"Canstauris albus barbara apud gentes."

This volume is a carefully edited. There is not only an introduction pointing out what has been done by others in the attempt to make a selection of Jacobite ballads; but each particular piece introduced into this volume has a preliminary notice pointing out the time it was written, as well as the circumstances under which it related to which it related. The editor has designated "the historical" ballads, are some of the compositions which the editor designates "modern Jacobite songs"—by Burns, Campbell, Cunningham, the Kitchin Shepherd, &c. What they lack in historical accuracy is more than compensated for by the sweetness of their poetry, and the purity of their sentiments. Scotchmen ought to prize this book; and by all lovers of truth and poetry it should be received as a welcome gift.

THE PRAIRIE AND OVERLAND TRAVELLER.*

To a person intending to emigrate to Australia or America, this is an invaluable book, and to one resolved upon remaining at home its perusal cannot fail to be amusing and instructive. The most curious information and the most strange and interesting facts are to be encountered at every page. What, for instance, is more odd to the London-reared reader (who finds for his money, in almost every street he passes through, a superabundance of the necessities and luxuries of life), than to be told that if he wishes to have vegetables with his dinner for the next three or four days, he must have them sent to him from the States, and then subjected to a very powerful press, which will remove the juice, and leave them like a solid cake, which solid cake is to be thoroughly dried in an oven, when it will become almost as hard as a rock. The value of the vegetable going through this process is, that "a small quantity of the size of a man's middle hand, when boiled, swells up so as to fill a vegetable dish, and is sufficient for four men!" The author declares that these "compressed vegetables" are the best preparation for prairie travelling "that has yet been discovered." A single nation might, before using boiled, or compressed, or solid vegetable, and it is not a station. Another delirium of the emigrant traveller, which is unknown to the stay-at-home Londoner, is designated "pemmican." We add Captain May's description of this foreign feat, feeling a perfect confidence it will not be one of the new dishes laid upon our altars and common concinnities at the next Lord Mayor's dinner.

"The pemmican, which constitutes almost the entire diet of the Fur Company's men in the North-west, is prepared as follows:—The buffalo meat is cut into thin slices, and hung up to dry in the sun, before a fire, it is then pounded between two stones, and reduced to a powder; this powder is placed in a bag of the animal's hide, with the hair on the outside, matted close, and the bag is then filled with the powder, and the bag is then filled with a little bear and tallow, it is a very wholesome and exceedingly nutritious food, and a very good preservative of the meat."

So much for the food of travellers and emigrants to the far west; and now for the costume most suitable for them. The coat should be short and stout, the shirt of red or blue flannel, the pantaloons of a soft woollen material, the socks woollen, with stout boots, "coming up well to the knees, so as to admit the pants." The cap (Saginaw, Marcy says) should be of deer skin, and lined with "buff," and "against rattlesnake bites." Here is the captain's picture of himself when travelling in very cold weather over the rocky mountains: the like of it has never been seen in Piccadilly, High Holborn, or the Strand:—

"I wore two pairs of woollen socks and a square piece of thick blanket sufficient to cover the whole of my body, and I wore a thick buckskin moccasim, and the whole was enveloped in a pair of buffalo-skin boots with the hair inside, made open in front, and tied with buckskin straps. At the same time I wore a pair of oil-skin boots, which most effectively prevented the air from penetrating to the skin, and made an excellent defence against frost and other evils."

The author of this work has passed more than twenty-five years in exploring the interior of the American continent. In his peregrinations he has been thrown exclusively on his own resources, and to sustain life, as well as to make progress, he has had to resort to various expedients. In this book he gives to the reader the benefit of his experience, advising the emigrant and traveller as to what they should do in the way of preparing for their journey, and warning them as to what they should not do, if they wished to escape from unnecessary trouble, and to avoid encountering themselves with needless labour. As these pages are all the experience, they will be found of considerable value to the persons for whose instruction they have been specially written.

MISCELLANEOUS NOTICES.

"A Thesaurus of German Poetry, with Explanatory Notes." By Charles Graessner. London: David Nutt, 270, Strand.—In this volume there are 450 pieces of poetry, by 120 different German authors, and all selected with a view to the requirements of school and private study. The volume is divided into three parts, extracts are preceded by a concise description of the principal periods in the history of German poetry, and a short critical notice of the chief poets from whose works extracts are made. In the volume will be found fables, parables, ballads, legends, poems, elegies, odes, sonnets, madrigals, dramatic dialogues, epigrams, satires, riddles, and epigrams. Thus, it will be seen, there are specimens of all kinds of poetry comprised within the plan of the compiler, who has given to the reader the advantage of appending explanatory notes to passages which he cannot understand, and to passages which he cannot understand. In his desire to leave no difficulty in the way of the pupil, Mr. Graessner supplies explanations to words and passages which, in our judgment, require no such elucidation; as, for instance, "we take our illustrations from a single page, p. 404," when he tells us that *die Hölle* in *den Schönen Tagen*, is a Germanism signifying "the hell," and totally inactive; that *der Hölle* means "the hell," and "the hell" is a Germanism; is synonymous with "the company of the lion," *der Löwenjäger*, *der Beierger Art Löwen*; *hockebrot*, "generous, high-minded;" *Prüfung*, "time of trial;" &c. The selections are made with taste and judgment; and considering that the volume is intended to be placed in the hands of young men, it is fully entitled to claim for it those most important recommendations; that all the pieces chosen by him are of acknowledged excellence, interesting in their subjects, and above all reproach in their moral tone. This book is entitled to admission into schools and families.

*The Prairie and Overland Traveller. A Companion for Emigrants, Travellers, Hunters, and Adverses Travellers Great Plains and prairie. By Captain B. Marcy, London, Low, Sons, & Co., 47, Ludgate-street, 1860.

"The Theory of Arithmetic." London: C. Dolman.—The object of this little book is to afford to those who have gone through a course of practical arithmetic, the opportunity of comparing the rational of what they learned in early life. It is intended to incite persons to a careful study of the theory of arithmetic. The value of this work has been already tested, for it is taken (as we are informed in the preface), from a manuscript which has been for some years used by the upper classes of St. Gregory's College, Downside, from which it emanates.

"Manual of Military Law." By Col. J. C. K. P. Kipon, Assistant Adjutant General at Head Quarters, and J. F. Collier, Esq., Barrister-at-Law. London: William H. Allen & Co., 7, Leadenhall-street.—The publication of this little volume is sanctioned by the Commander-in-Chief of the Army. It has, therefore, the advantage of being an official law-book on matters of vital importance to all the Queen's subjects who are serving in the army and militia, or have enrolled themselves as Volunteers. Its contents may be thus briefly stated:—It gives an account of the constitution, composition, and procedure of courts-martial; a detail of the crimes that may be tried, and the sentences that may be awarded by each description of court; a notice of the practice and procedure of courts of inquiry; a short exposition of the law of evidence; an abstract of the acts governing the Volunteer force; an account of the law relating to recruiting; a review of the duties, obligations, and liabilities of soldiers to civilians and the civil power; of the duties of civilians towards the military; and of the legal rights, privileges, and exemptions of soldiers. The highest authority at the Horse Guards has already declared of this volume, that "it contains much instructive matter," and also that it must be "a most useful addition to the books required by regulation to be in possession of the officers of the army." It is scarcely necessary to add, that being so recognised by the highest military authorities, a copy of it ought also to be purchased by every distinct corps of the Volunteers.

"The Volunteer's Manual of Health." By H. Smith, M.D. London: Ward & Lock, 125, Fleet-street.—One great, and most valuable consequence flowing from "the Volunteer" impulse that now pervades all parts of Great Britain, will be forcing the young men of the middle classes to society to develop their muscular strength by manly exercises. The leisure of the rich has at all times afforded them abundant time for such exercises, and the reports of the success of the poor in agricultural labours has made them a hearty and stalwart population. Both, when united together in the field of battle—the aristocracy as officers, the poor as soldiers—have by their courage and corporal strength, maintained the military fame of England. But it is only with the Volunteer movement that the middle classes have had the opportunity of exhibiting the courage that animates them. For the purposes of war bravery alone is not sufficient; there must be also the physical strength and energy to endure fatigue. That energy can only be acquired by a practice in gymnastic exercises; and the value of this little volume consists in the fact that it gives practical instructions for promoting the physical development of the human body.

"A Complete Practical Guide to Her Majesty's Civil Service." London: James Blackwood, Paternoster-row.—At a time when so many young men in all parts of the British dominions are desirous of possessing accurate information upon the various subjects on which they may have to undergo examination, to enable them to enter upon the civil service of the Government, a volume such as the present cannot fail to be of great service. It specifies the various offices in the service, the emoluments attached to each, the different subjects on which the candidates will be examined, and presents that which must be especially useful, specimens of the examination papers for every department, and also the appointments of the Commissioners. With this volume the reader is furnished with all the candidates; and, in fact, no one should think of becoming a candidate—that is, of exposing himself to examination and rejection—who has not made himself fully acquainted with its contents. The candidates must take things as they are. There is another question with which he has nothing to do, but upon which public opinion ought to be brought to bear, and that is the unnecessary tests of high education required from candidates for very humble positions in the public service—such, for instance, as letter-carriers, policemen, and salt-writers.

"Mary Rock; or, my Adventures in Texas." By Percy B. St. John. London: C. H. Clarke, Paternoster-row.—The name of "St. John" is one well known and respected in modern literature. It is connected with classical lore, with honest and consistent politics, and with more than one very agreeable contribution to light literature. The author of this volume has made himself by his American novels no unworthy rival to such writers as Cooper and Bird. The "Adventures in Texas" are fitting companions to the North-American Indian romances of the author; and some of them are laden with a vividness of power, and a minuteness of detail, that will remind the reader of some of the imaginary incidents in Paul Fretal's best story of "Les Contes d'Océ." Of the two, however, we give the preference to what seems to be the sincere statements of the English writer. With him there is the genuine whist with the Frenchman there is the constant straining after striking effects, no matter how much verities may be departed from, or probability sacrificed.

"Hankinson's Poems." London: Hatchard & Co., 187, Piccadilly.—The poems of the Rev. Thomas Edwards Hankinson, M.A. (late of Corpus Christi College, Cambridge, and minister of St. Matthew's Chapel, Denmark-hill), have now reached a fifth edition. These poems are mostly on religious subjects; and their author has been a vigorous and successful contributor to the *Quarterly Review* several successive years the winner of the *Scottian prize*—a prize given for the best English poem on a sacred theme,—but in 1851, the usual price of £40 was increased to £100, on account of the distinguished merit of the first poem in this volume, entitled "David playing the Harp before Saul."

"Clever Boys of Our Time, and how they became Famous Men." By the author of "Famous Boys," and "Heroes of Our Time." London: Darton & Co., 55, Holloway-hill.—This little volume is well adapted for a school. It contains a brief biography of Lord Macaulay, Faraday, Dickens, Cobden, Bismarck, George Cruikshank, Fairbanks, the brothers Chambers, Sir John Franklin, W. S. Lindsay, Joseph Hunt, Dargan, Heywood, Arago, Thomas Spencer, Sir D. Brewster, William Howitt, B. D'Israeli, Francis Horner, and Joseph Brotherton.

"Lays of the Reformation, and other Lyrics, Scriptural and Miscellaneous." By Jane Crowden, author of "The Singer of Enoch," "Aunt Jane's Verses for Children," &c. London: H. Colver, 187, Pall-mall.—The poems contained in these volumes realise the promise that is given in the title-page. To use the words of the author, they take up "a stray echo from the voice of history, and give it back in rhyme."

THE EDINBURGH REVIEW.

The new number of the *Edinburgh* contains nine articles—1, Recent Geographical Researches; 2, Memoirs of the Master of Sinclair; 3, Max Müller's *Antiquities of the Aryan Nations*; 4, *Grotius on the Sources of International Law*; 5, The Churches of the Holy Land; 6, The Great Remonstrance; 7, Scottish County Histories; 8, Brain Difficulties; 9, The United States and Mr. Buchanan. Of these articles two are devoted to national subjects, and both are of great interest. In the review of "the Master of Sinclair's" book, we have an account of a man—the variable word of a general—who is generally known as Walter Scott but at one time undertaken to edit, and yet, eventually, shrink from giving to the press, because it contained details calculated to offend the feelings of still surviving relatives of those whose names were introduced by the author in his "Tales of the Border." The moral of the story is, however, that his contemporaries, whether Whigs or Tories, Jacobites or Hanoverians, were a very base, a very selfish, and a very unprincipled set of men, and the author himself not one particle superior to the worst of the bad men he described. Such a denunciation of his country is not an epoch virtue in general, and it is in the midst of its perils and temptations men are seeking to ally themselves, not to what is most true, but what has the best chance of being finally successful. The article, "County Histories," tells a piece of news which will appear very strange to most persons, and that is the late period at which these have been completed a satisfactory map of Scotland. The article on "Brain Difficulties" is a review of Dr. Forbes Winslow's work upon "Insanity," which was noticed as "The United States and Mr. Buchanan" the writer takes a strong and decided part with "the Republicans" as opposed to "the Democrats" in the pending Presidential Election. We doubt the prudence of any such manifestation. The British people have no right to buy themselves with the internal politics of the United States, and the exhibition of a sympathy for a ruling class of public opinion with either of the American parties, at a moment when both are struggling for power, is—considering the jealousy that exists in the States of any foreign interference—more likely to injure than to serve the party in whose triumph the foreigner has expressed himself.

In the article upon "The Great Remonstrance," there is a review of Mr. Forster's very able work bearing that title. The *Edinburgh*, like the last *Quarterly*, takes advantage of the subject to discuss the wisdom of the proceedings of the Synod of the Presbyterians. The question raised is, whether, in the course he adopted? Those who think a republic better than a limited monarchy will, of course, decide the question in the affirmative. At the time when "The Great Remonstrance" was resolved upon, England had all the securities for a limited monarchy which she has at present, but then, there was the perfidious and treacherous conduct of the king to be guarded against. Was there no other way of defending public liberty but by the hazards of a civil war? But *Edinburgh* and *Quarterly Review* think there was. But then, if a republic was to be preferred to a monarchy even then, it was not finally secured. And whilst it lasted, what is to be said respecting it? There was the grand military rule of Oliver Cromwell—Mr. Carlyle's great hero. But how much mistaken liberty was enjoyed by Englishmen under the Protectorate of Cromwell! We say upon this point that the *Edinburgh* is right, and that King Charles's judges—who thus describe the state of England when Cromwell was at supreme rule in Whitehall, and had as his executive deputies a majority-general in every district in England—

"In the mean time the major-generals carried things with unadvised violence in their several provinces, and the army, who were not only not allowed to interfere, but were even prohibited from doing so, were themselves aggrieved; threatening such as would not yield their obedience with the severest orders with their swords drawn, and in the end, of West India, and suffering more to escape their persecution, but that those who betray their party by deserting, were persons that had acted with us for them."—*Lectures on the History of the English Republic*, vol. ii. p. 166.

"The Great Remonstrance" led to this state of things; and this again to the restoration of Charles II., and arbitrary power; and that, finally, to the Revolution, at which one of Pym's democratic projects was adopted; but, then, the state of things was restored to nearly the point at which it had arrived when "The Great Remonstrance" was determined upon. Events did not justify the policy of Pym, but they vindicated the propriety of the course adopted by Lord Falkland, and "the Constitutional party," that acted with him, back again, and for the king. It is not necessary to do more than refer to the articles on *Grotius*, *Geography*, *Sanskrit Literature*, and the Churches of the Holy Land, as being well worthy of perusal.

MAGAZINES FOR NOVEMBER.

THE most remarkable article in the *Cornhill Magazine* is dedicated to "Oratory." The topic is a large one, and has employed the thoughts and pens of able writers at all times. Cicero and Quintilian have dwelt upon it at some length, and the general character of the younger Pliny is to be gathered from his treatise on an oral discussion, or the composition of an essay, on the subject. The writer in the *Cornhill* has, however, nothing to say of such authors as Lylius, *Aschinas*, *Hyperides*, *Demosthenes*, *Cicero*, the *Grecoi*, *Cicero*, *Cicero*, and that most remarkable of all language-makers, of whom it was said (and the only one of whom it ever has been said) that "his best speech was his longest speech."—*Marcus Tullius*—"*Cujus oratio optima fertur esse que maxima*." Instead of the old-world orator, the writer in the *Cornhill* dwells upon the respective merits of such modern speakers as Lord Lyndhurst, the late Dr. Derby, Lord Glenelg, Mr. Spurgeon, and Mr. Parnell. The *Cornhill* contains two pieces of verse, which their writers and perhaps the editor consider to be poetry; a very pleasant "sonnet" upon, a valuable article on "Work," and the continuation of "Franklin's Diary." There are three other articles, and one of them is the first, Turner's remarkable picture of "The Country Blacksmith," engraved by C. W. Sharpe; the second, "The Lower Lake of Killarney," engraved by Wallis, from a picture by M. Anthony; and the third, "Paul and Virginia," engraved by J. H. Wallis, from the group by the French sculptor, J. B. Le Sueur. There is a series of very beautiful wood-engravings illustrating the picture of Raffaele, Mr. and Mrs. S. C. Hall's valuable and interesting companion guide (by railway) in South Wales, an account of the Amos Curzon, and a description of the Hudson from the Wilderness to the Sea. Amongst the purely literary articles next in continuation, not accompanied with either copper-plate or wood-engravings—we recommend to particular attention, "A Trip to the Art Exhibition at Brussels," "West the Monarch of Meliority," and "Leslie and his Contemporaries." Considering its attractions, both in original work and in illustrations, the *Edinburgh* is not a bad magazine for the lover of publications. There is in the present number of the *Edinburgh* an article that must prove interesting to every person living in this city. "Roman London" is a review of Mr. Koch Smith's truthful work, "Illustrations of Roman

THE IMPROVED PATENT HARMONIUMS.

MANUFACTURED BY ALEXANDRE & SON, OF PARIS.

CHIEF WHOLESALE AGENTS: METZLER & CO.,

37, 38, & 35, GREAT MARLBOROUGH STREET, LONDON,—W.

ALEXANDRE'S HARMONIUMS are universally admitted to excel all others in durability, and in the power and quality of their tone; and as they rarely require tuning, and give no trouble in their management, they are coming daily into more general use.

The following is a complete List of all the Instruments manufactured by them, forming a large Assortment, suitable for either the Church, School, or Drawing-Room.

PRICES.

| " 23.—In Oak Case, finished, with Gothic Organ Front and Gilt Pipes, rich full tone, (with Percussion) | " |
| " 24.—In Oak Case, with Twelve Stops (Four complete Rows of Vibrators), with 11-Octaves of Pedals (separate Vibrators) | " |
| " 25.—In Oak Case, with Twelve Stops (Four complete Rows of Vibrators) in the Treble, and Four in the Bass, Transposing Action | " |

A large assortment of the above-named Instruments always on hand.
N.B. No extra charge for packing.

WITH THE PATENT PERCUSSION, OR PIANOFORTE HAMMER ACTION.

The invention of the PATENT PERCUSSION ACTION has entirely removed the sole objection to these admired Instruments—want of rapidity of articulation when used for Pianoforte Music. It consists of a set of Hammers which strike the Vibrators at the same moment that the air is admitted, thus facilitating the execution of the most brilliant and rapid passages, and also producing a fuller and very superior quality of tone, and imparting to this instrument all the advantages of the Pianoforte.

SATURDAY, NOVEMBER 17, 1860.

[PRICE 3d.]

GARIBALDI; AND THE NEW KINGDOM.

THE mysterious impulses of Napoleon III., the daring ambition of Victor Emmanuel, the patient astuteness of Count Cavour, the honest heroism of Garibaldi, the dense stupidity of Francis of Naples, and the enthusiastic will of the Italian people, dissimilar and even hostile to each other as some of these have been, have all wrought together, like the ingredients of a stew in the hands of a scientific chef, to produce a wholesome and palatable compound. What no two or three of them could have achieved without the action of the rest, these chemical affinities and dissimilarities, warring and stirring, boiling and freeing, seething and fermenting, have at length accomplished. They have simmered, cooled, and solidified; and the world beholds the result in a real Italy; no longer a geographical expression, but an independent state, entitled to rank by its extent, its wealth, its intellect, and its population, as one of the Great Powers of Europe.

To Garibaldi, above all men, belongs the imperishable glory of this achievement; though to the Emperor of the French must be conceded the credit of being the main-spring of the machinery. Had he not sought a gratuitous and unprovoked quarrel with Austria on the 1st of January, 1859, the liberation of Italy would still have been a dream in the imagination of Garibaldi, Mazzini, Cavour, and the King of Piedmont. But the Italians owe him slight gratitude, and will perhaps need him none; for not even his greatest admirers venture to assert that he intended the unity of Italy. *L'honneur propose, et Dieu dispose*, is a favourite proverb, on the truth of which he has doubtless pondered "many a time and oft" since the great day of Magenta. To flatter the vanity of his nation, to prove himself as victorious in the field as sagacious in the council, to distract attention from his home politics, and to increase his European reputation, were, as far as the world can judge, the only objects that he proposed to himself when he poured his legions into Italy. He attained them all; but, like other men less magnificently placed, he failed, in due season, that conditions were attached to his success by a higher power than his own, which he knew them at the commencement, might have stayed his hand, and counselled him to quietude.

Not to glorify Garibaldi; not to dethrone the sovereigns of Tuscany and Modena; not to send the last and most worthless of the Bourbons into exile; not to exalt Victor Emmanuel to an eminence as brilliant as his own; not to create a strong power on the frontier of France to dispute with him the possession of the Mediterranean; not to fill the minds of his own people with the generous idea of liberty conquered for others, but denied to them, did he humble the pride of Austria. But all these things have come to pass, and, to do the Emperor justice, he seems to have reconciled himself to them with the dignity of a philosopher and the grace of a man of the world, acknowledging, perhaps, as other leaders of revolution have been compelled to acknowledge before him, in bitterness and anguish, that revolutions are easier to set in motion than to stop, and that great ideas are very dangerous tools for sovereign princes to play with.

The retirement of Garibaldi, after having delivered to Victor Emmanuel the kingdom which his simple honesty, his spotless heroism, and his epic grandeur of character had won, excites no surprise. But it did not need the proclamation of the patriot to his fellow-soldiers to inform the world that his retirement into private

life could be but temporary. It is better for Garibaldi, better for Italy, better for all Europe, that he should withdraw for a while from the arena of politics. The clean work has been done, and the dirty work is about to commence. It is easier to conquer kingdoms than to govern them. Government at best is but an unclean business, and ever will be so, as long as men are men, and are more eager to scramble for place and power, pelf and perquisite, rank, station, and pre-eminence, than to live honestly and humbly by the labour of their hands, or the honourable exercise of the talents which God has given them. And such a scramble, under circumstances of more than ordinary greed, animosity, and jealousy, is inevitable in the new kingdom, and will try all the proved statesmanship of the King and Count Cavour, to conduct to safe issue. Such men as Garibaldi are too pure and high to mingle in such work, or even to come into contact with the intriguers and schemers whose turn it now is to come upon the stage. For many reasons it is not only noble and generous, but truly politic and sagacious in him to withdraw for a while to his farm and his cattle, and hold himself in reserve for greater occasions. Italy is sure to need him; and that he may enjoy, for the sake of Italy, the health of body that will fit him for future enterprise, as well as the health of mind which always rewards and compels such disinterested and simple honesty, as his, must be the ardent wish of a far wider circle than is formed by the twenty-five millions of his grateful countrymen; of a circle that includes every friend of liberty both in the Old World and the New, and in the heart and memory of whom he is already ranked as a greater than Tell, and the equal of Washington.

In an article in this journal on the 15th of September—two months ago—while the great work was still unfinished and in danger, we could find no higher epithet to give him than "GARIBALDI—KING OF MEN." The world can give him no higher title now. He is more than a king or a king-maker; and though Victor Emmanuel may wear the crown, Garibaldi stands above him in his lonely Isle, holding a patent of unalloyed royalty, not from the King to whom he has given a kingdom, but from the universal conscience and consent of the great heart of humanity. To make him a Duke or a Grandee would add nothing to his station; but, on the contrary, would detract from his lustre. Such a man was needed in our age to rescue it from the reproach of corruption and venality—of self-seeking and man-mongering. Garibaldi—farmer, cattle-dealer, tallow-melter, sea-captain, soldier, and patriot—has thrown the glory of his name over every one of these avocations, and resented the least of them from meanness. It is no derogation from the glory of King David that he was a shepherd-boy—and none from that of Garibaldi that he manufactured candles upon Staten Island. Trust here of our day for many reasons, not the least of which is that he has dared to be poor—dared to gain an honest livelihood by the labour of his hands—dared in all things, and on all occasions, to show himself a MAN, irrespective of the great or the little world, and the world's opinion.

Let us hope that the General's farewell words to his comrades will not be thrown away upon the Emperor of Austria. If a million of soldiers be required in the spring of 1861, to wrest Venetia from Teutonic thralldom, the men will be ready if Garibaldi is ready to lead them. And ready he will be, as surely as he won Sicily and Naples. And Austria, if she persist in fighting, may lose not only Venetia, but Hungary; and the now proud Kaiser may find himself this time next year in as woeful and as hopeless a plight as his cousin of Naples,

and relegate the Hapsburgs into the same chapter of history as the Stuarts and the Bourbons. To expect him to make Venetia a present to Garibaldi is to expect too much; but if he have the least wisdom he will sell it, ere it be too late, to the King and people of Italy.

THE SUCCESS IN CHINA.

As was expected our arms have been triumphant in our first contest in China; and Lord Elgin, distrustful the mandarins deputed to negotiate with him, is on his way to Peking to dictate terms to the Emperor. Now, however, begins our real difficulty. It was never for one moment supposed that China would be able to resist the combined attack of France and England; but what will be the consequences of our success?

For an extraordinary period the empire of China has preserved an independent existence. The wild Tartars who have mastered its government at successive periods have been in fact subdued or civilized by the masses of China, and, preserving the empire entire, have become the direct heirs of its most ancient government. They have seized the reins of power to hold them after the Chinese, not the Tartar fashion. With some modifications they have fallen in with the manners of the old nation and have preserved its character, almost unbroken, to the present time. There is not in the world another example of such continuity of power and of such a homogeneous people as constitute the empire of China.

Originating at a period coeval with the most ancient nations known to European history, the empire of China has outlived them all. Assyrians, Egyptians, Greeks, Romans have all passed away, only leaving behind them undying thoughts and some few stone memorials of their existence, while the Chinese have flourished and grown through the whole period, which witnessed the birth and death of these other renowned empires, and now contribute about a fourth of the human race and occupy a large portion of the globe. They seem, however, now to be verging to that state of dissolution which pre-deceased empires successively underwent. Defeated by us, a prey to interior dissensions, a great insurrection founded on a religious principle raging through large districts of the country, China seems destined to break up like the Roman Empire, and to fall into the miserable condition of an old civilisation destroyed ere another has grown up to supersede it.

We cannot stop to inquire into all the circumstances which have led to the continual growth of this remarkable nation. We must, however, say that it seems in the main to have depended on that respect for industry—the source of all wealth and all subsistence—which is implied in the annual ceremony of the Emperor guiding a plough. It is clear that without industry no soil, however fertile, yields much abundance, and no people can become either numerous or civilized. Respect for industry, which is undoubtedly the characteristic of the Chinese, has been the source of their greatness, and is incompatible with that kind of slavery which existed in medieval Europe, and amongst the nations of what we call antiquity. It may therefore be inferred that this condition has never prevailed in China. At the same time, from the little we know of the country, it may also be inferred that the system of industry connected with the head of the State, growing from the State, and regulated by it, depends in all its parts on the preservation of the State. In China it seems the result of institutions; in Europe the system of industry has grown up in spite of institutions. We may therefore dread lest the overthrow of the State in China, which now seems imminent, should carry with it the disruption of this system of industry, and the desolation of an immense country and people.

We have to recollect that to improve the government, and teach the rulers of China respect for European and European usages—to curb Asiatic and Mandarin falsehood, presumption, and intolerance, we were forced into the war; and the very principle on which it was begun seems to impose on us the necessity of providing against the vast evils which seem likely to accrue from the dissolution of the state, provoked and forwarded by our success. The unexpected and unforeseen career of a mercantile company, compelled us gradually to make ourselves masters of Hindostan, and responsible for its government and welfare. With this example before us, and its consequences, we can but dread that we may be compelled, as a state, to follow in China the course of the East-India Company. The difficulties which such a prospect shadows forth, with a government not renewed for the wise administration of its own territories, colonial and home, may well appal the stoutest heart of the most ambitious statesman. We, then, are much afraid that with our triumph will begin a great and serious trouble.

All the issues are complicated by our entanglement with an ally. In common with him we must decide what is to be done. France and Frenchmen envying us the possession of India, may be desirous, what ever may be our views, to annex some portion of China, as it breaks up, and then we should be compelled to do like. We already possess Hong Kong, and, should the French establish themselves in the Chinese waters, the two nations may carry thither, as they formerly carried into Hindostan, their ancient rivalry, and the con-

tentions may be renewed there which in Europe public opinion will no longer tolerate. We would feign look cheerfully and hopefully at the triumph of our arms, but the probable consequences of our success excite in us the most serious apprehensions. We know, and the public must know, that great successes, as in the case of the first Napoleon, only hurry on decay and destruction; and we fear many disasters from the gigantic nature of a task which has been imposed on us; a task likely to be far greater than our national power to accomplish.

RESTRICTIONS ON CREDIT.

THIS is the age of free trade in theory, which necessarily causes in practice a considerable protective reaction. It is impossible for the whole people at once to come to the conclusion that each and every man should be free to seek his own advantage. Large sections of the people are in love with restrictions, and will impose them, though generally they have resulted in evil. The restrictions on the things which can be measured and weighed—such as corn, and wine, and iron—having been in a great measure given up as injurious, such persons have taken to restrict, or at least to try and restrict, immaterial things, which can neither be measured nor weighed.

The most vulgar of mortals think they can regulate the most ethereal elements of other men's life. So belief and thought have been here, and still are abroad, subject to numerous penal restrictions; and after such restrictions have been necessarily abrogated, the same class of men who formerly imposed them, now impose restrictions on confidence, or on credit, which is the expression of confidence. The extremely well-behaved, careful middle class, which at the close of the seventeenth century advocated the political restrictions on religious belief so obnoxious to their descendants, is now the advocate of restrictions on credit, money, and banking. No one can question their motives. They are animated by a strong desire to keep people honest, to guard against true excesses, to prevent rash buying, and preserve unchanged the measure of value. They have not succeeded; and are as ill-informed of the consequences of their restrictions as were their prototypes in the reign of Charles II. and William III. They will undoubtedly do as much mischief, though it may be of a different kind, as we now recognize to have ensued from the laws then passed against Papists and Protestant nonconformists. Protestants could not do so otherwise than proclaim the dogma of freedom of thought, just as *ad-fiant* free-traders proclaim freedom of trade; but both have practically violated the principle of their own lives.

Our legislature has solemnly recognized the utility of credit, by declaring a certain species of bank notes an actual payment; but then, like the magistrates of a German city, who recognize a guild, but will not allow a certain number of guilds, or like the town council, or, like the plan of licensing public-houses, which makes the trade legal, but limits the number of public-houses,—the Legislature limits the number of bankers who are allowed to issue notes, and limits the number of notes they shall issue. Now, it is notorious, that by no tradesmen is the public so ill served as by the monopolist and regulated publicans; and it is equally notorious, that the progress of industry in Germany has been retarded almost as much by guilds, and the limitation imposed in every town on the number of masters, as by the tolls levied by the Sovereigns on roads and rivers. The present moment, when the public is interested and perhaps aggrieved by a large rise in the rate of discount, seems appropriate to call attention to some of the consequences of a violation of principle by professed free-traders, which must be closed with the old laws against religious belief and against usury, and with the modern restrictions here on publicans, and abroad on all kinds of traders.

Following the lead of the Bank of England, the Bank of France last week raised its minimum rate of discount to 4½ per cent. Both bodies are the bankers of the State, and the Bank of France holds about £4,700,000, and the Bank of England £4,900,000 of the public money. Both are protected by law against competition, or have a monopoly conferred on them. In their favour other banks are prohibited from issuing credit-notes; but they are restricted by law in the amount they may issue, just as the licensed keepers of the Red Lion and *L'Escu* are guarded against unlimited competition, but must carry on their trade under police regulations. Now the deposit by governments of their resources in banks, enables them, like other people, to substitute credit currency for hard cash; and it would be of no importance to trade what amount of credit currency they abstracted from circulation provided there were no restriction on private individuals as to issuing credit currency. But this being restricted, and the currency which governments take from the public being deposited in banks which will only allow the public the use of it by paying for it, and which have a strong interest to enhance the rate of payment or discount as much as possible, it is clear that the greater the amount of taxation, the more of the limited credit currency goes into these banks for the respective governments, the more must the public pay these banks for the use of this indispensable but monopolized currency. Saying nothing further about the rival institution abroad

now competing with the Bank of England for gold in order to profit by restrictions, we proceed to show that the late changes in the rate of discount have been much more the consequences of the restrictions on banking than of an augmentation in the demand for capital.

By the last week's returns the private securities in the Bank amounted to 19.9 millions, against 18.6 at this time last year. Then the rate of discount was only 2½ per cent.; last week it was 4½, now it is 6. Last week the reserve of notes and coin was 9.5 millions; now it is only 7.1. Then the bullion was 16.8, now it is 13.8. Thus the demand of the public for capital, so far as the Bank is concerned, has increased since this time last year only 6 per cent., while the Bank reserve of legal tender notes has decreased nearly 24 per cent., and the bullion has decreased about 18 per cent. The discrepancy between the increased demand of commerce for capital, 6 per cent., and the decrease of the Bank's resources, shows very clearly that it is not the action of commerce which lessens the Bank reserve and induces it to raise on commerce the rate at which it will lend its credit notes.

All economists agree that what commerce is always borrowing is capital, and that it is the relative demand for capital in relation to the supply which really determines in the free market the rate of interest or discount. The Bank really lends capital or its representative credit-notes, for which capital can always be had. For many months the character of our trade, notwithstanding the increase of our exports, has been dull. There has been no increase of enterprise in the country increasing the demand for capital. The yield of the land has been indeed small. There will be a smaller saving of capital in the agricultural districts than usual; but in consequence there will be less agricultural enterprise, and, at the same time, the accumulation of capital in the manufacturing districts has at least been as great as usual. There is neither an increase in enterprises, nor a diminution in the supply of capital in the country to justify the increased rate of discount demanded by the Bank.

There is, however, a decrease of gold in the Bank, and a decrease in the amount of credit notes it is allowed to issue. Ever since it became certain that the harvest would be defective there has been a demand for gold to send abroad. Since the beginning of September the bullion at the bank has decreased something more than £2,000,000. What a paltry diminution of one commodity universally in use is this to affect the commerce and increase the interest of capital of this mighty trading country. It is scarcely an appreciable percentage on even its floating capital, and it is clearly absurd to suppose such a paltry increase in the demand for capital could have any effect on the rate of interest were the supply entirely free.

Moreover, it is probable that the demand for capital to send abroad to purchase corn was quite as great six weeks ago as now, but the reserve of the Bank and the bullion in the Bank did not then decline in a similar manner. Between September 5 and September 26, and long after the demand for foreign corn began, both the bullion and the reserve increased; and there was then accordingly an expectation, that the rate of discount would not be raised; but subsequently to September 26, as the salaries of the government officials, and as the dividends were paid, and as gold was purchased here for the rival bank abroad, the reserve rapidly declined from 9.9 millions to 7.2, and then it became apparent that the bank would raise the rate. This was, however, brought about by the consequences of our money regulations, and not by the action of commerce.

This is made perfectly clear by the second and hasty rise in the bank rate on Wednesday. It was caused by some person taking, on Tuesday, from the Bank £300,000 on account of the Bank of France; £300,000 was also withdrawn on Wednesday, and it is asserted more will be immediately taken, making the total amount taken for the Bank of France £1,000,000. In France there are symptoms of increased commercial activity. The Bank of France has made large advances to commerce; and being obliged by law to restrict its issues by its bullion, it buys this in our market. Both banks make a large portion of their profit from the issue of paper, and both are now fiercely contending, to the great injury of trade, for the gold on which they issue their legal paper.

We have thus, we hope, made it tolerably clear, that the rise in the rate of discount is much more the consequence of restrictions and regulations, than of the free action of commerce, and further we do not now propose to carry the argument. We may infer, indeed, that what is objectionable and true of the Bank of England, is true of the Bank of France. That commerce is inconvenienced by the rise in the rate, and by the restrictions on credit and banking, is evident, but such a trifle will not disturb the Government. As a rule, it is only moved by famine, insurrection, commercial convulsion, or revolution, to consider its own acts, and then it does in a hurry, what it ought to do calmly and quietly, that it may be done justly and effectively.

PUBLICANS AND SINNERS.

IT is with callings as with individuals; a reputation once acquired, elings for good or evil long after the occasion for it has ceased. If the proverb about hugging dogs of ill name had been rigidly

applied, many a dog reclaimable and reclaimed, would have been needlessly sacrificed. And it is with men as with dogs. How many lawyers would be now living if the deserts of lawyers, as popularly expounded, had been meted out to them! How many publicans! As for the latter, it is high time that the classification of publicans with sinners should end. That sort of coupling was right and proper enough eighteen hundred and some odd years ago; but it is now obsolete. Publicans had not a daily organ in those days, pregnant with religious fervour. British publicans—that is to say virtuous licensed victuallers—are only sinners in the sense that all of us are sinners—no other. People of this class have given so many proofs of their addition to virtue under circumstances of difficulty, that it would be eminently unjust to continue to bracket them with sinners for the sake of holding to a formula and a tradition. We venture to say that nobody knew what amount of virtue lurked among licensed victuallers, until the French commercial treaty and new tariff stirred it up and brought it to light. Were it not that these companions of sinners (by tradition and discount) had perceived the immorality that must accrue from the granting of wine licences to pastry-cooks, no one knows how long the public might have remained in the dark about it. The fact is, that the ability to form opinions on special subjects is the exclusive privilege of a special education. Their publicans alone knew what germs of delinquency lay dormant in a claret bottle; and, knowing this, they wisely and most virtuously opposed the sale of this pernicious beverage by people so ignorant, so devoid of moral feeling—in a word so untrustworthy as pastry-cooks.

We could fortify our vindication of publican virtue by many arguments, all tending to the same end. What we have stated, however, will suffice to show the high opinion we entertain of licensed victuallers' virtue as it is, and to manifest our faith in the probability of its still higher development in future. We feel assured that if any shortcoming on the part of publicans be only pointed out, men strenuous and immediate will be adopted to remedy the same. Well, then, it seems to us that publicans are instrumental—passively and unconsciously—in raising the expenses of candidates for parliamentary honours to a pitch altogether beyond the means of many a good man to bear, though he be—in all other respects than that of not having a long purse—fully eligible. It was one of the articles of belief with those who brought about the passing of the Reform Bill, that large constituencies would, by reason of their very largeness, be placed beyond the pale of bribery.

There may be some truth in this way of viewing the case. Doubtless there is something very congenial to the exercise of direct bribery in the nature of a small borough, and we could point to more than one large borough for a demonstration of the belief that the necessary expenses of electioneering may be borne without inconvenience by a not over-rich candidate. Thus, beyond the mere expenses of travelling and personal hotel bills, it does not, we are informed, cost Mr. Bright one farthing to make good his return for Birmingham. The electors of Glasgow are not less considerate. There is nothing in the intrinsic nature of electioneering that should exact on the part of a candidate those heavy disbursements ordinarily consequent on an electoral appeal. It cost Lord Elington not much less than £5,000 to win Marylebone; it cost Mr. Jacob Bell little short of £3,000 to lose it. Of bribery there was no imputation, as bribery is commonly understood, yet without considerable sums disbursed to make things pleasant, sums expended improperly, morally speaking, there is no way of accounting for the outlay. Turning to the borough of Southwark as more prominently this time under notice, the late Sir Charles Napier was considered to have secured his return cheaply at a cost of £1,500; and as for the representation of Southwark now pending, some local notabilities have caused it to be understood that no candidate, whatever his political views, will be deemed acceptable if not prepared to spend at least three times that amount.

Now this is a condition of things to be protested against; and we would implore the publicans as highly conscientious men, having peculiar relationships with borough constituencies to see to it. Thrown by force of circumstances very much amongst the ten-pound householders, the publicans exercise upon the latter a strong moral influence. We implore the publicans, then, in the interest of that public morality which they hold so dear, and in the cause of which they have made so many sacrifices, to abate, as much as in their lies, the evil of which we speak. Sure we are they cannot be actuated by any paltry desire of money-making out of thirty committee-men! Not a bit of it. Men who can do public morality being the incentive, what Mr. Ayrton advised his publican friends to do, and which we are told they have done—water their gin, in furtherance of the temperance movement,—taught not, after such a sacrifice, to lie under the imputation of abetting sin, of keeping company with sinners. How the imputation could have lasted so long puzzles us to understand; and no seasons better than electioneering seasons display the charity—the utter abnegation of self so prominent a virtue amongst publicans. How many a poor fellow on these joyous occasions finds to-day a wet sponge passed over his little tick chalked over the mantelpiece but yesterday! It is not to be

assumed that the member makes good the loss. Not at all. Bonifacio has cleared off those records of leers and tobacco out of pure benevolence, moved thereby by the joyous occasion. These and other acts of pure benevolence endear Bonifacio to the "free and independent." Publicans, for good or for evil, have enormous powers. The collateral expenses of electioneering—very different from bribery—are of such a peculiar nature that they pass outside comprehension. We fancy publicans know more about them than other people; and we feel confident that men who have given so many proofs of virtuous bearing, will do all that in them lies to make a seat in Parliament more compatible with the means of moderately rich men who desire to serve their country without being ruined by their ambition.

TITLES AND TRUST.

VASEBURN'S Lord Foppington speaks of the "impossible pleasure of being a man of quality." That noble peer is of a date anterior to the development of journalism; or we could have believed that by his "impossible pleasure," he meant the high relief, and intense inward enjoyment with which the aristocracy generally must read the newspapers! These records of life are not without zest and interest to ordinary men. But to the peerage they must have a sorrow, that no mental effort on the part of "yout even 'Christian," can extract from them. They abound in precisely the kind of flattery that is the most delicate, because it is offered unconsciously. The homage paid to rank must often be a noble or right honourable eye everywhere; the form it takes is often ludicrous, not seldom disgusting to those who pay it; but it is not the less a homage for that.

Some proceedings in the Insolvent Court, in the papers of the 12th instant, illustrate in a striking manner what a potent charm a title is in the eyes of a British tradesman. It instantly deprives him of caution, lulls his suspicion, and extracts from him money's worth, without even a hint of references, or cash on delivery. He is wide awake to ordinary customers, who have means to pay and no wish to cheat; to them, if unknown, he is rigorous. Let one come who asserts some far-off connection with duke or earl, the sharp trader falls prostrate, and a moral slumber possesses him. He is an old babe renewed. The eyes of Argus the watchful, closed to the piping of Mercury, the rogne?

Could anything but the glamour and magic of a dual title have done this? A gentleman who, up to 1856, had held a situation in the customs, with a salary of £140 per annum; in June of that year, "having been promised a paymastership in the army," resigned his first appointment. He was much too sanguine in so doing, for "he was disappointed, and did not get the second." He afterwards "had no occupation, but received gifts from friends." A gentleman who had lost one situation, and not got the other, and was living in two furnished rooms in Piccadilly, was not, it might be thought, likely to obtain large credit of a wine-merchant. But there is an "open house" to the London tradesman—day-book and cellar. "Going to the Duke of Devonshire" was the charm; and between the end of December, 1857, and July, 1858—in seven months—there passed through the front door of the furnished lodgings in Piccadilly, "wine and spirits to the value of £37, 9s., and those wines and liquors the insolvent drank," with the assistance of friends. The consumption was assisted by £30 worth of cigars from another quarter; but whether they were obtained by the same spell that worked on the wine-merchant is not stated.

In neither case did it appear that any inquiries were made or reference asked. The mere assertion of a slight connection with a duke was accepted as sufficient security. Supposing the Duke of Devonshire to be really the insolvent's godfather: do godfathers generally, or dual godfathers in particular, always pay the debts of their godsons? Only the other day, the son of a duke had to prove publicly that his father would give him nothing. Mere relationship to, or connection with a peer, is a very slender basis on which to run up a wine-bill of more than £300. It is no security to trust to, without inquiry, even if the assertion of such a connection is true. There are thousands of tradesmen in London who, if asked to supply an unknown Jones or Brown, would keep a tight hold on the pair of boots or the dozen of sherry till the cash was handed over the door-mat, yet would pour into the "furnished lodgings" of a *slight* connection of a peer half the stock in their shops without asking a question.

This is one form of homage to the aristocracy that is peculiarly British, and exceedingly stupid. A Parisian tradesman would no more trust a self-described *Vicomte*, than any other "person unknown." Indefinite Gräfs and Barons find no implicit belief from their countrymen. It is only in England that all the faculties of a man of business are suspended at the sound of a title. If the aristocracy meet some sturdy abuse in the political columns of our journals, in the small type reflex of our social life they are avenged—they constantly see their more names predominating over and ruling the commercial instinct. And so long as that social influence lasts, they may defy all political denunciations—even those of Manchester.

A SHAKESPEARIAN ESTIMATE.—Such was the enthusiasm of the Rev. Dr. Parker (author of the book "On the Learning of Shakespeare"), not only for Shakespeare, but for the stage, that it is said he refused a bishopric, because a bishop could not go to see "Macbeth" or "Richard the Third," as the play-houses. In his time Garrick was acting.

RURAL ECONOMICS.

OBSTACLES TO LAND IMPROVEMENT.

Is a recent paper we observed on the apparent insusceptibility of some of the owners of landed property in England, who could see and understand the advantages the Scotch agriculturists derive from leases, yet persist in their minority system of yearly tenancies, with all its attendant depressing stagnation; and we said, "It is no ignorance! What is it?" To this the corresponding signing himself "A Retired Solicitor," sends us an answer, from which we take the following passages:—"My ready answer is, that the laws of entail and strict settlements, involving all manner of incumbrances, put it out of the power of the great body of landlords to grant leases. Such is the naked and plain fact, and I trust to them all for their land-owning and land-improving agents; and yet there is a sort of *riddle-maze* floating like a foggy cloud around, and enveloping the subject." Again he says: "A tenant for life in possession is tied and bound by the claims of his inheritance: as his father held the possessions, so he holds them; and as he holds them, they must pass to his son and heir." . . . "My wonder is, that men in the political position of legislators should submit, one generation after another, to such a thralldom. . . . What boots it for noblemen to specify at agricultural dinners and meetings, advising the farmers to 'put their shoulders to the wheel,' when the landlords put the drag on, and so prevent the onward movement? . . . And he adds: "The country has a perfect right to petition the Legislature and even to insist that wholesome alterations should be made in the law of entail; but chiefly with the object of giving some general powers to tenants for life to grant leases for reasonable terms of years, and at adequate rentals, without any power in the next heir or reversioner to invalidate or ignore such leases."

There is much truth in the remarks we have quoted, but they comprise only part of the truth, and do not fully account for the anomalous condition of landed property in England. It is by no means the absence of power to grant binding leases, which prevents English landlords from letting their land on leases. Most settlements of land confer a power to let the tenants for life, when in possession, to let leases of agricultural land for twenty-one years at rack, *i.e.* ordinary rents; and, although such powers are sometimes confined and limited unwisely, as to the stipulations required to be inserted in the leases, there is no doubt that under most modern settlements very effectual and satisfactory leases might be granted if the proprietors were sufficiently impressed with the advantages of giving security of possession to their tenants. But more than this, an Act of Parliament was passed in 1856 (19th and 20th Vic., c. 120), "to facilitate leases and sales of settled estates." Under that Act the Court of Chancery may, on petition in a summary way, authorize the grant of leases, subject to certain conditions specified in the act, and may direct by whom they shall be granted. Those conditions so far as they relate to agricultural property, are,—first, that the lease shall take effect in possession at, or within one year next after, the making thereof, and shall not exceed twenty-one years; secondly, the best rent, or reservation in the nature of rent, that can reasonably be obtained, in possession for a term of years, and said rent is to be made payable half-yearly, or oftener; thirdly, no lease shall authorize the felling of any trees, except so far as shall be necessary for the purpose of clearing the ground for any buildings or works authorized by the lease; and, fourthly, every lease must be granted by deed, the lessee must execute a counterpart, and must contain a condition that the lease shall not continue in force for not less than twenty-eight days after it becomes due. Subject to these conditions and such covenants and stipulations as the court shall deem expedient, with reference to the special circumstances of the demise, the court may either exercise the power to authorize leases by approving of particular leases, or by ordering the powers of leasing shall be vested in trustees, which they may exercise as if the statutory powers had been given by the settlement. By the same Act the court may authorize sales of timber (not being ornamental timber) growing on the whole or any part of a settled estate.

The application for authority must be made with the consent of the first tenant in tail (if of full age), and all persons in existence having beneficial interests in the estate under the settlement prior to such tenant in tail, and all trustees having interests on behalf of any unborn child prior to the estate of the first tenant in tail. In other cases, all persons beneficially interested, and the trustees for unborn children, must consent to the application. Notice of the intended application must be served on all trustees under the settlement, and advertised in such newspapers as the court may direct. These provisions refer to cases where the actual possessor of the lease is an infant, or otherwise incapacitated to act. But by the 32nd and 33rd sections of the act, the power is extended to persons entitled to a life interest, or a determinable with his own life, or for any greater estate, either in his own right or in right of his wife, unless expressly forbidden by the settlement so to do, may, without any application to the Court of Chancery, grant leases for twenty-one years of any part of a settled estate, except the principal mansion-house and the demesne thereof, subject only to an obligation to reserve a rack rent, without a fee, inserting in the lease usual and proper covenants, and requiring a counterpart. The leases so granted will be valid against the grantor of the lease and all persons subsequently entitled to the property under the settlement. Under this act the husband of a woman entitled to a fee simple estate can grant a lease binding against his wife and her heirs. This power of leasing may be exercised by tenants for life, notwithstanding the estate is subject to incumbrances. The Act was extended and amended by another Act passed in 1858, but on points of detail on which it is not necessary to enter.

Besides the above Acts, there are several modern Acts of Parliament which authorize the owners in possession of settled estates to expend money in draining and otherwise improving such estates, and to retain a charge on the property for the amount so expended; or they may charge the settled estates with money borrowed for the purpose. Moreover, there are several land-improvement and land-draining companies, which are authorized, under special statutes, to advance money for improving settled or other estates, which money is charged on the estates, and is paid off, with interest, by instalments, extending over periods of from twenty to thirty years, as may be agreed on. Now, here we find that the Legislature has given ample powers for most, if not all the purposes of agricultural improvements, and for granting

binding leases to persons in possession of settled estates; and yet leases of farms, such as are universal in Scotland, are seldom granted in England. Settlements and entails do not now directly prevent farm leases, though doubtless they do so indirectly, by rendering most of the owners of settled estates, to a great extent, mere nominal owners. Precisely, the majority of landowners have not the available means of making great improvements, but they may always obtain money for the purpose through the improverment companies, or they may grant leases to tenants of capital upon terms that will induce such tenants to execute the required permanent improvements. It is undeniable, therefore, that it is either the want of business habits, the absence of good advice, or an adherence to prejudices and past usages, which mainly prevents the English landowners from rendering their estates as profitable to themselves, their tenants, and the community, as, under good management, they ought to be.

ORGANIZATION OF THE FRENCH ARMY. — No. II.

EDUCATION.

It is a former article we gave an account of the manner in which the French army is enrolled, equipped, and disciplined—to describe its intellectual training will be the object of this. Under the French military system the cultivation of the recruit's mind is not neglected; and moreover, ignorant he may have been on entering the service, he has abundant opportunities afforded him, while in the ranks, of acquiring sufficient literary knowledge to render him capable of himself efficiently discharging the duties attached to the higher grades of his profession.

While the development of the French soldier's personal powers is carefully attended to, the course of instruction which he undergoes is so varied by a judicious arrangement of his exercises as to prevent its becoming monotonous. So soon as the recruit is dismissed from drill, and considered qualified to perform military duty, he immediately enters the regimental schools, the attendance being compulsory in each. The regiment has two schools, one of the first and the other of the second degree. The primary, or school of the first degree, is frequented by private soldiers and corporals; the superior, or school of the second degree, by all *sous-officiers* (non-commissioned officers) and privates whose education is sufficiently advanced to enable them to profit by the instruction given there. The recruits are examined, from attendance who are fatal, on strict examination, to have previously received an education of a higher class than that provided for them in the regimental establishment. Non-commissioned officers employed in the "bureaux" of the regiment may also claim exemption. Men undergoing punishment are excluded, as a mark of disgrace, and those found incapable of learning are discharged after a three-month's trial. The director of the schools is always an officer; in the cavalry, a second captain; in the infantry, he may be either a lieutenant or sous lieutenant; he is appointed by the colonel, generally on the recommendation of the major, who is charged with the *comptabilité*, or internal arrangements of the regiment. Besides being a man of acquirements and ability, he must possess an aptitude for instruction, and be animated by a desire to communicate it; he is assisted by monitors of his own selection, of whom the chief, or head monitor, is always a non-commissioned officer. The director and his subordinates may be retained in their respective offices as long as the colonel considers them competent, and finds them to be so; and, during that period their performance of duty is rewarded by the *capitaine* (children of the regiment, of whom more hereafter) have the special privilege of becoming monitors at fourteen years of age. All soldiers not on service must have the colonel's written permission to absent themselves from lessons, or duty for a single day; without it, non-attendance is punished as a neglect of duty.

The course of study commences on the 1st of October every year, and ends on the following 1st of July, leaving an annual vacation of three months. The primary, or school of first degree, is held on every day except Saturdays and Sundays; the superior, or second degree school, is only open twice a week. The students of each are collected and marched to the rooms by a non-commissioned officer; and disobedience of command, or disorder in the ranks while proceeding there, are treated as military offences. The monitors arrive before the pupils, so as to receive pens, ink, and paper, from the head monitor, and have everything ready for the immediate commencement of lessons.

The primary school is divided into four classes: viz., the preparatory class, composed of such men as are reported by the captains of their respective companies to be unable to read or write—of the first and second classes—selected according to their degree of advancement; and of the *classe élève* (superior)—men admitted to the preparatory class, who are furnished, along with knowing how to read and write, must be well acquainted with the four first rules of arithmetic, and capable of writing correctly from dictation. The three first classes meet in the same room, the last in another apartment, or in the same one, but at a different hour; two hours are spent each day in study, and the instruction comprises reading, writing, English, French, and figures.

The course for the first year in the superior school includes French grammar, arithmetic, geometry, and military administration. That for the second year—geography, history, fortification, and the study of maps. In this school, also, the pupils are divided into four classes, the last of which, the first half-hour is devoted to questions on the previous lesson. The second half-hour is spent in explanation of the lesson of the day; and the last hour is employed in writing exercises upon it, and in correcting them. The officer-director has charge of all the material of the schools; he superintends the lessons given, and presides over the examination of the pupils on the respective subjects which form the course of study in the superior one. On every Saturday he assembles all the monitors of the primary school, and explains, during two hours, the nature and tendency of the instruction which they are required to communicate to their pupils, pointing out, as he proceeds, the most simple and effective method of conveying it; he promotes the emulation of the pupils, and reports to the colonel every three months on the state of each class, sending at the same time a return of the students who have distinguished themselves by good conduct, attention, and proficiency; their names subsequently figure in the regimental order of the day, and this honour, as a matter of course, secures their advancement. The best monitors receive a gratuity of 40 centimes (4d.), and those of the lower class 10 cen-

times, or 1d. per lesson; in addition to which money-rewards, drawn from a fund specially provided for that purpose, are given them, according to merit, by the inspecting general, who is also empowered to grant prizes to the most deserving of the scholars. When the regiment is divided, schools are opened in the different detachments, which are conducted by monitors; or the scholars are sent to the nearest military academy, or to a boarding-school.

The superior surveillance of the regimental schools is vested in the general commanding the brigade to which they belong. He makes quarterly inspections, during which the written exercises and compositions of the pupils are submitted to him; he takes care that none but the authorized books are used, and he, in turn, makes reports to the Minister of War, or, since the new arrangement, to the minister of the corps to which he is attached, stating the results obtained in each regiment, and suggesting any alterations or improvements in the system which, in his opinion, it would be desirable to adopt. These periodical inspections are often made unexpectedly, and thus the state of the different schools is ascertained when the instructors are quite unprepared for the control. We recollect once meeting a bandmaster in the state of great excitement, and on inquiring the cause "Ah, monsieur!" he exclaimed, "a most unfortunate occurrence has just taken place; the general, on quitting the train, went straight to the barracks, and entered the dancing-school; not having been expected, no requisition was made to me for music, and as he would admit of no delay, the dancing-master was obliged to whistle for his pupils."

From this sketch of the system of education pursued in the French service, its superiority to that adopted in our army is clearly perceptible. Attendance to receive instruction is compulsory; science is discovered, and talents are developed. Knowledge is communicated to the soldier in a simple, direct, and—forced upon those who are too indolent or too idle spontaneously to seek its acquisition. The soldier in his humblest grade commences preparation for his advent to the highest dignities of his profession. And should he, after from inability to succeed, or indolence to continue a military education, be sent on the terms of a pensioner to a boarding-school, he is a village better instructed than when he left it, and carries into his domestic circle not only the information of a travelled and comparatively well-educated man, but, in addition, a professional knowledge which renders him a source of future strength to his country, should it be provoked to war, or menaced with invasion. It is in such French regiments an institution which not only secures an early asylum for the children of poor officers and meritorious soldiers, but afterwards qualifies them, by the gift of a superior education, to advance in the profession of their fathers, should they be disposed to accept it; or, if not, fit them for any other calling which may better suit their inclination. The *"Ecole de troupe"* thus excites our sympathy; for what can be more touching than to see those valiant warriors, the pride and care of every soldier in the ranks—marching before the eagles under which their fathers fought and perished? What an endearing epithet is the "Child of the regiment," and what a proud and independent one too. Though in reality supported by the bounty of the state, the boy who bears it is supported by the children of the regiment, and to the children of the regiment. Assuredly the French exercise more delicacy and judgment in the designations of their public institutions, and in the manner in which they treat the objects of their benevolence, than we do. They do not parade the inmates of their hospitals in outlandish dresses, to have their always stared at the relation of public relief, neither do they, by adopting the degrading epithet of "ragged" to designate the schools provided for its instruction. Their object is to support the spirit and sustain the self-respect of those whom misfortune compels to resort to public aid, by giving a name to the schools which not only respects the institutions, but anything, to avoid themselves of which the poor are entitled as a matter of right to which they may have recourse without feeling the blush of shame on their face when they name their home of refuge, or their place of education.

There are twenty-five *enfants de troupe* attached to every infantry regiment (one for each company); in the cavalry there is one for each troop; so that, including the guard, the line, engineers, artillery, cavalry, assaues, spahis, foreign legion, and gendarmes, between six and seven thousand children are supported by the state, in a healthy and inexpensive manner. One-third of the places are reserved for the children of officers, to the rank of captain inclusive. The remaining two-thirds are allotted to the sons of non-commissioned officers and soldiers. The latter are "presented" by the colonel of the regiment, and appointed by the general commanding the division. The former are recommended by the colonel, approved of by the general, and admitted after obtaining the sanction of the Minister of War. The children may be nominated at two years old, and in that case are allowed to remain with their fathers until they attain the age of ten, during that time they receive their daily ration of one-and-a-half pound of bread, and their daily pay of 40 centimes (4d.); at ten years of age they must join their regiment, when they are equipped and clothed in uniform. It is not necessary that they should be the children of men who belonged to the particular corps to which they are attached, but their fathers must have served in some capacity, and be able to produce certificates of good conduct. During their tender years these children are daily sent to the municipal schools, where they are taught and receive religious instruction; after their first communion they enter the regimental schools; and when qualified to do so, attend lectures at the college (should there be such) of the garrison town, or at the barracks, where they are stationed. At fourteen years of age they are entitled to the full pay of a soldier, and they may then become monitors in the regimental schools. At seventeen they can engage, and as they are habituated to a military life, they generally do so, when, if they have conduct and merit, they rise rapidly, as they usually acquire the profession of the colonel, who has known and appreciated them from their infancy. Should they decline to enter they are discharged at eighteen, and at twenty draw lots for the conscription. The *enfants de troupe* are placed under the immediate charge of the directing officer of the schools; he receives their pay, which they are not allowed to touch till they enter the ranks with it, and the proceeds of the bread ration, which the boys are unable to consume, he presents them occasional treats and recreations, and he always keeps a surplus in hand to secure carriage and creature comforts for his little *protégés* when the regiment changes quarters, the marches being in general far too long for their strength.

From amongst these *enfants de troupe* have risen some of the brightest ornaments of the French army.

CRYSTAL PALACE.—ARRANGEMENTS FOR WEEK ENDING SATURDAY, NOVEMBER 18th.
MONDAY, Open at Nine. TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, Open at Ten. Admission, One Shilling. Children under Twelve, Sixpence.
SATURDAY, FOURTH WINTER CONCERT. Admission, Half a Crown; Children, One Shilling. Reserved Seats, Half a Crown each.
 Orchestral Band and Great Organ Performances daily.
 Boxes Tickets, Admitting until 5th April, 1861, 10s. 6d. each.
SUNDAY, Open, at 12.30 to Shareholders gratuitously, by tickets.

THE RELIEF OF LUCKNOW.—The Triumphant Meeting of Havelock, Outram, and Colin Campbell, surrounded by their Brave Companions. This grand Picture, by T. J. Baines, Esq., is still Open from 11 to 6 o'clock. Admission, Free, by Private Address Card. N.B. In dark weather, and after 7 o'clock, the Picture is brilliantly illuminated by artificial light.
MAYNARD & LEGGATT, 78, COVENTRY.

PAPER AND ENVELOPES.

THE LONDON REVIEW

AND
WEEKLY JOURNAL.

SATURDAY, NOVEMBER 17, 1860.

Is the *London Gazette* of Tuesday last despatches were published explaining satisfactorily the reasons which compelled Lord Elgin to break off negotiations with the Chinese commissioners. A draft of a convention had been drawn up, to no clause of which had any serious objection been made, excepting to that by which it was provided, that of the £2,300,000 sterling declared to be due by China to Great Britain, one-eighth should be paid before the evacuation of Tien-tsin by the British troops. It was arranged that this document should be signed on the 8th Sept.; but on the 5th the Chinese commissioners alleged that they had not full powers. As this assertion could only be attributed to a design to create delay, which might throw the expedition into the winter, Lord Elgin, with the concurrence of Baron Gros, intimated to them, that in consequence of their bad faith in assuming the title of plenipotentiaries, he had determined to proceed at once to Tientsin. On the day before this resolution was formed, the second division of the English army reached Tien-tsin, so that our forces were in the best possible condition for a movement in advance. On the 8th the army left Tien-tsin, and on the 11th it reached a place called Yang-tsun, forty-five miles from Peking. Another battle may have been fought by this time, although the impression seems to have been in the English camp that the Tartars have been too much frightened by our artillery at Taku to venture on any further resistance.

In a former number we referred to the position of the Chinese rebel army in the neighbourhood of Shanghai. Despatches have now been received giving the official account of an attack made upon the city on the 18th of August last. The rebels, it appears, approached the walls about two o'clock on the afternoon of that day, and advanced under cover until they were near enough to be fired into with canister and smooth-bore muskets. In about two hours they retired. They have since withdrawn to a considerable distance from the city.

The present rebel leader, it appears, was for four years a missionary preacher at Hong-Kong. He is said to advocate the introduction into China of newspapers and railways, and to be sincerely anxious to raise his countrymen to the level of the European nations. A reply sent to a notification from the European commanders at Shanghai is a remarkable document, showing, as it does, that the rebels consider themselves a national party, entitled to our sympathies, on the ground of a common faith, a common desire to promote commerce, and a common cause against the Imperialists.

The news from Italy is of less importance than it has been for some time

past. We have now a detailed account of the entry of Victor Emmanuel, on the 7th current, into Naples. The day was cold and gloomy, thunder rolled fiercely, the rain fell in torrents, and a "sirocco wind" scattered the flowers, and washed the marbled paper and stucco ornaments from the half-finished triumphal arches. The King drove into the city in a carriage with Garibaldi at his side, and was cheered enthusiastically, although the crowd assembled to greet him stood under umbrellas all the deluge. With the Dictator he proceeded to the Cathedral, where, after visiting the relics of Saint Januarius, he heard a *Te Deum* solemnly celebrated. As Garibaldi passed down the stairs, a dense crowd surrounded him, and leaped at him to embrace him. Some of his friends tried to keep the people back, but in vain; they kissed him, and hugged him, says the *Times* correspondent, "like one of their own saints" and shouts of "Viva Garibaldi!" intermingled with, "Emanuele!" and shouts of "Viva Vittorio Emanuele!" On the forenoon of the following day, Garibaldi, accompanied by the ministry, formally presented to the King the result of the *plebiscite*; an act of annexation of the two Sicilies to Sardinia was drawn up; and the dictatorship having ceased, the provisional government tendered their resignation. On the 9th, Garibaldi took leave of his friends, and set out for the island of Capri, after receiving from the King, the staff, the officers, and the army in general, the most striking demonstrations of sympathy and affection.

Garibaldi's appointment as a general in the regular army has appeared in the *Turin Gazette*, it being understood that when the army of the new Italian Kingdom is organised, he will take a rank in it corresponding with that of Marshal of France. Before leaving Naples, he issued a farewell proclamation, in which he requests his companions in arms to be ready to follow him again in March, 1861, as it is then likely, he adds, prophetically, that there will be a fresh conflict in Italy of such a magnitude that a million of armed men will be required to sustain it. King Victor Emmanuel was to have left on the 11th for Sicily; but his departure in the mean time has been adjourned. He has appointed Farini his Lieutenant-General at Naples, and has named a Lieutenant-Council, in which Viminiglia, Pisanello, Scialoja, and Poerio are respectively ministers of the Interior, Justice, Finance, and Public Instruction.

The official result of the voting in the Papal States has been published. There were in the Marches 137,753 voters for, and 1,212 against annexation; while in Umbria the corresponding numbers were 97,040 and 250. At Ancona and Perugia the publication of these figures was celebrated by public rejoicings.

Letters from Gaeta, dated Sunday last, state that Francis II. had refused to evacuate the town. A telegram from Naples, dated Wednesday last, adds that the garrison was reduced to 3,000 men; that one regiment and two companies of Bourbon troops had been made prisoners by the Sardinians; and that the Royalists still encamped outside the fortress had proposed to surrender. Spanish and Portuguese frigates had arrived on a mission, a Prussian general having also made his appearance at the court of the ex-King.

The *Gazzetta di Roma* states, that no less than 20,000 men of the Neapolitan army, recently entered the Pontifical territory, in order that they might remain faithful to the king, Francis II. The Pope directed that they should be supplied with food and lodgings.

According to a despatch from Naples to Turin, promulgated in the latter city on the 8th, Francis II. has been advised by the admirals of the foreign fleets to leave Gaeta, a statement likely to be true, as an understanding is said to have been come to between France and Russia.

The Russian ministers at foreign courts have received a circular from St. Petersburg, which repudiates the ideas attributed to the Russian Government, of wishing to uphold the principle of legitimacy at all hazards, and without regard to the requirements of the age. The document suggests the expediency of assembling a congress, to establish a new basis of public and international law.

The *Press* of Wednesday last, announces that the Empress of the French left Paris on the morning of that day for Scotland. The Duchess of Hamilton, being a Princess of Baden, and a cousin of Louis Napoleon, and of the Empress herself, on the mother's side, the world may so far account for this somewhat eccentric excursion.

The King of Siam has declared war against the Emperor of Annam, who is now at war with France and Spain.

Discontent still prevails in Hungary. It is asserted that out of its 15,000,000 of inhabitants 14,000,000 are dissatisfied with the patent, and claim a total restitution of national rights as the only condition of reconciliation with the Hapsburgs. In the mean time, however, twenty-five of the Palatine or municipal bodies named by the Emperor, have agreed to act under the privileges conferred upon them in the new charter. A Prussian paper states that attempts have been made secretly to introduce arms and ammunition to the American ports of the Adriatic, and thence to transport them by agents into Hungary and Poland. English vessels coming from Hull and Newcastle are said to be engaged in this contraband trade.

The intelligence from New Zealand is of a gloomy character. The insurgents, however, have ceased to commit murders; active military operations having been commenced on the 10th of September last. Still no decisive victory has yet been gained over them, and they are conducting their defensive operations very warily. Strange to say, although armed only with fowling-pieces, and flint and steel muskets, and obliged to use bolts of iron-wood for ammunition, they are able to keep the English troops

at bay, but ill-timed scruples are partly the cause of British want of success. Fortunately the malcontents have not been joined by the native tribes in other parts of the island, who remain peaceable and friendly.

The Lord Mayor's day was kept this year with more than usual pomp—the Rifle Volunteers having added a new feature to the customary pageant. At the banquet, which took place in the evening, the Count de Persigny, referring to the still existing mistrust between England and France, remarked that he could see no reason for even anticipating any real hostility between the two nations. The inhabitants of both countries, in his opinion, are every day becoming more and more convinced that everything may be lost, while there is nothing to be gained, by fresh struggles; and the economical revolution accomplished in France by the Emperor is destined more firmly to establish peace, when its vast bearing is generally understood in England. Lord Palmerston spoke hopefully of the present state of affairs. He expressed his gratification at not having this year to dispel any gloomy forebodings. He trusted that the example lately set by the Emperor of the French, of giving full effect to different forms of trade, would be followed by other governments of the continent not yet so far advanced in enlightenment.

At the dinner of the London Salters' Company, which took place on Wednesday night, Lord John Russell vindicated the policy adopted by this country in Italy, and urged the importance of our not judging too hastily the course taken by Lord Elgin in China. Lord Palmerston, in his speech on the same occasion, referred to the gratifying fact that the Americans had not received the Prince of Wales as if he were a stranger belonging to another land, but as if he had been a citizen of their own republic.

The Commercial Treaty seems to meet with great favour from the Chambers of Commerce in various parts of the country. It does not, however, receive universal approbation, even among liberal politicians. Mr. Edward Ellice has addressed to his constituents in Coventry a letter in reply to a communication from the Mayor, in which he disapproves very strongly of the financial policy of the last Session. Referring to the treaty, an arrangement, in his opinion, incompatible with the principles on which our commercial legislation has hitherto proceeded, he animadverts upon its utter neglect of equivalents and precautions, which there was not the slightest reason to believe might not have been obtained and provided. In saying so, he refers more especially to the silk trade.

A meeting of the Manchester Chamber of Commerce was held on Wednesday morning, to confer with Mr. Morley of London on the prospects of Bankruptcy Law Reform, at which a resolution was passed, expressing the satisfaction with which those present had learned that the Government were to introduce a bill on the subject early next session.

Mr. Bright has returned to the subject of Parliamentary reform. He has just addressed a long letter to a spinner in Blackburn, in which he deplores the prevalent ignorance of political economy, and endeavours to show that strikes and the antagonism of labour and capital originate in the exclusion of the working classes from the franchise.

While Mr. Bright has sought to explain the spirit of discontent among our working classes, Mr. Sharman Crawford has been trying to prove that his countrymen have never cherished feelings of hostility to England. He has done so in a letter on the Volunteer movement, addressed to the secretary of a committee appointed for the purpose of raising a rifle corps in Ireland. He thinks that the decision of the House of Commons on Colonel French's motion was a stigma on his country, most unjustly inflicted; the history of the Volunteer movement during the last eighty-two years furnishing no reason why Irishmen should be denied a privilege conferred on Scotchmen and Englishmen.

A disgraceful Orange riot occurred at Belfast, on Tuesday last, at a religious meeting. The Bishop of the diocese, who was present, was compelled to retire, in consequence of the abusive language used against him;—the offence he had given being that he had inhibited a clergyman from preaching on an Orange anniversary.

Mr. Train has been fortunate in Lambeth than in Marylebone. The committee appointed to visit Birkenhead and to consider his scheme for forming a street railway between Westminster-bridge and Kennington-gate, have given in a report strongly urging its adoption. On Wednesday evening there was a meeting of the representative council, at which Mr. Train stated that the opposition to his system at Birkenhead was exclusively directed against the running of the cars on Sundays.

The *Ethiopia*, West-African mail steamer, arrived at Liverpool on Friday last. It appears that the slave-trade has been carried on with great activity during the last few months. It has been calculated by the *New York journals* that 30,000 slaves have been landed in Cuba since the beginning of the year, and the accuracy of this statement is confirmed by the information now brought from Africa. Dr. Baikie and his exploring party are at the confluence of the Niger, and in good health.

On the morning of the 9th current, Prince Alfred arrived at Plymouth from his African tour.

The prolonged passage of the *Hero* on her homeward voyage with the Prince of Wales from America caused considerable alarm in the beginning of the week,—although many reasons rendered it improbable that any accident had happened. She came to anchor in Plymouth Sound at half-past nine o'clock on Thursday morning, without having suffered in any way from the severe gale in which she was caught.

MONEY AND COMMERCE.

On Thursday the Bank of England again raised its minimum rate of discount from 5 to 6 per cent. Perhaps our readers may remember that more than a month ago a city correspondent of ours recommended that the rate, which stood at 4, should at once be raised to 5; and had his suggestion been then followed, these successive rises from 4 to 4½, to 5, and now to 6, might have been avoided, saving commerce from the tedious uneasiness of those repeated changes. It is stated with complete confidence that these changes are all the consequence of the Bank of France having commissioned its agents to transmit it £1,000,000 of gold, and thus our remark last week, that the demand of a foreign bank for gold was affecting all our commerce, is fully confirmed.

We have, in another place, explained why we believe that this great annoyance to trade is caused entirely and exclusively by our own legislative restrictions, and not by any increased demand for capital; and, quite consistently with this, the *Daily News* of Thursday observed, that if the Bank meant to carry out the principles of the Act of 1844, it would raise the rate. It is, therefore, simply to meet the requirements of the Act that the Bank raises the rate; and a pretty Act it is which ordains a curtailment of the credit currency of the empire to the extent of £1,000,000, because the Bank of France takes 1,000,000 of gold out of the country. Because we lose this sum in gold, an equal amount of credit currency is extinguished. Like the *Daily News*, we say that the Bank has only raised the rate that it may comply with the exigencies of the Act; and looking to the diminution of the resources of the Bank, which we elsewhere advert to, we cast no blame whatever on the Bank. The whole blame for all the inconvenience which commerce may suffer from its conduct is due to the Legislature which compels it so to act.

We cannot, perhaps, better explain some of these inconveniences, than by quoting a passage from the Thursday's City article in the *Times*. "The rise in the value of money (rate of discount) checks the general tendency of foreign produce, and especially of the great staples such as most in demand—corn and cotton. Of course it is an annoyance to the dealers in those articles, to be exposed to the effects of an unexpected depreciation in prices; but, for the nation at large, the result cannot be otherwise than beneficial." So the merchants who are engaged in supplying us with corn and cotton, and who have sent out large orders for those articles, are to lose their fair profits by this unexpected depreciation of price—if any occur—and by the rise in the rate of discount which they must pay on all the additional capital they invest in the purchase. To deprive them of their fair rewards cannot be just, nor can it contribute to increase the supply of the articles. To us indeed it seems a great injustice that the men who entered into large operations for importing corn or cotton two months ago, when the rate of discount was at 4 per cent., with a good prospect of it so remaining, as far as they could calculate the probable relations of capital and enterprise, shall find themselves, perhaps, losers by their operations, in consequence of the operation of an Act of Parliament worked by the Bank of France. Both the depreciation of price expected and the increase in the rate of discount, must check their operations, and lessen the imports of corn and cotton, not to the advantage, but greatly to the disadvantage of the public as well as to the merchants. All the reports from the different markets, concur in representing the rise in the rate of discount as causing great disturbance, and by that neither merchants nor the public can be benefited.

It may be true, as our contemporary says, that moneyed capitalists "are receiving higher remuneration for the use of their money," but they and their property are insignificant compared to the vast amount of business which will be deranged and taxed to benefit them. The monopolist banks will profit much by the rise, and surely nothing worse could be said of the act than that it enriches these rich and idle-labouring capitalists at the expense of many poor and industrious traders. Our principal complaint of the act is that it was devised by a moneyed capitalist in order to protect and enrich his class; and was blindly adopted by a confiding and not well-informed legislature.

The stock market and the railway share market have been among the first to suffer. The funds have fallen in consequence from 1½ to 1, which on the basis of funded property amounts to a large sum. Railway shares, though the traffic returns for the week show in almost every instance an increase in the present year, have fallen from ½ to 1 per cent., and the holders of railway property who may be obliged just now to sell may lose a considerable sum. In truth, the rise in the rate of discount affects more or less all property except that in land, and is at all times to be deprecated except when it arises from an actual deficiency of capital in relation to the demand,—a sign of retarded enterprise in progress of adding to the wealth of the community.

In the week the corn market has been unusually, and prices have, in the whole, declined. The trade has been dull.

The produce markets, which were generally looking upwards, have felt the influence of the money market, and have been dull. Comparatively little business, except to supply immediate wants has been done, and prices are not altered. Rice is an exception, for which the demand continues to be active. This, in fact, generally varies as the price of corn varies, while other colonial produce varies inversely to the price of corn.

We see no alteration to notice in the provision markets. They are well supplied, consumption continues good, and prices are steady. Throughout the country we see no sign whatever of any kind of excess in trading, nor, except to supply immediate wants has been done, and prices are not altered. Some business is everywhere conducted with activity, but the sudden action of the Bank, and may here be in consequence hastened on their operations, or refrained from operating; but regularity and steadiness are now the general features of trade.

THE GOUTY PHILOSOPHER.—No. XIX.

MR. WAGSTAFFE'S OPINIONS OF ENGLISH GENTLEMEN "OF THE OLD SCHOOL," AND THEIR MODERN SUBSTITUTES.

It is my opinion that the class of men known under the generic appellation of "English gentlemen of the old school" is fast lying out; that few specimens survive; that "gents" are as rapidly displacing them as slop-work is displacing honest workmanship; and that character amongst us is as extensively veneered as furniture. It may be the acerbity born of my gout—or it may be purely the result of my unprejudiced observation of men and manners, which leads me to declare that a real and true gentleman laid fair to become as scarce in the nineteenth century as a dodo or an ichthyosaurus. But such is my belief, and I stick to it. Every age and every people have their own notions of the costume, the manners, the conversation, and the character of a gentleman. Costume, manners, conversation, and character, are all, though not equally, changeable; but yet the essentials of a true gentleman remain for ever the same, irrespective of time and circumstance, just as a man is a man, whatever may be his clime, his behaviour, or his creed. It is easy to feel what a gentleman is, but not easy to define what he ought to be. One savage, without either dress or manners, may be more of a gentleman than another savage equally unprovided with a dress coat or a code of etiquette. The king and chief magistrate of a rich and highly-civilized Christian nation, whose dress, manners, and conversation, are unexceptionable, and who ought to be a gentleman, may perhaps be a black-guard. A low fellow, with none of the characteristics of a gentleman, except his dress, may be an earl, or the son of an earl; and the gentleman in a fustian jacket, who trims the earl's roses and smooths his lawns for three shillings a day, may in everything, save his jacket, be worth a thousand of him. What, then, is a gentleman? It is an easy question to ask, but a difficult one to answer. What is honour? What is value? What is poetry? Though most people can feel, few can define any of these things; and the short answer to the first question is simply this:—"a gentleman is a gentleman."

Let me try to define him by a few negatives as well as positives. Firstly, of his costume. He must not be dirty, negligent, or slovenly, in his person. He must neither be meanly nor magnificently dressed. He must not wear gaudy and incongruous colours, or attract the eyes of onlookers with jewellery and finery. He must not affect eccentricity, or singularity; or dress himself in such a manner as to cause the vulgar to stare, or the judicious to grieve as he passes by. He must dress as Polonius (not at all a fool, though every actor who plays the part endeavours to make him so) advised his son Laertes to dress—in golden words of true wisdom. But dress, though it be the first and most obvious, is the least characteristic of the gentleman. In his manners he must not think himself the principal person in the world, the kingdom, or the company; but without parade of humility (which is in itself an offence), he must think himself the last,—or, at all events, he must act as if he thought so. He must not take in deferential politeness, either to man or woman. He must not take the first place, as if it were his inalienable right. He must not at table, or elsewhere, commit acts which, though they may be harmless in themselves, are contrary to the prevalent notions of his time and country. A hundred years ago a gentleman might get drunk after dinner without losing his social position; but to any one arising in our day to that high and illustrious rank, the slightest tendency to drunkenness—at table, or anywhere else, is fatal to his pretension. As soon as the flaw is known, he becomes a low snob thenceforth and forever. To be loud in talk is almost as great a derogation from the ideal of the character as to be "lond" in costume—(I know that the word is a slang word, but it expresses a meaning not to be reached even by a periphrasis, and may, for that reason, be looked upon leniently). To hear one man's voice overriding every other's, and one man's opinions thundered into the ears of people too timid—to indolent—or too courteous, to do battle with a Stentor—is fatal to Stentor's claims to be considered a gentleman.

And quite as essential as manners to the perfection of the character is conversation. A man in the dress and with the manners of a gentleman must not talk vulgarly, indecently, obscenely, irreverently, or even ignorantly (if the ignorance be very gross) without forfeiture of the rank to which his dress and his manners would seem to entitle him.

But granting all these three essentials—the world-be gentleman is not a gentleman if his heart be wrong. Dress is an ornament—manners are a grace—conversation is a charm; but these three may be possessed in all possible profusion by a blackguard. But these three combined with a noble heart and a sound judgement—the one balancing the other—combine to form the true gentleman, whether he be a Christian, a Mussulman, or a Pagan. And without the first three, as I have said before, the untutored savage may, in his simple manner, be very much of a gentleman, while his civilized compeer, who possesses them, may be very much the contrary.

Pope has said that—

"Worth makes the man, but want of it the fellow."

And Burns has said, in language still more emphatic:—

"A king on me! a belted knight;
A baronet, duke, and a peer;
But an honest man's above his night,
And that I'll be as true as steel."

But more than this may be said. A king's or a queen's sword laid over a man's shoulder, or a piece of parchment signed by a king or a queen, or by a minister acting with royal authority, may elevate John, or Thomas, as the

case may be, to high aristocratic rank. But there is a rank above all aristocracy—but not forbidden to the aristocracy—which declares that the true gentleman shall tower above every one who is not a gentleman, be the latter emperor or king, prince or duke, earl or baron. Queen Victoria could make John Wagstaffe a duke, if it pleased her,—and she; but she could not make him a gentleman, if nature, education, and refinement of life, manners, and conversation, had not done me the good office. My power over my own rank is greater than the Queen's; and every man can say the same, for it is in everybody's power to elevate himself to the moral peerage, and to become a gentleman; even although Fortune should have compelled him to sit on a high stool in a merchant's office—to hammer in a snail-shell—or to sweal at the plough-tail.

The man of independent mind is, as Buns says, "king of men;" but it is not enough to be a king without being a gentleman;—and what I take to be at the foundation of the gentlemanly character, as well as independence of mind, is the justifiable pride that flows from well-founded self-respect, in addition to a manly, tolerant, christian respect for other people. To believe with Pope—

"That every woman is at heart a rake,"

is to be a "gent" or a "snob" only. To believe that every man is a knave until you discover him to be honest, is also the characteristic of the gent and the low fellow. Such a man must be measured by his own standard, and by that he is self-convicted and self-condemned.

The gentleman of the old school was more particularly distinguishable from the gentleman of the new school, by his behaviour to women. The "gent," or the incomplete, imperfect, gentleman of our day, thinks too often that silly speeches and unmeaning compliments addressed to women, are sufficient to prove his courtesy and his gallantry. But without proper deference and respect, gallantry is an offence to the right-minded woman. The gentleman of the old school never passed a lady of his acquaintance in the street, and received a smile or a nod of recognition, without taking his hat off. If she stooped to speak to him, he held his hat in his hand all the time, and would no more have thought of putting it on his head until after her departure, than he would have thought of putting it on in the middle of the church service, or in the presence of his sovereign. The gentleman of the new school gives himself no such trouble. He does not treat a lady as if she were his social superior, but, at most, places her on an equality of courtesy with the man with whom he has dined or played at billiards at the club, or with whom he has had a betting transaction at the mess. To the gentleman of the old school "every woman was a lady," though she were but the chamber-maid, or the washwoman, and "every lady was a princess." And if she happened to be old, his manner was still more courteous, and his conversation still more tenderly respectful towards her than if she were young. Is it generally so in our day? I am afraid not; and I take it upon myself to assert, that the men of the present age do not, as a rule, respect women half so much as their fathers and grandfathers did; and that the estimate they form of the feminine character is much more Mahometan than is consistent either with Christianity or gentlemanliness. And this, I think, is at the very root of the evil, and forms the great distinction between the "gent" and the gentleman.

To protect that a true gentleman has no faults and no vices, would be to protect too much. Such a man would be

"The perfect monster, whom the world never saw,"

and which the world would not like if it did see. The true gentleman, if he have any vices, will strive to combat them, or, if his physical be stronger than his moral or spiritual nature, he will deplore his own weakness, even while yielding to them, but will certainly not exhibit them to the gaze of the public, or boast and brag of them as if they were things not only to be admired, but to be commended. In addition to the one great fault of want of due respect for women, there are three failings observable in the behaviour of men who move in the social ranks where gentlemen ought to be found, which are ostentatiously foreign to the public eye, and every one of which derogates, more or less, from the beauty and completeness of the gentlemanly character. These are, the habitual use of slang words, the practice of betting, and public indulgence in tobacco-smoking. Few will be found to praise the gentlemanliness of the two first of these habits, or to deny that they should be consigned to the "gents" as distinguished from the gentlemen; but I expect that I shall be met with indignant demurs upon the third point. I re-assert it nevertheless, and will now and hereafter maintain, with tongue and pen—and with all due courtesy of battle—against every compeer, that smoking, if it be done at all, ought to be done in the privacy of the smoking-room in a tavern, or club, or at a man's own fireside. To import the practice into the street, or the public conveyance, is an ungentlemanly act, for this reason, that it is selfish, and may inconvenience, distress, and annoy others, who may have no means of escape from the infliction.

If people of refined manners and delicate minds do not consider it proper to eat or drink in the streets, neither ought they to smoke in the streets. But eating or drinking in a public thoroughfare, vulgar as such acts must be considered, would in one respect be less offensive than smoking. They would not force the onlookers to inhale impurity from the common atmosphere, whereas the smoker compels the unhappy non-smoker, who is placed in too close contiguity with him, to breathe an air which another person has defiled. It would not be a gentlemanly act to walk the streets scattering asafetida, to invade the unoffending noses of the by-passers;

neither would it be gentlemanly, for a man's own pleasure, to go about beating a gong, blowing a cracked trumpet, or in other ways offending the ears of the innocent listener. And if not in those cases, can it be right in the smoker, for the sake of his own personal indulgence, to offend the nostrils of women and children, and of all the free citizens who hate smoke, and whose stomachs revolt at it? A man may be partial to chicken or to beef, to beer or to grog; but if he consumes either in the public way, instead of retiring to his own home to indulge in it, he shows himself to be a vulgar snob. And if such indulgences are so selfishly vulgar, is not that in tobacco-smoke equally so? John Wastaff, at all events, is of the opinion that it is; and he will adhere to his opinion, though he should stand for ever in a glorious minority of "One" upon the question.

Cleanliness and purity of heart, of manners, of conversation, and of person; respect for (his) image in himself as well as in others, independently of all considerations of rank or fortune, added to the polish acquired by learning on the one hand, and by intercourse with cultivated society on the other;—these in harmonious combination, form the external and the internal characteristics of the true gentleman. Where—oh! where is such a person to be found? John Wastaff knows about a dozen, and if he can discover a thirteenth, he will cheerfully make a pilgrimage to the Land's End, or to John o' Groats, to shake hands with him.

MEN OF MARK.—No. X.

JOSEPH MAZZINI.

[Who and what is Mazzini, whose name is so often in men's mouths? We requested a valued friend and correspondent, who has been acquainted with him for years, to answer the question for us, and the following is his reply. Our readers will thank us, we believe, for enabling them to look upon this portrait of an eminent man, drawn by a friendly pencil; for he has been so often portrayed by his enemies, and painted on *air*, that it is well for the sake of contrast, if for no higher purpose, to see that he can be painted on *canvas de rose*. If Garibaldi has been the hand, Mazzini has been the brain of Italy; and, as such, he is one of the most remarkable men of our age, whatever opinion his foes may have formed of his character. And in the present, and perhaps in any time, to be without enemies is not to be "a Man of Mark," whatever philanthropists may urge to the contrary.]

To win recognition from the bitterest and most calumnious of opponents, to have the work of a life acknowledged by those most interested in thwarting it, and most careful to deny its worth, to be crowned with oak and laurel by the most reluctant hands; this is the rare fate of *GIUSEPPE MAZZINI*. Consistently and recklessly writhed by journals, mobbed and threatened even in well-liberalised Naples, proscribed by the Piedmontese statesman, and hated by the French Emperor, the humble yet great Italian holds his place; is still lovingly and reverentially owned by victorious Garibaldi as the Father of Italy; while the *Constitutionnel*, speaking with authority, gives an Imperial adhesion to his "dream" of Italian unity; and the *Times* endorses that adhesion, though with the grudging—"This is a truth, but it comes from what quarter it may." Once before, the spirit of truth compelled by a stronger power, had slipped out between slanders those few notable words which do homage at once to his power and to his nobility,—Mazzini's lasting place is in the hearts of every Italian, and there his enemies will one day find him."

Just thirty years ago, a young man of five-and-twenty, a law-student, and the son of a physician in Genoa, was arrested in Piedmont, on suspicion of Carbonarism,—such Carbonarism as the King of Piedmont himself had professed only ten years before. In prison his thoughts were of the passing revolutions in France and Poland; and he came out, after some few months, to begin his life of exile and his apostleship, by founding the association of "La Giovine Italia," starting at the same time, and under the same title, at *Marcus*, a monthly journal, treating of the political, moral, and literary condition of Italy,—in a word, a revolutionary journal, aiming at Italian regeneration. Thirty years of martyrdom, of suffering and, nevertheless, and increasing self-sacrifice, and the boy's dream becomes a European necessity, something more than that,—"homework for the interest of Europe."

So much, at least, must be conceded to Mazzini, however widely we may differ from his views, and whatever strictures we may feel inclined to pass upon his conduct in the several circumstances of his career. His stern republicanism may be pronounced chimerical; his carelessness of political means and parties, and his distrust of princes and diplomatists, may seem unwise, and for a while brand him with the stigma of "The Impracticable;" we may doubt his policy and disapprove his alliances or his enemies; but, after all, we must allow that the work he set himself to do—which thirty years was almost only his,—is done, and his prophecy fulfilled. His worst enemies must bow their heads to that.

And his friends may also be content with it. To them, however, he is indeed the prophet in the complete sense of the word: with all his holiness, all his dignity, and all its more than royal claim to allegiance and to worship. No man ever more ardent love, more thorough trust and following. From the noble lay-brothers Bandiera, who, penetrated by his doctrines, could only—even against his persuasion—dedicate their lives as an example to their countrymen; to old Forstè—Pellico's fellow-prisoner at Spielberg,—whose first act upon being liberated was to seek the Apostle, and offer him his service; and yet more recently to Pisemmo, leading that forlorn hope which won the thundering of Sicily and the first vote of Garibaldi's triumph; men of all ages and all classes and conditions have

gathered to him, like warriors round a beacon, ready and determined,—a brotherhood of most devoted charity. And not alone by his Italians is he loved and honoured. Carlyle spoke out for him in England, sixteen years ago, such words of hearty and well-judging praise as, on the score of personal character, should have shut the mouth of any honest enemy for ever. The one noblest Frenchman of them all, good old Lamennais, was his closest friend and comrade. The Poles loved him as only exiles love, and esteemed him beyond all men. Those who have known him intimately, speak of him with more than womanly affection. For he himself loves and trusts; and love and trust ever command their like.

Thirty years a conspirator; and yet his trustfulness is almost child-like. This is the secret of his wonderful escapes from danger; for his fearlessness and daring are not doubted, whatever his opponents may say. In *Marcus*, the police of the citizen-king could not for a whole twelvemonth track him, though his Italian propagandism never halted. In Switzerland and in England the hired assassin, face to face with him, quailed, confessed, and asked for pardon. In Paris or in Genoa, under double sentence of death from Charles Albert, and wanted by the Imperial police, he went and came, as his presence was necessary, and no man stayed him. Only he was not so inculpable a general, while he confronted peril, to foolishly give himself up to those who sought his ruin. Royal Saul never called young David cowardly for hiding in the caverns of Adullam; and none who ever stood beside Mazzini, ever thought of his being charged with cowardice. How Garibaldi, the generous, the brave to very recklessness, would laugh to hear his friend accused of selfish fear; the friend of whom Garibaldi's own general, Medici, a hero too, wrote, in 1819—"His conduct has been for us, who were witnesses of it, a proof that to the great qualities of the citizen Mazzini joins the courage and intrepidity of the soldier." Medici writes this in telling of Garibaldi's advance on Monza, just previous to the capitulation of Milan, in which advance, and afterwards during the retreat to Como, Mazzini served as a private soldier. "In this march, full of difficulty and danger, in the midst of continual alarms" (Medici is now speaking of the retreat), "the strength of soul, the intrepidity, which Mazzini possesses in so remarkable and unobscured a degree, and of which he afterwards gave so many proofs at Rome, never failed him, and excited the admiration of the bravest."

It was during this march that he gave up his cloak to one of the young Volunteers more slightly habited than himself. The same tender solicitude for others was evinced at Rome, where he found time on one occasion to take an English family to the palace-top, and showed them the city defences, in order to allay their fears. His finances and tact in moments of difficulty are equally remarkable. Once a deputation from some part of Rome demanded of him an interview, requiring the dismissal of the "military staff." "From whom did they come?" he asked. "From the people." "Well, he was the people's servant, but not their slave. If the people trusted him, well and good; but he could do his best if not, they could withdraw the authority with which they had invested him. But when they said the people, how many had deputed him?" "Some few hundreds only." "Some few hundreds," he remarked, "were not the People; but he would listen even to the few. Which members of the military staff did they wish dismissed, and what the complaints against them?" The complaints did not even know who constituted the staff; their objections were only general; they saw their error, and retired. But perhaps the most striking of all anecdotes concerning him is that of his behaviour after the French had entered Rome; when, to prove that his power had not been maintained by terror, and also to observe the bearing of his Romans, he for several days walked unarmed and unprotected through the streets, till his friends told him he was mad. But no man touched him, or said evil word. Even the French soldiers were awed by the sublime spectacle of that pale, worn, gray man (his hair grizzled with the past month's anxiety and toil) walking amidst them, severe and silent, like the Ghost of the Republic.

In private life, Mazzini is a true gentleman, with a ready courtesy and genial warmth of expression that was regarded upon the instant. He is no orator, as Kosuth is; but in the midst of a few friends, none more eloquent, or pours himself in a conversation more rich and various. At the same time he is singularly unobtrusive, and averse to anything like show or notoriety. His mode of life is of the simplest. His lodging was for years in London, and he has been so ever since. His property is his acquisitions. His little patrimony he gave to the Italian cause. He, to whom thousands have entrusted their lives and fortunes, whose means only of late were said to be equal to Garibaldi's; who was able but recently to fit out two expeditions to the Roman states (suppressed by the Piedmontese authorities); he knows no luxury or self-indulgence except his cigar—his one constant companion—his only home-hobby and console.

In person Mazzini is rather below the middle height, slight, and spare (in youth, like our own Milton, he is said to have been exceedingly beautiful), with a small but finely-proportioned head; eyes like those of fire; black hair (prematurely grey since the occupation of Rome by the French); a face sad and lofty, yet so stern as Dante's, but full of heroic gentleness; and a hand that grasps you with right Savon's strength. That is the outward presentment of the man who has set his stamp upon Europe—a stamp such as none has set since Lycurgus; a man whom, if it please you, you may compare with Lycurgus for his will, and for his strength of character, and for his genius in organising and commanding men; but not for the fierce licentiousness of Ignatius's early days, nor for the perversity of intellect which made the Spaniard seek his good in that strange mixing of the devil so happily known to the world as Jesuitism. For Mazzini's private life has been always pure—impeachable in everything; and his public creed, consistently acted out, has been ever the doing good only by good means.

On that question of continual, however hopeless, immutation which Mazzini incalculates, two opinions may be held, even as a mere matter of policy. While favour and his anticipations admirably represent it as impeding the progress of Italian freedom, Mazzini's friends on the other hand insist that he has prepared and been the best, and indeed the necessary preparation for all that has been

* But misled and trapped by Austrian spies, to whom an English House Secretary gave their unaided letters.

accomplished. It is, indeed, hard in the long series of unsuccessful enterprises in Italy—blamed because unsuccessful—to find one looking more gloriously hopelessly at the outset than that which but a few months since had its poor beginning upon the coast of Sicily. That, too, it is said, was in the Mazzini programme. And is not the blood of the martyrs the seed of the church? Verily, it was in the beginning, and shall be.

Of Mazzini's public acts and written works we need not give a detailed account. It is the old history of apostolic endeavour: his writings a tissue of protests against present wrongs and longings for a higher future; his deeds a series of plots, if you will, of conspiracies, and insurrections. In 1831-2 he organized his "Young Italy," from Marselles, floating Italy in pamphlets, through the aid of Italian merchant seamen touching at that port. In 1834 he planned the expedition into Savoy. Immediately after that failure, he, in conjunction with his Polish friends, founded the "Association of Young Europe," as the nucleus of a new ally alliance of the peoples. In 1837, hunted here by Italy, France, and Switzerland, he came to England, and remained here, "conspiring," till the revolution of '48. In February, 1849, he was elected a member of the Tuscan provisional government; and on the 29th of March, 1849, ascended the Capitol, to stand before the world as Roman Tribune. The acts of that triumvirate are matters of history. Worthy of the most heroic days of the Eternal City, they testify at once to the greatness and capacity of the statesman, and the magnanimity of the man. This was his success, a successful consolidation, however transient. And yet he oversteps success to the one grand height beyond. Greater even than triumph, so far as he is personally concerned, is the self-alignment of his recent letter to Victor Emmanuel. As, during the Milanese campaign, lay the republican, and, for his murdered friend Buffini's sake, the personal foe of Charles Albert, kept his republicanism in leash, and stood, as faithful headman might, beside the king while fighting honestly for Italy; so now, let who will declare to the contrary, he gives up all for Italian unity, ready, in his most patriotic self-sacrifice, to let it be so, and let his faith in God's providence, to renounce that dream of "destruction of Italian republicanism," as the price of a really united Italy, an Italy strong enough to live her own life, whatever that may be. How great that sacrifice, only those who have shared his dream can in any way appreciate.

The great outward deeds of the world shadow and eclipse all else. Art, science, literature, all are dwarfed before the giant stride of peoples for their liberties, or that of nation pitted against nation, albeit in the valour of kindly wars. So we have spoken only of the politician. But Mazzini would have been notable under any circumstances. Master of his own Italy, at the same time thoroughly conversant with European literature, he is not only the commentator upon Dante, but also, or rather was before 1848, an esteemed contributor to the highest and most thoughtful periodicals of France and England. He could spare time from politics to provide for the relief and education of poor orphan-grinding boys in London; and from political polemics, to write in his *Apostolic People*, for the benefit of Italian workmen, a sermon "On the Duties of Man" of which Kingley or Maistre would be proud. There is no such manifest exposition of the errors and shortcomings of the Economic and the Socialist Schools, as that contributed by him to the columns of the *People's Journal*; nor any so profound criticism on Carlyle as his in the *Westminster Review*. His *République et Royauté en Italie* is one of the very few good histories that exist. In all things, indeed, Mazzini is a man of mark, and what is better, a man of worth.

TOWN AND TABLE TALK.

(From our Pall Mall Correspondent.)

THURSDAY EVENING.

THE Empress Eugénie arrived at Claridge's Hotel this afternoon from Dover, en route for Hamilton Castle, N.B. She travels *incognito*, and without any sort of ostentation. She is said to have arrived without the *prestige* and attendance due to her high rank, and hostile rumour is of course busy with the motives of her journey at such a season. But the Duchess of Hamilton is one of the nearest relatives of the Emperor Napoleon—his first cousin in fact,—and I hope there is no foundation for the gossip that is afloat.

The arrival of the Prince of Wales at last has removed the anxiety, which, although perfectly natural, was somewhat exaggerated. His delay is chiefly to be attributed to the prevalence of eastern gales. It is to be recollected that the *Hero* carries 91 guns, has a 600-horse power, and could for less than eight days. The icebergs of the previous winter seldom last beyond May or June, and are never seen at the end of Autumn. There were five ships started in company, and they must have often gone at half speed and waited on one another.

The news from China has divided—although it has not wholly superseded—the interest which has been kept up by the Italian struggle for so many weeks past. This interest in Eastern affairs is all the more lively from the differences amongst the morning papers as to the exact character of the "latest intelligence," and his learning upon the question of peace or war. Considerable confusion arises from the difference of tone between the telegraphic and the written accounts. The discrepancies are of course increased by the greater distance. The papers that announced that peace had been actually secured, may be formally in the wrong; but I believe that they will turn out to be substantially in the right. I believe that negotiations are not abandoned, but only postponed. We shall probably be in possession of the actual treaty on the arrival of the next mail. Lord Elgin and Baron Gros were quite right to "go on" at the least symptom of wavering or prevarication on the part of the Chinese emperor. The British portion of the indemnity was fixed at eight millions of taels. A tael varies from 6s. to 7s. At present it passes for about 6s. 4d., which brings our bill for war expenses up to two millions seven hundred thousand pounds sterling. This will be a good help to the Chancellor of the Exchequer, and will assist in reducing the Income Tax, which is so severely felt by the possessors of small incomes, who pay their share

of all the other taxes besides. The best-informed people, however, are fully of opinion that the treaty will be signed at Peking—on the conditions so properly insisted upon by Lord Elgin. The battle at Tientsin was decisive, and is all the more valuable because it was on the scene of our former repulse.

There is no event in history more touching than Garibaldi's farewell of Victor Emmanuel, and his unaffected and unostentatious departure for his island amidst the affectionate rivings of the troops, and the blessings of the population of Naples. When he next unfurls the banner of freedom, it will not be hand-drawn, but thousands of ardent young men, who will flock to his unstained standard from every country in Europe. Our trans-atlantic colonies are not easily moved to enthusiasm for any distant enterprise, but the fame and reputation of the latest Washington must reach even across the wide Atlantic.

The London Improvements proceed with a slowness that is truly provoking. There is one great change which promises to be commenced next year, and of which there are some hopes, since it is not in the hands of any public board or corporation. The recommendations of the Commissioners for constructing the Law Courts and Offices are about to be acted upon. The whole space from Lancaster-lane to Temple Bar on the east and west, and from Lincoln's-Inn to Fleet-street on the north and south, is proposed to be cleared for the erection of the Courts of Law and Equity, and the several offices connected therewith, which are now scattered about London and Westminster. If this scheme be carried out, it will be the greatest architectural and sanitary improvement of modern times, and will act as an example and a stimulus to dilatory and jobbing authorities, departmental, municipal, and parochial.

The absurd spectacle of the Lord Mayor's Show has contributed to stop the way for an entire day. I hope we shall live to see the abolition of three great shams of modern days, the Pope of Rome, the Lord Mayor of London, and the Lord-Lieutenant of Dublin Castle.

The new Station for the Brighton Railway at Pimlico, although not quite finished, is the most commodious yet erected in the Metropolis. It is a great convenience to the West end, and, by its distance, but as avoiding the crush through the City thoroughfares. Faced now to Blackheath Palace, it is the nearest terminus to all places west of Regent-street and north of Pall-mall. It will accommodate the great juries of Chelsea, Hrompton, Hammersmith, and Paddington. The Brighton Railway is the most punctual in England, and it is no wonder that the Queen of Watering Places should be fond to overdoing.

Mr. Balfe's new Opera is in full rehearsal at Covent Garden, and will be produced at the end of the month. This is not a moment too soon, for the old ones are getting tiresome. The last production, the "Night Dancers," by Lehar, is not new, although it has never been much acted, and not at all to the taste of the West end. Mr. Balfe's work is to be a grand opera, with relative, without dialogue. The libretto, by Mr. Palgrave Simpson, is founded upon the old story of Pyramus, the Bravo of Venice, which was dramatized about thirty years ago for Mr. Henry Johnston. It is composed for two tenors, one baritone, and five basses, with the usual measure of two soprano. The parts are to be taken by Miss Prynne, Miss Thirwall, Messrs. Harrison, St. Albans, Wharton, Larnesse, Corri, Walworth, Dittin, and Gratton Kelly. There are about twenty-four pieces of music, besides several light and characteristic ballads, with an incidental ballet divertissement.

"Robin Hood" will probably run to Christmas at Her Majesty's Theatre. It has entirely eclipsed the Italian Opera, which is played on the off-night to empty benches.

Médane Colarte has at last found a melodrama, by Mr. Leslie, which suits herself and her company, and which has been admirably put upon the Lyceum stage, and played with great success.

The Olympic, too, has had its usual good fortune in the production of a little piece which exhibits Louisa Keckley as an *Ingénue*, a species of young lady very familiar to the French stage, but little known amongst us. The last remarkable instance was "The Little Treasure" at the Haymarket, which had a remarkable run, but has since been laid on the shelf.

One of the most agreeable Picture Exhibitions opened in London for a long time is now on view at No. 4, Waterloo-place, which is taken by Messrs. Agnew for the purpose of showing a collection of Mr. Froel's images of the most famous personages of the world, and of the most famous events of popular works, of which the greater part are in the hands of the engraver. Most of these pictures are familiar to the frequenters of the Royal Academy. They include the well-known "Home and the Homeless," the property of Miss Burdett Coutts; "The First Break in the Family," belonging to Mr. Brocklebank, of Liverpool; "The Motherless Bairn," one of the earliest and best, the property of Mr. Culver Toshin; and the "Conquered, not Subdued," in the possession of Mr. MacConnell, of the North-Western Railway, and half a dozen others. The *chief* scene would be pronounced the "Sunday in the Hackwoods," although for my part I would prefer the gentle home-scenes of Scottish cottage-life, which remind every spectator so forcibly of Robert Burns—so full as they are of the happy and religious parents, the fresh and innocent childish faces, and the "bonnie lassies" of the Ayrshire Bard. Mr. Froel's pictures are not so glaring and gaudy as some of our more ambitious modern productions, but they are full of poetry and truth.

ENTRY OF THE KING OF ITALY INTO NAPLES.

[FROM OUR CORRESPONDENT.]

NAPLES, 16th November.

THE long-expected event, for which preparations have been during so many weeks in progress, has come off. The King of Sardinia has entered, as a conqueror, the gates of his native, and the anticipations of an anxious crowd of tourists, and an excited mob of Neapolitans, have at last been realized. Ever since the King entered the States of the Church, it was known that he was coming to Naples, and the mayor and corporation, or the Neapolitan equivalent to these functionaries, at once commenced the necessary preparations:

gigantic scaffolding rose slowly in the principal places of the city, each gradually assuming a greater and less finished aspect under the untiring exertions of a man and a boy. There was always the same man and the same boy perpetually hammering, each perched astride of a pole in mid-air, preparing to receive Victor Emmanuel. I once saw three men at work on one erection, but that was under the influence of unusual pressure. The result of these labours at the end of a month, made themselves apparent in all parts of the city, giving it a curious unfinished look, as if an order had just come to erect a number of public buildings, and then were the buildings actually erected. In vain the King waited to be informed that all was ready, he amused himself in the mean while by taking Capua. It was an easy thing for him to take Capua. His exertions were nothing to that of the man and the boy, incessantly hoping to be ready in time.

At last the royal patience was exhausted, and the royal message arrived to the effect that at ten o'clock on the morning of the 7th Victor Emmanuel was to be expected in Naples. The mayor and corporation were in despair; they implored his Majesty not to come, or, if he must come, to do so *incognito*, and make his triumphal entry later. They made frantic efforts to line the Toledo with statues of young ladies and gracefully-extended arms, and succeeded in finishing six young ladies, putting up the balustrade of six more, and a row of pedestals, each surmounted with a statue, so that as his Majesty drove down the Toledo, he saw each place through which the goddesses had passed. Most of the public buildings were concealed by the unsightly scaffolding to which I have alluded, and which were, I believe, to have been covered with cloth and festooned with flowers. In fact, instead of having on their ball-dresses, they were exhibited in their crinolines, and the mayor and corporation were proportionally disconcerted. The only consolation was, that they had spent £16,000 in the attempt; and it is to be presumed that the man and the boy will never again find it necessary to hasten for a livelihood. However, it is not the public entertainments or decorations on occasions of this sort, which are gratifying to the feelings of a townsman, more especially when he is engaged in the somewhat unusual operation of turning his friend out of his house, and living in it himself. If circumstances have compelled that friend to absent himself, a cordial reception from his late servants is always pleasant to the new master, and if the populace of Naples could not raise scaffolding, they could, at least, lift up their voices.

But the populace of Naples are sensitive to cold and damp. They no more like being exposed to rain than they do to the fire of the enemy, so when the morning of the 7th set in cold and stormy, those who knew the new subjects of the King might have told him what to expect. Whether they did or not, the King acted as if their opinion mattered very little, for he arrived in the city an hour before his time; even those dashing spirits who had determined to face the inclemency of the weather were still at breakfast; and when I went to the Royal-square, and saw him drive into it in an open carriage-and-four, with Garibaldi on his left hand, there was a single file of soldiers and a single file of spectators on each side. A feeble cheer welcomed him to his new abode; but the moment can hardly have impressed itself upon the mind of the royal visitor as suspicious. Had he not been obeying a noble impulse, and acting the part of a disinterested and high-spirited sovereign, it is possible that, on entering the house of Francis he might have felt a twinge of conscience. He might, as he wandered through those rooms where the music of the exiled Queen was still lying about, and all the evidences of a hurried departure apparent, have experienced an emotion; but the opinion of his Majesty does not admit of any such weakness, and he came out upon the balcony as if he was in the habit of smoking his afternoon cigar there, and bowed benignly over the sea of umbrellas which were extended beneath him; for by this time the square had filled, and from beneath the umbrellas there rose a cheer that drowned for a moment the pattering of the rain. Behind his Majesty stood Garibaldi in his plain red shirt, to whom the balcony by right belonged—there is any right in the matter. But Garibaldi, whose taste does not lie in handsome houses, or in popular demonstrations, seemed extremely bored with the whole business, and vanished ten minutes afterwards; nor could the King or anybody else find him for the rest of the day. It was said that his Majesty and the Dictator had not agreed upon certain points it was difficult to imagine, and that Garibaldi had gone to sit for his picture, which he finds a good way of recovering his equanimity on these occasions. Anyhow, the King was repentant, or said to be, and we half expected to see an advertisement in the second column of the *Indipendente* (Alexandre Dumas' paper) next morning—"If Garibaldi will return to the bosom of the disunited Kingdom, he shall be forgiven."

It is sufficient for this little controversy that night at the theatre. Whether it was that the King was dissatisfied with his reception, or his benefactor, who had just presented him with Naples, or with Boicelli's dancing, was difficult to say. The San Carlo was crowded to overflowing, and the clapping of hands was deafening, but the King looked black. Had the ballet come after the opera there would have been a good reason for this, but the proceedings of the evening were opened by the ballet, immediately after which his Majesty retired, so that there was really nothing to complain of on this score. Next day there was a grand *Te Deum* at San Lorenzo, to which the King did not go, and Garibaldi took his departure for Capri. On the whole nobody is satisfied just now at Naples. The Piedmontese are disgusted because the Neapolitans have not shown more enthusiasm. The Neapolitans are disgusted because public affairs are going to be administered by Piedmontese. The Garibaldini are disgusted because the Piedmontese have come in at the last moment, and their occupation is gone. The King is not content because Garibaldi refuses to be made a prince, or a field-marshal, or a grand cross.

Garibaldi is hurt because the services of his army are not sufficiently recognized, and he meets with ill-treatment from those quarters which owe him most. In spite of the opposition of the Sardinian Government, Garibaldi has succeeded in placing the crown of Naples upon the head of Victor Emmanuel, and yet he has brought into Naples by the King as if he was one of his staff. The streets are lined with Piedmontese soldiers, not with Garibaldini, whose towns Naples is, and there is no ceremony of the transference by the Dictator of his power to the sovereign.

Victor Emmanuel cannot riding rough-shod into a city which is only his through the unparalleled generosity and bravery of a single man, whom he thinks to satisfy by empty honours, while he refuses to grant any one of his requests.

"Il Re Galantuomo" has been too much in the society of Count Cavour of late, and seems to have had aside for a time those qualities which earned for him that flattering title. Let us hope that the reports of winter may soften the asperities which were so evident in quarters where they are most to be deprecated, and that moment may be taken by the Sardinian Government to enlighten the king, so that that army which is at first stigmatized as a band of adventurers, but the fruits of whose gallantry it has appropriated with a rapacity akin incredible to itself and injurious to the cause of Italian liberty.

We have no very late news from the front; by the last accounts Ciadini had advanced to the walls of Gaeta, and, ere you receive this, that fortress will probably have capitulated. The Neapolitans, who were posted near St. Agata, fled at the approach of the Piedmontese, without waiting to exchange a shot. The Sardinian fleet were about to cut off their retreat, and ten thousand prisoners must inevitably have fallen into the hands of the Piedmontese, when Admiral Tison fired a shot and sent an insolent note to Admiral Persano, threatening him if he ventured to continue his cannonade. The conduct of the French admiral all throughout these proceedings has alike been indefinable and unjustifiable. If the doctrine of non-interference is not a mere empty phrase, such interference calls for the strongest remonstrance on the part of the British Government. Mountainous is the military effect of rendering the French even more unpopular than they are already among the Italians, who are beginning to estimate these champions of their independence at their right value. A few days ago a French body of Neapolitans crossed the frontier at the suggestion of the large commandant of the nearest town in the Papal States, where they surrounded instead of the King's army. The King is said to have 15,000 men in Gaeta, while he refuses admission, on the plea of limited accommodation, to 15,000 more who are encamped between the walls of the fortress and Ciadini.

FARD'S PICTURES.

As an exhibition of some of the works of Thomas Fard has been opened during the week in Waterloo-place. Let every lover of Art in London go forthwith and visit it. If the lover of Art reside in the country, let him come to town as soon as he can for the especial purpose. The exhibition includes no more than ten pictures; but the scantiness of the number, so far from being a drawback to the pleasure of the spectator, increases and refines it. The eye and the attention are not distracted by the multiplicity of objects, and the judgment has full leisure to examine into the sources of its gratification, and to render reason to itself for the conviction that the works of a master are sufficient to its verdict. Thomas Fard has long been known as an artist of high merit, the equal, in many respects, of Wilkie, but not his rival or his imitator. But even those who entertained a vivid remembrance of his genius, from the works he has so recently exhibited at the Crystal Palace, and elsewhere, can scarcely, we think, have been prepared for the admiration which this collection will force upon their minds, that an artist as great as Wilkie, in most respects, and with merits of his own that Wilkie never reached, is still living amongst us. Though Wilkie was a Scotchman, his sympathies were not wholly Scottish, but sought for subjects wherever they were to be found, especially in England and in Spain, and rarely in his own country. Fard is much more national, and it may be truly said of him, on the evidence afforded by this exhibition alone, that the Scottish character never found in Art, though it has often done in Literature, an exponent so subtle as well as so broad, and so thoroughly alive to its pathos as well as humour.

As a colourist, brilliant without exaggeration, and clear without coldness, he will stand comparison with any painter of this or any other time; while for mistaking in the smallest details and accessories, he is as conscientious as Millais, and a great deal more natural. Those who look in pictures for the grand and the magnificent, for the tragic and the terrible, or for the lighter and more displays of fancy and imagination, may be disappointed in the works of Fard; but those who admire nature in its homeliest and most touching simplicity—who can sympathize with the joys and the sorrows of the lowly, for the sake of their common humanity; who think Shakespeare's genius as good as his kings, the grave-digger's as good as his emperors; who are as much attracted by the Caddy of the *Cherry Ripe* as by his Richard Crook of Lion, and his Elsie Dunsen as exquisite as his Queen Mary—will find in the works of this genuine artist, a source of true pleasure, only lessened by the knowledge that one who can do so well, has done so little.

Although we consider all the pictures in the collection to be of high merit, there are three more especially that seem to us pre-eminently characteristic of the mingled power and tenderness of his genius,—numbered 3, 6, and 7 in the catalogue. No. 3, "The Motherless Balm," was exhibited at the Royal Academy in 1855, and attracted much notice. It represents a lovely Scottish matron—wife of an honest ploughman—sitting alone in her chair, with her youngest-born at her bosom, and all her elder-sons around her—startled by the sudden appearance of a ragged callant, starving and without a mother, who has come, with mute looks, to implore their hospitality. Her own eldest-son, who looks every inch of him as if he had just finished a comfortable "cog of parich," and did not know his hunger more, eyes the new comer inquisitively; while her younger sister, with the quicker sympathy of her sex, sees at once how the matter stands—and hands the stranger her own unfinished "piece" of oat-cake; upon which her over-cautious grandmother lays an embargo, until inquiries be made, which shall show that the charity is not undeserved. Burns himself could not have told the story better in his immortal verse, than Fard has told it upon canvas.

Perhaps of a still higher degree of excellence is No. 6, with the title of "Conquered, but not Subdued," exhibited by the Glasgow Art-Union in 1856. The old boy in the corner, placed there after severe personal correction by his offended mother, who is coolly pouring poison into the ears of her utterly unwary of his presence, is the very perfection of art—in drawing, in sentiment, in colouring, and in every nautilus grace that constitutes a work

intrigues and conspiracies amongst Jacobites and Hanoverians, the whole illustrating, so to speak, by two tableaux from Hogarth, the "March to Finchley" and "England." The scenes in which these tableaux occur have nothing to do with the actual business of the play; but they inspire it, nevertheless, with a curious kind of living interest, and bring before us very strikingly the turbulence, commotion, and party strife of the period. Mr. Beverley, indeed, has bestowed extraordinary pains upon the scenery, which is everywhere admirable, as a transcript of the London of a hundred years ago, especially two moonlight views of the river, and the exterior of the theatre, executed with remarkable skill and fidelity. The principal part is played by Mr. Webster, a certain *Sir Andrew Sideron*, who begins his career a Jacobite, and ends a king's spy. The airy trifling and nonchalance under which he conceals his designs in the early passages, and the violent storms of passion and conflicts of feeling through which he passes as he pursues the catastrophe, were rendered with artistic fidelity. The character is one that presses heavily on the physical energies of the actor, but Mr. Webster was fully equal to its demands, and rose in the last scene to a height of tragic power which in the wide range of his *repertoire* he has seldom surpassed. Next in dramatic importance, and more prominent and decisive as an individual portraiture, is Enoch Flecker, a secret emissary of the government, who, by abstracting certain documents from a bureau, seeks to compromise the life of a Jacobite gentleman in whose service he lives. He is further mixed up in the plot through the agency of a love affair, and being entangled, more or less, in all the threads of the story, he is everywhere in the scene, and may be regarded as the main genius of the action. In the development of this part, whatever may be said for the rest of the play, Mr. Phillips has discovered a higher dramatic faculty than in any of his former productions. The impersonation of the part by Mr. Toole was a masterpiece, both as to conception and execution. The mischievous twinkle, the velvet stroke, the sleek dogging look, and the balistical cat-like treachery of the eyes, as if he were always watching his prey, without seeming to do so, and ready to spring upon it when the opportunity came, were quite perfect; nor did the actor fail even in the last burst of frantic despair, when he finds himself betrayed into the hands of his mortal enemy—a passage hard for a comedian to persuade his audience to believe to be real in the person. These are the prominent figures of the play, and they were finely acted. For the remainder, we must return to our original axiom, and in the name of the economy of time, protest against undue length. There is too much dialogue, and notwithstanding the complications of the plot, too little incident. The four hours might be advantageously compressed into two; and when this shall have been done, partly by judicious excision, and partly by getting the piece into quicker working order, there is no doubt that it will amply repay the pains that have been expended upon its production.

A VISIT TO GREENWICH OBSERVATORY.—No. II.

Before we shew the atmosphere is electrified positively, but the electricity collected during a shower is negative; and it was one of the earliest results of observation on the electrical state of the air, that in clear weather the atmosphere is charged with static electricity of the negative kind. One of the first observers of this was Volta, who considered this was due to evaporation, the water having its natural electricity decomposed in the process, and the positive electricity passing off with the vapour, while the negative remained on the ground. Although some difficulties—such as those offered by the experiments of Franklin and Faraday, which showed that evaporation could not be a decomposition or friction, were not sufficient to stand in the way of a correct scientific solution, the facts are certain that the positive state is its ordinary condition, and that with a downfall of rain, which is in reality the return of the moisture to the earth by the condensation of vapour (or the counter-phenomenon of evaporation), we have an opposite condition of the atmosphere. No sooner is the shower over, and evaporation again taking place, than the positive condition is restored. We are thus impelled to the belief that the electricity of the air is not a cause of meteorological change, but only an effect.

Mysterious as is the force we call electricity, it is even more mysterious in another form—magnetism. Indeed, the study of the physical forces is one of the highest and most interesting for the exercise of man's intellect. Out of heat we get motion; from motion, heat; from motion or heat electricity; from electricity heat or motion. All forces are correlated, and seem in ultimate analysis to be one and the same. Force is never lost. One state of it may be annihilated, but it is instantly put in another. What we lose as heat we get as motion or electricity; what we lose as motion or electricity, we find as heat; they are changed from one to the other and back again, just as we play upon these words. So the phase of force we call electricity is evaporation, we have an opposite state of it, which, coming in one form, is transferred immediately into another. Electricity can become galvanism; galvanism, electricity; electricity and galvanism both alike may merge into magnetism; or magnetism into either.

A little needle, a bar of soft iron, can imbibes the magnetic influence, and immediately one end points mysteriously to the magnetic north. We turn it forcibly to the east, west, or south; but no sooner is our grasp relinquished than it flies back to its mysterious pointing. No certain is this result that we sail our ships over the trackless ocean, and intrust our fortunes to the unerring guidance of an inch of iron.

Not the mystery ends not here. There are other mysterious forces which influence the magnet. There is a slight variation—immediately slight from day to day or month to month—of the point to which the magnet turns; and occasionally, too, the magnet exhibits violent tremblings and shakings, as though possessed with paroxysmal fits of rage or passion. If we take a mere bar of iron, and rest it on a point or pivot, it will remain perfectly level, if properly balanced, and in any direction in which it may be turned. But magnetize the same bar either by electricity or galvanic action, or by contact with another magnet, and it will not only arrange itself in a nearly north and south direction, but it will dip downwards. In England, at present the derivation of the magnetic needle at all the places situated in a line which runs through Yarmouth, Whitby, Hull, and Southampton 21 degrees 40 minutes; at Newcastle and Swans 22 degrees 35 minutes; at Liverpool 22 degrees 50 minutes; at Edinburgh 23 degrees 25 minutes; and at Glasgow

and Dublin 23 degrees 45 minutes, decreasing about one-twelfth of a degree annually. The dip of the needle at Greenwich at present is about 68 degrees, and which element is also subject to an annual decrease. The deviation from the true north is not the same everywhere on the earth's surface, but is subject to local variations; for example, at Boston, in America, the direction is 54 degrees only west of north. This duration, ordinarily termed the variation of the compass, was first detected in the memorable voyage of Columbus, amongst whose sailors it caused a clamorous demand for the return of the ship, under the belief that their compass had lost its virtue. Not only does the direction of the magnet vary in different places, but long-continued observations have shown that it does not continue the same even at the same place, and that there is in reality a slow progressive variation, as before stated, or so to express it, travelling of the point to which it turns.

Thus, taking London as the place, the declination of the needle in 1576 (as observed by Norman), was 11 degrees 15 minutes east of north, diminishing, as shown by other observations, to 4 degrees 5 minutes in 1634, and pointing due north about 1657–1668. After this, in 1660, it was 34 minutes west of north, progressing constantly in this contrary direction, when the rate of west variation, 27 degrees 16 minutes, was attained. The next year this westerly tendency began to be diminished, and has continued to the present time. Besides this variation in the direction, the dip not only varies at different parts of the earth's surface, the needle becoming vertical from the north end at the north magnetic pole, and from the south end at the south pole, but by similarly long-continued observations it is found not to remain identically the same even at any given place. Moreover the dispositions of the magnet are not uniform throughout the year, and there are diurnal movements.

There are then ordinary direction, vertical and lateral movements of the magnet to be observed, and extraordinary movements, such as tremblings or vibrations, and those greater paroxysmal disturbances, known as "magnetic storms."

For these observations three magnets, of two feet in length by an inch and a half broad and a quarter of an inch thick, with their necessary adjustments, are provided in the interior of the observatory; one for the declination, and two others for the investigation of the variations of the vertical and lateral components of the magnetic dip, from which the variation of the dip and of the whole force of magnetism may be inferred.

So nicely balanced and so delicately sensitive are these magnets that even the steel hands of the mean-time clock in the same apartment, exert an influence on them, and the action of the iron gear in the same room has to be accounted for in the results obtained. The thousandth part of a grain would interrupt the balance of the vertical magnet, and a stray spider creeping into any of the boxes, would effectually arrest with its web the magnet suspended within.

So slow and so minute are some of the magnetic variations, as we have already observed, as to be perceptible only in their accumulated degree after the lapse of time. In instruments so sensitive and delicate, the heat of the body in a near approach would serve as a disturbing cause, and the telescopes are therefore placed in the centre of the room, and the distance of several feet respectively from each of the magnets. Thus the observer can, without moving from his seat, inspect and record all the instruments.

It was only as recently as 1838 that the magnetic and meteorological department was added to the Greenwich Observatory; the first observations being taken in the following year, in correspondence with those of Captain Ross in the Antarctic region, and of other observers stationed by the East India Company and by the East-India Company at various foreign stations. From the November of the following year, however, those systematic observations, properly data which have made this establishment so important, and which, for seven years, were carried on night and day, with the most unflinching care and accuracy. During the whole of this time, at every hour of the day (Göttingen mean time) the position of the three magnets was accurately observed, with the readings of the thermometers enclosed in their boxes; as were also the indications of the barometer, the dry and wet thermometers, the electrical instruments inspected, the direction and strength of the wind, the proportion of sky covered with and by what sort of clouds, and the different currents of the atmosphere noted. The dew-point also was observed four times a day, the quantity of rain measured as collected at four different heights above the ground; and, in addition to these, occasional observations were made on halos, comets, solar and terrestrial radiation, and the intensity of the sun's rays, &c. These observations were performed by mechanical devices

and by photography. Nature is made her own clerk, to register properly her various transgressions; and every observation is made by the aid of the sun.

Numerous as these duties appear, they are only a part of what has to be done, for all these data have to be reduced to their practical values by astronomical calculations.

The little plan annexed will show the arrangement of the three magnets. The first, or declination-magnet, is supported from pulleys at the top of a broad tripod stand 11 feet 9 inches high, by means of a skein of silk-fibre, in the state in which it is first prepared by silk-manufacturers, namely, when the fibres from the cocoon are united by juxtaposition only, without being twisted into a thread. This skein, too, is tied by little bands at intervals, so that the whole forms but one thread, and the individual fibres, in the breakage of individual fibres, the object being to get a steady suspension, without any tendency to twisting in the suspending cord, for such a tendency would, of course, exert a

contemning influence to the free play of the natural magnetical motions. The magnet vibrates within a double box, covered inside and outside with gilt paper, the object of which is to secure an equable temperature, and thereby to stop the play of atmospheric currents within the chamber of the box.

THE DECLINATION MAGNET.

A, a magnet, with lens and cross of corals, a flag as a coil; B, a copper surrounding bar for checking vibrations of magnet; C, mirror; D, a shell of silk fibre by which the magnet is suspended over the pulleys to F, G, and the cross-bar, &c., on the upright frame-work; A, a double action circular plate for adjusting the tilt of the silk fibre; I, a scale to which the suspending cord of the magnet is attached.

It has attached to it two small brass sliding frames, one carrying two plane glasses, between which is a cross of delicate corals, the other a lens of thirteen inches focus, and newly two inches aperture. This combination serves as a collimator: the cross of corals being seen through the theolite, and compared with its divisions, the action of the magnet is very accurately observed.

The object of the declination magnet is to determine the inclination of the magnet to the astronomical meridian; in other words the variation of the compass; and for this purpose the observing theolite-telescope can be turned away from the magnet towards a slit in the roof of the observatory through which the circumpolar stars can be seen as they pass the north astronomical meridian. The difference between the readings of the instrument when respectively turned towards the magnet or the meridian giving the magnetic declination.

The amount of declination has been found to be variable during the day, being at its maximum about 1 p.m., after which the magnet approaches the astronomical meridian, that is, its north extremity travels towards the east up to six or eight o'clock, when the declination has diminished by about ten minutes of a degree. The north end then recedes, afterwards commencing again its approaching movement, thus making two approaches and two recessions, or two easterly and two westerly movements every day, the mean diurnal change in the position of the magnet being about fourteen minutes of a degree in the summer and twelve in the winter. On some occasions it may exceed even an entire degree.

As the horizontal force magnet has a different duty to perform it is directed in every available way of all its other natural tendencies, just as when we want a tree to grow tall and straight, we lop off all its branches. The horizontal and vertical force magnets, having special duties, are placed at right angles to the declination magnet. In the horizontal magnet we do not need the lateral movements, nor in the vertical magnet do we require the lateral movements. The useless movement is therefore in each case respectively got rid of.

The declination magnet is suspended from a single skein of silk-fibre with every precaution taken against twisting. The horizontal force, on the contrary, is suspended by two skeins of silk fibre passing over two pulleys attached to the tripod-stand; which, like those of the other magnets, is fixed directly on piles, driven some distance into the ground to secure steadiness and prevent vibration, and all the telescopes are fixed in the same solid manner.

The object of suspending this magnet by two skeins of silk is to hold it, by their directive power, in a position transverse to the magnetic meridian. The natural tendency of the magnet is, as we know, to approach this meridian—or arrange itself north and south or parallel with the declination magnet; as the magnetic horizontal force, therefore increases more or less, it slightly twists the two suspending skeins, while the elasticity of these tends constantly to restore the magnet to its original artificial direction on a diminution of the magnetic force. By these simple yet delicate means the minutest variations of this magnet, such as would be imperceptible by the unaided eye, freely take place, and it only remains to find an adequate means of observing them. To do this, a mirror is attached to the centre of the magnet at such an angle that a scale of numbers painted on the wall opposite to the mirror is seen as reflected by it through the theolite telescope. The movements of the magnet are thus multiplied in apparent extent in proportion to the distance of the scale on the wall from the mirror, and the extent of the movements is shown by the various figures of the scale being reflected into the telescope, the angles thus shown being reduced by ordinary geometrical calculations.

The horizontal force magnet has, like the declination and vertical magnets its diurnal movements, none being the time when it is least drawn towards the north, after which there is a movement towards that point until about 6 o'clock; it then remains nearly stationary until 11 p.m., when the northerly movement recommences, again checked about 4 in the morning, but attaining at 6 o'clock its extreme northerly position.

GEORGE II.'S DAUGHTER.—"The Princess Emily," says Lord Hervey, "was lively, facile, and a greater liar," but he adds, as to the Princess Caroline, she "had affability without meanness, dignity without pride, cheerfulness without levity, and prudence without falsehood."

NECROLOGY OF EMINENT PERSONS.

THE EARL OF CAWDORE.

On Wednesday, November 7th, at Stockpole Court, Pembrokeshire, aged 79, the Right Hon. John Frederick Campbell, Earl and Baron of Cawdor, of Castle Martin, co. Pembrokeshire, and Viscount Emlay, of Emlay, co. Carmarthen, in the peerage of the United Kingdom, Lord Lieutenant of Carmarthenshire, F.R.S., and F.G.S., and D.C.L. of the University of Oxford. His lordship was the eldest son of John, 1st Lord Cawdor, by Lady Elizabeth Caroline Howard, eldest daughter of Frederick, 5th Earl of Carlisle, and was born November 8, 1780. He was educated at Christ Church, Oxford, and represented Carmarthen in Parliament from 1805

center, 1813, to the decease of his father, June 1st, 1821, when he succeeded to the family honours and estates. In 1827 he was created Earl and Baron Cawdor and Viscount Emlay. He married, September 5th, 1816, Lady Elizabeth Thynne, eldest daughter of Thomas, 2nd Marquis of Bath, by whom, who survives her husband, he leaves issue John Frederick Vaughan, Viscount Emlay, now Earl of Cawdor; Lady Caroline, married to the Hon. Octavius Duncombe; Lady Georgiana, married to Mr. John Balfour, of Balfour, N.B.; Lady Elizabeth, married to the Earl of Denbigh; Lady Mary, married to the Earl of Eglar; the Hon. and Rev. Archibald George Campbell, and Captain the Hon. Henry Walter Campbell, of the Coldstream Guards. By the succession of Lord Emlay to the earldom, a vacancy occurs in the representation of the county of Pembrokeshire in the House of Commons.

Lord Emlay was born on the 11th of June, 1817, and was married on the 28th of June, 1842, to the Hon. Sarah Mary Cavendish, one of the Queen's Maids of Honour, by whom he has issue. His lordship was formerly Private Secretary to the Earl of Aberdeen, and has resided at Pembrokeshire since 1841. He is a deeply-invested man in certain Carmarthen and Naime, and enjoys the patronage of twelve livings. The Campbells of Cawdor, as their name imports, are descended from the ducal house of Argyll, and their ancestors by the female side were "Thanes of Cawdor." They resided in the immediate vicinity of that more, originally a forest, situated between Eglar and Forre, where, according to Beethius and Shakspeare (who followed his authority), Macbeth met the "weird sisters," who prophesied his future greatness. The ancient Thanesdom, it is generally believed, was transferred from the ancient house of Cadder to the Campbells by the marriage of a Campbell with an heiress of the former house while she was still "a maid in her teens." If we are to believe tradition, a "young Lochinvar" was the chief agent in the transaction; for stealing an heiress was an incident not unusual in the olden days to which we allude, and it is said that it was by the abduction of the daughter of the Earl of Cawdor that the Campbells became to secure possession of the fair maid of Cawdor. The castle of Cawdor or Cadder, the property of the old Thanes, is, in the immediate vicinity of Naime, and has given a title to the present line of owners since the last century, when Mr. John Campbell of Stockpole Court, a descendant of the Earl of Cawdor, seated the borough of Cardigan for upwards of twenty years, was elevated to the peerage as Baron of Cawdor. He had signalled himself a few years previously by presenting himself at the head of a loyal body of gentlemen, assisted by a few regular troops or militia, to suppress the rebellion of the Jacobites of Pembrokeshire, who had landed near Fishguard, on the Pembrokeshire coast, to surrender at discretion. But the present castle is a comparatively modern building, with the exception of a single lofty square tower of the old edifice which still remains. The surrounding woods consist of fine birch, oak, and juniper, and venerable oaks; and amidst them rolls a mountain torrent now, as in the days of Macbeth.

The old castle (erected about A.D. 1160) has still its moat and "donjon keep," and is perhaps one of the most perfect specimens now extant of the old feudal fortress. The view from the top of the old tower, to which the house adjoins, is particularly fine; the tower consists of several stages, and all of the floors are still in an admirable state of preservation; and tradition used to point out to the visitor the very room in the tower in which Duncan was murdered by Macbeth—in this case used erroneously, for the scene of that transaction lies about ten miles distant—but the resident guides no longer palm that story off on the credulous. The ancient dining-hall is well worth a visit, with its varnished last painted wooden panels, restored in excellent taste, its musicians' gallery and its interesting series of family portraits.

The ancient tower a century ago attracted the admiration of Dr. Johnson; and the scenery of the neighborhood is wild and romantic in the extreme. The late Earl owned likewise two charming seats in the neighbourhood of the Court, near the sea, within a short distance of both Pembrokeshire and Tenby, and Golden Grove, Carmarthenshire, a house of venerable associations, which connects it with the memory of no less a personage than Jeremy Taylor.

GENERAL LYON.

On Sunday, the 11th inst., in Upper Brook-street, Grosvenor-square, after a few hours' illness, General the Hon. Edward Pym Lyon, C.B. He was the fourth son of the late Sir John Lyon, Bart., of the family of Lyon.

Beauchamp, by Katharine, daughter of James Dennis, Esq., and brother of the present (4th) earl; three brothers, William, John, and Henry, having succeeded in relation to the earldom. General Lyon entered the army as sub-lieutenant in the 5th Life Guards, joined the 1st Foot in Spain in 1812, was present at the battle of Vittoria, and served with his regiment in the Peninsula to the close of the war. In 1815, he accompanied the army to the Netherlands, and had the honor of commanding his regiment at the battle of Waterloo, in which he particularly distinguished himself, and received, in acknowledgment of his gallantry, the Companionship of the Bath, and the Russian Order of Saint Vladimir. He continued in command of the 5th Life Guards to 1827, when he was promoted to the rank of major-general, and for some years held the appointment of Inspecting General of Cavalry. In 1845, he was appointed to the colonelcy of the 13th

declared himself to be their advocate, was to make himself the adherent of a party which was excluded from office, and had little chance, with George III. as a king, of ever attaining power, and any consideration of the interests of the country was his political career a Whig. He did do a Whig. It is quite true he was dishonoured by the friendship of George, Prince of Wales; but when that prince was rescued upon the persecution of his wife, Sheridan at once separated from him, telling the cowardly persecutor of Caroline, he would "never take part against a woman who was right or wrong." In the public career of Sheridan, this fact might never have been forgotten, viz., that so long as he had a seat in the House of Commons, he stood almost alone in exposing the misconduct of Irish landlords, and the cruel oppressions practised with impunity upon the unfortunate Irish peasantry. There can be no better proof of a man's "sincerity" than his "consistency," and Sheridan, from first to last, was "a consistent Whig."

Thus much may be said in defence of Sheridan as a politician, when assailed in a book which, as it fills us with anecdotes, less useful, and a great deal of light gossip will, most probably, be very generally read.

MISCELLANEOUS NOTICES.

"Flowers, Grasses, and Shrubs; a popular Book on Botany." By Mary Price. London: James Blackwood, Paternoster-row.—A very pretty illustrated book on botany;—that branch of natural history which is most accessible to all, and is the poorest as to the rich. What we particularly like in the present volume is that it gives information as to the flowers, grasses, and shrubs which are most commonly to be met with. There is, too, a hearty, kindly, and religious feeling pervading the book, that cannot fail to make an agreeable companion, whether in the field and the garden, on the borders of the lake, or by the seashore.

"About London." By J. Ewing Ritchie. London: William Tinsley, 311, Strand.—The author of "The Night Side of London," "The London Pulpit," and "Here and There in London," has republished a collection of pleasant essays and shrewd remarks, to which he has given the title of "About London." It is a very agreeable book, upon a variety of subjects, treated with the skill of an accomplished writer, and with what is much rather, the just sentiments of an honest, honourable, and kind-hearted man.

"Tinsel and Gold; or, What Girls should Learn." A Tale. By Mrs. Veitch-London: T. Nelson & Sons, Paternoster-row, Edinburgh and New York.—This is a domestic tale, incalculating more than one useful moral. The great aim of the writer is to induce persons of moderate means so to educate their daughters that whenever they are married they may become useful helpmates for their husbands. The author is not for repudiating accomplishments; but her desire is to show that there is something more important for a young lady than a knowledge of French or music; namely, that she should be a practical, well-instructed, and efficient housewife; that a young woman should be able to do for herself all those things which she is rich, she will require servants to do for her; that she, too, should early learn the value of money, and know how to take care of it, and expend it—to do this so wisely, so judiciously, and so prudently, that, when married, her husband can repose in her hands all the care of the household, and so beyond his time and thought to the study of every vital concern to himself, his wife, and children, than the payment of the butcher's and baker's bills. "Tinsel and Gold" is a good tale, well told, very amusing, and substantially instructive.

"Little Lilly's Travels." By the Author of "Little Lilly's Sister Louisa." London: T. Nelson & Sons, Paternoster-row, Edinburgh and New York.—A child's book, written by one who has acquired an insight into a most difficult art—that is, writing a book which boys and girls will find a pleasure in reading, or hearing others read for them.

"Nephtes's Heroes; or, the Son Kings of England from Sir John Hawkins to Sir John Franklin." By W. H. Davenport Adams. With illustrations by M. S. Morgan and John Gilbert. London: Griffith & Farran (successors to Newbery & Harris), corner of St. Paul's Churchyard. The volume contains the biographies of Hawkins, Drake, Cavendish, Frobisher, Gilbert, Howard of Effingham, Blake, Montague (the buccannier Morgan and Dampier), Admiral Horbert, Sir G. Rooke, Beaulieu, Anson, Rodney, Cook, Perry, Sir Vincent, Nelson, Collingwood, Eschschott, Willoughby, Drton, James, Ross, Parry, and Franklin. The biographies are compiled from the best authorities, and the writer gives a list of the various works from which he has taken his statements, and to which he refers those who are desirous of possessing information more fully than he has supplied. The style is good, and Mr. Adams has performed his task in a manner which will render his "Nephtes's Heroes" a very welcome present to boys during the Christmas holidays.

"My Little Book." By Arthur Brown. London: James Blackwood, Paternoster-row.—This is stated to be the first volume of a literary autobiography; and yet more than one paper contained in it.—"The Fanstiel story in the World." "What is to be done with the Baby?" and the Boissierian story, have either appeared in print before, or it has so happened that we have read something very like them in the same way in the "Little Book" is that which appears to be the most original, a three-act comedy, entitled "Counting under Difficulties." Mr. Brown's humour is grotesque and extravagant; but still his book affords the proof that he possesses talents sufficient to justify him in the expectation that, with time and practice, he may become an agreeable writer. He must, however, endeavour to be less funny and more natural.

"The Marquise; or, Struggles in Life." By George E. Sargent. Illustrated by W. Dickens and H. Ansell. London: Henry James Trueman, 17, Ave. Maria-lane, Paternoster-row.—There is not much of originality either in the design or plot of this tale. A man of rank but independent fortune is misled by a know-nothing is induced to become a shareholder in a public company—in consequence deprived of all his property, confined a prisoner in "the Fleet," and his family, a son and daughters, reduced to absolute beggary. The interest of the book consists in describing the career of the man who has been so treated, and who is struggling manfully to regain the position which had been lost through the indiscretion of his father. Out of such simple materials there is constructed a very clever tale, conveying accurate pictures of life, and incalculating a valuable moral.

"Lost in Ceylon." By William Dalton, author of "The White Elephant," "The War Tiger," &c. With Illustrations by Harrison Ware. London: Griffith & Farran (successors to Newbery & Harris), corner of St. Paul's Churchyard.—

The most popular book of travels that has been published for many years is Sir Emerson Tennant's work on Ceylon. The book which Mr. Dalton has composed on the same subject is calculated to be as popular as the work of Sir E. Tennant's has been in the study and drawing-room. The natural wonders of Ceylon are made known in this volume through the medium of a fictitious narrative, in which a little lad and a young girl are described as wandering in "the western end of the lion king of Kandy." There is not a single incident introduced into the fictitious tale "that has not fact for its basis." The story so told is absolutely more strange than that containing the adventures of the renowned Robinson Crusoe. The author has a keen sense for natural beauties, and the pleasure he has himself experienced he endeavours to communicate to his readers.

"Guide to the Civil Service." By Henry White, M.A. London: P. S. King, Parliamentary Depot, 34, Parliament-street, Westminster. London: Marshall, Co.—This work has now reached a fourth edition. It embodies the substance of the five reports of the Civil Service Commissioners and the report of the recent Select Committee of the House of Commons. Much valuable information is given as to the mode of obtaining government appointments, and there is added a list of public office, the situations in them, and the salaries annexed. The selections from the examination-papers are calculated to be very useful to persons preparing themselves as candidates.

"Pride and his Priories." By A. L. O. E., authoress of "The Young Priories," &c. London: T. Nelson & Sons, Paternoster-row; Edinburgh and New York.—A well-intentioned mystery—a curious combination of story-telling, spoofing, sermonizing, and misquoting. The title is a little changed, and being tempted to the sin of "pride" by any extravagant praises bestowed upon so strange a metley as "Pride and his Priories."

MUSICAL PUBLICATIONS.

Mr. REDHEAD's collection of Hymn and Psalm Tunes, calculated for the use of the Church of England,* is an ample and exceedingly elegant volume, which will be found valuable and interesting to the lovers of our English ecclesiastical music. It has been compiled, the editor states, at a companion-book to two Hymnals, the "Salutary Hymnals" and the book of "Hymns and Introits adapted to the Seasons of the Christian Year." And in order that it may be used in conjunction with those books, there are two separate indexes, referring to the hymns contained in each of them, and indicating numerically the tone corresponding to each hymn. The hymn and psalm tunes are those which are most used in the Church of England, and the services of the church are performed in a manner corresponding to the magnificence of the building.

The volume contains no less than one hundred and seventy tunes, which have their corresponding words in the two books for which it is intended to be a companion. But it is obvious that they may be also sung along with any other words to which their rhythm and expression may make them suitable. It is somewhat to be regretted that the compiler has not indicated the sources from which the ancient melodies are derived. We have only the words of the Hymn Tunes, Ancient and Modern, as an index to the sufficient. The reader is thus enabled to trace the collections where the melodies are to be found, and thus to judge of the accuracy of the text; a thing which would have been more desirable as Mr. Redhead states that in harmonizing the ancient melodies, he sought the present mode of a musical hymn-singing in our churches, he has made such slight alterations in the melodies as appeared to him to be necessary. Now, though the melodies are harmonized in a musician-like manner, yet the harmonies are often of a modern cut, and we should have liked to see, by means of notation, to what extent the melodies have been modernized. We conceive that the ancient tunes ought never to be tampered with. Instead of altering them to fit them for modern harmony, their harmonies ought to be adapted to their antique character, which ought to be fully preserved.

The work is correctly printed, though with some exceptions. The tune No. 114, has the signature of two flats, though it is not in the key of B flat but F; and the final "Amen" chord ought to have been F and not an B flat, (their mistake might be printed out, but they are not such as to impair the value of the work.)

The Harmonium, as its mechanism has been progressively improved, has risen in importance, and come more and more into use among the higher circles of musicians, artists as well as amateurs. For the favour which it now enjoys, this instrument is much indebted to M. Louis Engel, whose fine performances often give it all the more attractions of our best concert, and make the public aware of the extent and variety of its powers.

The little book of which the title is given below, is a sequel or supplement to Mr. Engel's larger work recently published, on the same subject. Since the appearance of the first edition, the Harmonium has attracted the attention of those who received so many alterations and improvements, that new instructions for its use have become necessary; and these new instructions are contained in the "Method for Alexander's new Patent Drawing-room Harmonium," now before us. In this little treatise, Mr. Engel describes Messrs. Alexander's most recent improvements on the instrument, which have so wonderfully increased the beauty of the tones, the facility which it affords for the execution of every sort of passage, and the variety of effects which it is capable of producing; and he then explains the manner in which the whole, and each pedal, and other special mechanism are to be used by the performer; concluding with a series of appropriate and beautiful exercises.

We heartily recommend the Harmonium to the attention of our musical readers, not as a substitute for the piano-forte, but as an instrument, on over—but as a companion to that most indispensable of instruments. The Harmonium, from its comparative cheapness and small dimensions, may have a place by the piano in the drawing-rooms of any family of moderate means; and from the two instruments, whether used separately or in combination, a vast number of musical effects and enjoyments may be obtained. For the organ the Harmonium may be substituted in many cases. From its sustained tones, its swell, and variety of stops, it is well fitted for the performance of organ music; it is a finer and more powerful instrument than the organ of the same size, and therefore, for the church-chamber, but for the smaller chapels and other places of religious worship. It requires the same mode of fingering and the same kind of "touch" as the organ; so that a student who practices on the Harmonium improves himself at the same time as an organist.

* Ancient Hymn Melodies and other Church Tunes. Arranged, composed, and harmonized by Richard Redhead, organist.

* Method for Alexander's new Patent Drawing-room Harmonium. By Louis Engel. Published by Messrs. A. & Co.

BY THE RIVER.

I.

I'm an old, old man, and river;
I'm old and like to those,
That poorest thy weedy waters
To the all-engulfing sea;
And I dream on thy mournful margin
Of the darkening days to be.

II.

Thou art deep, and wide, and wealthy;
And the balm ships come by,
With the wine, and the corn, and the ingots,
Their white sails flapping high;—
But thou'st had thy fill of treasure,
And scorn it—as do I.

III.

There's an unknown world before us,
A cold and stormy gloom,
That shall gather us up, and river,
In the darkness of our doom:
There in the deep, deep ocean,
Me in the yawning tomb.

IV.

Let us dream of the past, O river!
And the joyous days of old,
When thou wert a babbling brooklet,
On the hill-side, and the world;
And I was a laughing urchin
With hair like the woven gold.

V.

When we were glad in the sunline,
And stray'd by the birken bowers;
When we sang, and hop'd, and frolick'd,
And play'd with the meadow flowers;
While the laughter of girls made music
In our morn and evening hours.

VI.

Ere away—far away—we hurried
To the world of strife and care,
To the melancholy pine-woods,
And heard in the upper air
The wail and the rush of tempests
That shook the forests bare.

VII.

Away to the roaring rapids,
All white with crested foam,
Impatient of obstruction,—
Where vessel never clomb;—
Vagrant, and wild, and reckless,
Intolerant of home.

VIII.

In recklessness of vigour—
Erebrant in glee,
'Twas vain for solid Wisdom
To preach to such as we,
That heeded not Experience,
And knew not of the sea.

IX.

'Twas vain to speak of quiet
To us who hop'd and ran;
Who scorn'd to curb existence
By measurement and plan;
Who courted Toil and Peril,
And thought the world a span.

X.

On to the falls we hurried,
Exulting in our way,
And dash'd o'er the chasma in thunder
Through the bog, long night and day;
But even in mid-day sunshine
With rainbows in our spray.

XI.

And then we flow'd, O river!
Through the rich and level ground,
Through the corn-fields and the meadows,
With a calm and rippling sound;
By the church upon the hill-top,
And the hamlet lying round.

XII.

Unresting and impatient,
We thought of the wealthy shores;
Of the wharfs and docks far distant,—
Of the cupolas and spires;
And all the splendid city
That shone through our desires.

XIII.

And thither we came, O river!
Thither we came at last,
And flow'd with gentle current
By stores and granaries vast,
And heard the roar of people
And the chariots rushing past.

XIV.

We bore upon our bosoms
The corn—the wine—the oil,—
The tribute of the ocean,
And all the green earth's spoil:
Whatever men delight in,
As recompense of toil.

XV.

But alas for us! O river!
Flowing through paths unclean,
We lost the fairy freshness
Of the days that once had been,—
The flowers of woodland meadows,
And the sky's blue depths serene.

XVI.

No more the blithe lark cheer'd us
A mile above his nest,
No more the milk-maid chanted
Of Love, and Love's nurse;
Or children gather'd daisies
To float them on our breast.

XVII.

And we stray'd from the busy city
With all its weary gold,
In search of the health and pleasure
We lost in the days of old,
Ere the youthful heart was harden'd,
Or the fire of life was cold.

XVIII.

Never! oh, never! never!
Shall Time these gifts restore;
For the salt, salt waters meet us,
Upflowing ever more,—
From the depths of the bitter ocean,
And the ever-widening shore.

XIX.

I stand on the mournful margin,
And hear what the deep sea saith.
There are storms and cloud above it,
And a low long wailing breath;—
'Tis for thee and for me, O river,
And it culled us down to Death.

C. M.

PRIVATE AS COMPARED WITH PUBLIC MISFORTUNES.—Lord Hervey, in his "Memoirs of the Reign of George II.," makes the following distinction between what are considered "public" as compared with what are felt to be "domestic" calamities:—"With regard to states and nations, nobody's understanding is so much superior to the rest of mankind as to be missed in a week after they have gone; and with regard to particulars (individuals) there is not a great landlord that breaks who does not distress more people than the disgrace or retirement of the greatest minister that ever provided in a cabinet; nor is there a deceased ploughman who leaves a wife and a dozen brats behind him, that is not lamented with greater sincerity, as well as a loss to more individuals, than any statesman that ever wore a head, or deserved to lose it."

POLITICAL WARFARE IN IRELAND.—Sir John Barrington stated that, when the Act of Union was under discussion, Lord Castlereagh invited twenty or thirty of his staunchest supporters, of "fighting families," to a dinner, at which a formal proposal was made by Sir John Blandford, and received with acclamation, that they should make the measure a personal question, and compel the leaders of the opposition to accept the arbitrament of the pistol or the sword. Mr. H. Grattan, in his Memoirs of his father, confirms the statement, and adds: "It was said they had singled out their man: that Lord Castlereagh should attack George Ponsonby; Corry, Mr. Grattan; Daly, Mr. Plunkett; Toler, Mr. Bashes; and Martin, Mr. Good."

SHAKESPEARE.—The forgery of Shakespeare Portraits has flourished more widely than any other forgery upon his immortal name. Referring to Mr. Elphinstone's interesting work, we may note also the remarkable "Illustrations of Shakspeare," by George Tollet, who died some eighty years ago, and was the nephew and heir of Mrs. Tollet, the poetess and friend of Sir Isaac Newton. This lady, who bestowed much research upon Shakspearean subjects, states that there is no genuine portrait of him, and the one received as just was taken long after his death, at the charge of Sir Thomas Charnock, from a person supposed to be extremely like him.

THE IMPROVED PATENT HARMONIUMS.

MANUFACTURED BY ALEXANDRE & SON, OF PARIS.

CHIEF WHOLESALE AGENTS: METZLER & CO.,

37, 38, & 35, GREAT MARLBOROUGH STREET, LONDON,—W.

ALEXANDRE'S HARMONIUMS are universally admitted to excel all others in durability, and in the power and quality of their tone; and as they rarely require tuning, and give no trouble in their management, they are coming daily into more general use.

The following is a complete List of all the Instruments manufactured by them, forming a large Assortment, suitable for either the Church, School, or Drawing-Room.

PRICES.

| | |
|--|-----------|
| No. 1.—In Oak Case, Four Octaves, One Row of Vibrators | 4 Guinea. |
| 2.—In Mahogany Case, Four Octaves, One Row of Vibrators | 7 |
| 3.—In Oak Case, Five Octaves, One Stop, One Row of Vibrators (Wind Indicator) | 10 |
| 4.—In Mahogany Case, Five Octaves, One Stop, One Row of Vibrators (Wind Indicator) | 13 |
| 5.—In Oak Case, Five Octaves, Three Stops, One Row of Vibrators (Wind Indicator) | 18 |
| 6.—In Oak Case, Five Octaves, Five Stops, Two Rows of Vibrators | 22 |
| 7.—In Oak Case, Five Octaves, Nine Stops, Two Rows of Vibrators | 25 |
| 8.—In Oak Case, Five Octaves, Thirteen Stops, Four Rows of Vibrators | 33 |
| 9.—In Rosewood Case, Five Octaves, One Stop, One Row of Vibrators | 13 |
| 10.—In Rosewood Case, Five Octaves, Three Stops, One Row of Vibrators (Wind Indicator) | 15 |
| 11.—In Rosewood Case, Five Octaves, Five Stops, Two Rows of Vibrators | 19 |
| 12.—In Rosewood Case, Five Octaves, Nine Stops (Triads) Two Rows of Vibrators | 27 |
| 13.—In Rosewood Case, Five Octaves, Thirteen Stops (Triads) Four Rows of Vibrators | 37 |

WITH THE PATENT PERCUSSION, OR PIANOFORTE HAMMER ACTION.

The invention of the Patent Percussion Action has entirely removed the sole objection to these admirable Instruments—want of articulation when used for Pianoforte Music. It consists of a set of Hammers which strike the Vibrators at the same moment that the key is admitted, thus facilitating the execution of the most brilliant and rapid passages, and also producing a fuller and very superior quality of tone, and imparting to this instrument all the advantages of the Pianoforte.

| | |
|--|------------|
| No. 14.—In Rosewood Case, Three Stops, One Row of Vibrators | 20 Guinea. |
| 15.—In Rosewood Case, Nine Stops, Two complete Rows of Vibrators | 33 |
| 16.—In Rosewood Case, Thirteen Stops, Four complete Rows of Vibrators | 45 |
| 17.—In Rosewood Case, Twelfth Stops, Four complete Rows of Vibrators, and 11 Octaves of Pedals (separate Vibrators), with Bellows Handle | 60 |

NEW DRAWING-ROOM MODEL, WITH KNIFE SWELL, SEPARATE HANDLE TO WORK THE BELLAWS, AND PERCUSSION ACTION.

THE MOST PERFECT YET MADE.

| | |
|---|------------|
| No. 18.—In Rosewood Case, Five Octaves, Three Stops, One Row of Vibrators | 21 Guinea. |
| 19.—In Rosewood Case, Five Octaves, Eight Stops, Two Rows of Vibrators | 30 |
| 20.—In Rosewood Case, Five Octaves, Thirteen Stops, Four and a half Rows of Vibrators | 40 |

HARMONIUMS ESPECIALLY ADAPTED FOR CHURCHES AND CHAPELS.

| | |
|--|------------|
| No. 21.—In Oak Case, with Gothic Organ Front and Gilt Pipes, rich full tone, Eight Stops (Two complete Rows of Vibrators) | 33 Guinea. |
| 22.—In Oak Case, with Gothic Organ Front and Gilt Pipes, rich full tone, with Twelve Stops (Four complete Rows of Vibrators) | 43 |
| 23.—In Oak Case, with Gothic Organ Front and Gilt Pipes, rich full tone, with Percussion | 53 |
| 24.—In Oak Case, with Twelve Stops (Four complete Rows of Vibrators), with 11 Octaves of Pedals (separate Vibrators) | 60 |
| 25.—In Oak Case, with Sixteen Stops (8½ complete Rows of Vibrators in the Treble, and Four in the Bass), Transposing Action | 45 |

A large assortment of the above-named Instruments always on hand.
N.B. No extra charge for packing.

TUTORS FOR THE HARMONIUM.

| | |
|---|---------|
| Egell's Complete Instructions (with or without Stops) | 3s. 6d. |
| R. Sloan's Complete Instructions for the Drawing-Room Model | 2s. 6d. |
| Frederic's Manual, containing a full explanation of the use of the different Stops, &c. | 6s. 6d. |

And a variety of Harmonium Music by well-known Composers.

Manchester MESSRS. FILDES & RUTCLIFFE, Marsden Street, Manchester.

Leeds THOMAS E. FLINT, Esq., Park Row, Leeds.

SECRETARY.—STEPHEN JAMES GREEN, Esq.

OFFICES:—113, FENCHURCH STREET, LONDON, E.C.

PROSPECTUS.

FREEHOLD LAND is universally acknowledged as the only real security for the Investment of Capital. Such is its importance in GREAT BRITAIN that it commands a higher price than any other species of property; and in AMERICA, AUSTRALIA, and all CIVILIZED STATES, its value is continually increasing. In new countries the largest fortunes have been realized by the purchase and sale or cultivation of Land.

THIS COMPANY is formed for the purchase and development of a valuable FREEHOLD PROPERTY, known as the GREAT KANAWHA ESTATE, comprising 85,000 acres, or about 125 square miles of FREEHOLD LAND, in the centre of the UNITED STATES, on the north-west Border of the primary State of Virginia. It stands on high and hilly ground, with a valuable frontage to the Great Kanawha River, and within thirty miles of its confluence with the Ohio. The Soil is naturally rich, well irrigated, and yields, with little labour, a constant succession of Cereals. The TRINITY is abundant and valuable. The Coal, of a high-class bituminous character, has been analyzed, and found to be well adapted for both domestic and manufacturing purposes. IRON ORE and HOLDING-STONE exist in great abundance. The Estate is watered by two principal streams and numerous small tributaries, affording a ready conveyance to the Great Kanawha for Timber, and supplying water-power, at various points, sufficient to propel machinery.

THE GREAT KANAWHA RIVER is navigable for 70 miles from its junction with the Ohio; Steamers ply regularly from Cincinnati, and other ports on the Ohio, to the Salt works on the Great Kanawha, 30 miles above the Estate, maintaining a regular intercourse throughout an immense territory. A great part of the Corporation and Ohio Railway is already completed, and in operation, and the Legislature have appropriated funds towards finishing it. It will pass in front of and near to the Estate, connecting the Atlantic with the Ohio, and forming a continuous chain with the entire railway system of the Union.

The plan of Operations for the development of this Estate is as follows:—

THE SURFACE LAND.—A very large part is good farming and grazing land, which it is proposed to sell in Sections. From the numerous applications to purchase, it is estimated that sales to a considerable amount will be effected on the formation of the Company. The Settlers on the Lands so disposed of will materially increase the value of the Sections reserved.

TIMBER.—From this source it is expected a large amount will be realized. The whole Tract is covered with an abundance of valuable Timber, of various kinds, for which there are ready markets, at good and remunerative prices.

COAL.—The Estate abounds in Coal of first-class character and various descriptions, suitable for domestic and manufacturing purposes. The Mineral survey proves the seams to be numerous, varying from 4 to 15 feet in thickness, and to extend

under about 15,000 acres. These can be worked by levels driven into the hill-sides, and at favourable gradients for shipment to all the great markets in the Ohio and Mississippi Valleys, containing a population of about ten millions. In addition to the demand created by this vast population, there are about 1,000 steamers plying on these important rivers, which would take a large proportion of their supply from the Company's Depots.

IRON.—The result of the Mineral researches shows that Iron Ore of rich character exists in large quantities on the Estate, with abundance of Limestone contiguous thereto; also Building stone of the best quality.

After a careful estimate of the various sources of revenue, it is estimated, with great confidence, that the net profits will yield an immediate dividend of 10 to 15 per cent. per annum, and that it will gradually increase; also that from the sales of Land, Shareholders will be reimbursed their entire Capital within a comparatively short period.

The Directors have provisionally contracted for the purchase of this ESTATE, including all Timber, Coal, Minerals, and Rights, at the sum of £127,500, of which the Vendor has agreed to take a large amount in Shares of the Company, and to extend the Cash payments over a series of years. The Title has been investigated and approved by Messrs. Barney, Butler, and Parsons, the eminent Solicitors in New York, selected for that purpose by Messrs. Marten, Thomas, & Hollams, the Company's Solicitors.

No Shareholder will incur any Liability beyond the amount of the Shares allotted to him.

The Directors intend to proceed with the operations of this Company when such an amount of capital as they are assured will be adequate has been subscribed.
